A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,

VOLUME V.

NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY
1881

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA.** The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

DISRAELI, BENJAMIN, Earl of BEACONSFIELD, author and statesman, eldest son of ISAAC, was b. in London, 1805; he received a private education, which was carefully superintended by his father. At the age when most other young men who rise to political distinction are sent to a university, he was articled to a solicitor, with a view of qualifying him for a situation in a government office, which had been obtained for him by his father. The drudgery of a lawyer's office being distasteful to him, he contributed to a tory journal, the *Representative*, which came to an untimely end. In 1827, he published his novel *Vivian Grey*, which was succeeded at intervals by other brilliant works of fiction, including *The Young Duke; Contarini Fleming; The Wondrous Tale of Alroy;* and *Henrietta Temple.* He also wrote *The Rise of Iskander; A Vindication of the British Constitution;* and *The Revolutionary Epic.* After visiting Italy, Greece, Turkey, and Syria, he returned to England, to find the country involved in the reform bill agitation. His sympathies appear now to have inclined to radicalism in politics; and having obtained recommendations from Mr. Hume and Mr. O'Connell, he presented himself in 1832 to the electors of Wycombe, but was defeated. At the general election in 1835, he met with no better success. In April in the same year, he contested Taunton on conservative principles, but again without success. In 1837, his desire for a political career being unabated, he contested Maidstone in the conservative interest along with Mr. Wyndham Lewis. He was elected, and at the age of 32 took his seat in the house of commons. His maiden speech, which was in a high-flown style, and delivered with extravagant gestures, excited the laughter of the house of commons. He was so much disconcerted, that he stopped short abruptly, but not without uttering the remarkable prophecy: "I shall sit down now, but the time will come when you will hear me." In 1838, Mr. W. Lewis died, and in the following year D. married the widow of his late colleague. He then carefully studied the style of successful parliamentary orators, making few speeches. It was not till 1849 that he began to attract notice, and not long afterwards he gained the ear of the house as the leader of the Young England party. After entering parliament, D. wrote several novels—*Coningsby* (1844); *Sybil* (1845); and *Tancred* (1847), in which the principles of Young England are most ingeniously blended with theories about the intellectual supremacy of the Jews, inaccurate scientific notions, and misconceptions of English social life. At the general election in 1841, he obtained a seat for Shrewsbury. He then became the organ of the dissatisfaction with which the landed aristocracy and country gentry regarded sir Robert Peel's relaxations of the system of protection to native industry. His brilliant invective and polished sarcasm inspired the protectionist party with fallacious hope and confidence. On the death of lord George Bentinck in 1848, D. succeeded to the leadership of the protectionist party in the commons. He bore generous testimony to the political consistency and private worth of his predecessor in his *Lord George Bentinck, a Biography.* In 1852, the earl of Derby, having undertaken the construction of a cabinet, offered him the post of chancellor of the exchequer. It was the first time a brilliant novelist had ever figured as the finance minister of a great commercial state, and it argues well for the versatility of his genius that he emerged with honor and credit from the ordeal. His second budget, in 1853, failed, however, to find acceptance with the house of commons, and the government being outvoted upon it, the Derby cabinet ceased to exist. D. resumed the leadership of the opposition, from which he was again summoned in 1858, to fill the post of chancellor of the exchequer in the second administration of lord Derby. In 1859, he introduced a measure of parliamentary reform, which, being thrown out, was followed by the resignation of the government. For seven years the liberals remained in power, and Mr. Disraeli, in opposition, displayed talents as a debater, and a spirit and persistency under defeat, which won for him the admiration of his opponents. When lord Derby returned to power in July, 1866, D. again returned to the post of chancellor of the exchequer. It was he chiefly who induced the conservative party to pass the reform bill of 1867, his argument being, that the working-class householders are more conservative than those to whom the franchise had been previously extended. In Feb., 1868, D. succeeded lord Derby as

premier, but, in the face of a hostile majority, he resigned in the following Dec. On this occasion, Mrs. Disraeli, in acknowledgment of her husband's services, was raised to the peerage as viscountess Beaconsfield (died 1872). In 1870, D. published another novel, *Lothair*, marked by most of the merits and defects of those which preceded it. In 1873, the popularity of Mr. Gladstone subsided, and the election of 1874 giving the conservatives a large majority, D. returned to power as prime-minister. In 1877, D. took his seat in the upper house as earl of Beaconsfield. Still premier, the earl was the guiding spirit of his cabinet during the critical years 1877–78, seeking by energetic action in eastern affairs to give an "imperial" character to English policy; and he returned from the congress of Berlin bringing, as he said, "peace with honor." He is LL.D. of Edinburgh, D.C.L. of Oxford, has twice been lord rector of Glasgow university, and holds many other honorary offices and titles.

DISRAE'LI, ISAAC, D.C.L., a well-known English author, was the descendant of a Hebrew family which flourished first in Spain, and afterwards in Italy. His father, Benjamin D'Israeli, came to England in 1748, entered into business in London, amassed a fortune while yet in middle life, and retiring to Enfield, there died in 1817, aged 90. His son Isaac, born at Enfield in 1766, was educated at Amsterdam and Leyden. He commenced his career as a poet and novelist; but, after the publication of the first volume of his *Curiosities of Literature* (1791), he discovered that his forte lay not in creative literature, but in the illustration of history and literary character, and to this he devoted himself. His style is elegant and pleasing, presenting the fruits of antiquarian research and study without their dryness and general want of connection. No writer is more instructively amusing or amusingly instructive than he. Lord Byron speaks of him as "that most entertaining and searching writer." D. died in 1848.

D.'s principal works are the *Curiosities of Literature* (1791–1823; new edition, with Life, Lond. 1851); *A Dissertation on Anecdotes* (1793); *Essay on the Manners and Genius of the Literary Character* (1795, 14th ed., 1850); *Inquiry into the Literary and Political Character of King James I.* (1816); *Commentaries on the Life and Reign of Charles I.* (1828–31); *Eliot, Hampden, and Pym* (1832); *Amenities of Literature* (1841)—for which he received from the university of Oxford the honor of D.C.L.

DISRUPTION, the name generally given in Scotland to the famous act of 1843, by which upwards of 400 ministers of the church of Scotland (nearly two fifths of the whole) left their churches and manses to vindicate principles which they conceived to be essential to the purity of that church, and in harmony with its earlier history. The word D. was probably chosen to indicate that these ministers did not look on their act as a *secession* or *dissent* from the church of Scotland, but as a *split* or *division* within it, and the body immediately after formed by them assumed the name of the free church of Scotland. See FREE CHURCH.

DISS, a market-town of the co. of Norfolk, England, on the right bank of the Wavency, 19 m. s.s.w. from Norwich. It is a station on the Great Eastern railway. The town stands on the slope of a hill; its streets are narrow, but many of the houses very good. There are brush manufactories and breweries. The church of St. Mary is a large and handsome Gothic building. Pop. '71, 3,851.

DISSECTION. See ANATOMY, in Law.

DISSECTION WOUNDS. The practical study of anatomy is attended with certain dangers, which, however, during the last quarter of a century have been much lessened. The atmosphere of the dissecting-room, now comparatively pure by the application of proper ventilation and other sanitary measures, was, less than a generation ago, too commonly loaded with noxious emanations, which more or less poisoned the blood of those who continuously inhaled it, and consequently produced nausea, sickness, diarrhea, a bad taste in the mouth, and other symptoms. D. W., which are always attended with a certain amount of risk, were rendered more dangerous by the low state of the system, induced by the depressing influence of the surrounding air. Now, probably in consequence partly of the purer air, and partly of the general and extensive use of antiseptic injections into the vessels of the subjects to be dissected, it rarely happens that severe symptoms follow a cut or puncture. We may incidentally remark that a puncture in making a post-mortem examination, when the body is comparatively fresh, is much more likely to be followed by serious consequences than a wound in the dissecting-room in which the bodies have been lying for some weeks.

In the great majority of cases, punctures or cuts in the dissecting-room are followed by no unpleasant results; it being an established rule, that every puncture should be carefully sucked as soon as it is observed, and then freely touched with nitrate of silver. When, however, the poison has been absorbed, and is going to act, the patient begins to have a feeling of general illness in less than 24 hours. He is low-spirited, faint, and chilly, and often complains of nausea. Then come rigors, intense headache, rapid and sharp (but weak) pulse, a coated tongue, vomiting (sometimes), and great restlessness. The first local symptom is intense pain in the shoulder of the wounded side, which is followed by fullness of the neck and armpit, extending in the form of a doughy swelling down the side of the trunk, and assuming a pinkish tint.

The general symptoms increase in severity, the breathing becoming difficult, the

pulse very rapid and weaker, the tongue dry, brown, and often tremulous when protruded, and the skin more or less yellow. The case may terminate fatally at or before this stage; or abscesses may continue to form, from which the patient may more slowly sink; or if he survive, the arm may remain stiff and useless, or some of the fingers may be destroyed by gangrene. In the article POISONS we have noticed the rapidity with which death occasionally ensues in these cases. The essential points of treatment are briefly summed up as follows by Dr. Druitt in his excellent remarks on this subject in *The Surgeon's Vademecum:* "The indications clearly are to eliminate the poison from the blood; to support the strength; and to relieve pain, and promote the discharge of pus or sloughs." The treatment, both general and local, is, however, so similar to that of pyæmia, that it is sufficient to refer our readers to that article.

As a precautionary measure in post-mortem examinations, the surgeon, especially if he be out of health, or if the patient have died from a disease of an erysipelatous character, should thoroughly anoint his hands with lard. Very thin india-rubber gloves have been recommended as a safeguard to dissectors; but they have not been found to answer; probably from the constraint to which they subject the action of the fingers.

DISSEISIN. See SEISIN.

DISSENTERS, the common appellation of those who dissent or differ from the established church of their country in any of its doctrines, or in any part of its constitution, and therefore separate themselves from it. Although sometimes employed as a sufficiently appropriate designation of the sects which separated themselves from the general body of the church during the early and middle ages, the term D. belongs to modern times and Protestant countries; the claims of the Roman Catholic church, where dominant, having always been asserted in a manner incompatible with the existence of recognized religious dissent. The measure in which the rights of D. are conceded by law, may be esteemed a fair test of the religious liberty enjoyed in a country, and of the general enlightenment of a people. The term D. is of English origin and growth, although its almost exact equivalent may be said to have existed in Poland in the name *dissidents*, a term which first appears in the acts of the Warsaw confederation of 1573, and there denotes the Polish Protestants, in contradistinction to the members of the established Catholic religion. After 1632, the term dissidents was applied in Poland to all who were not Roman Catholics, such as Lutherans, Calvinists, Greeks, Armenians, etc.

In England, the term D. appears to have come into use in the 17th c., as synonymous with *nonconformists;* and from England its use was transferred to Scotland in the 18th c., after the Secession (q.v.) church had been founded in that country. It is usually applied to those who agree with the established church in the most essential doctrines, but differ from it on some minor point, or on questions of church-government, relation to the state, rites, etc., as in England to Presbyterians, Independents, and Baptists. The claim of the church of Rome to be regarded as the *Catholic* church prevents its members from accepting the name D., and others seldom seek to apply it to them. On somewhat similar grounds, it is rejected by *Episcopalians* in Scotland; and for very different reasons, to be found in the peculiar circumstances which attended their growth, the *Methodist* (q.v.) churches are seldom included in it, as ordinarily used. See ESTABLISHED CHURCH, NONCONFORMISTS, PURITANS, UNITED PRESBYTERIAN CHURCH, TOLERATION, etc.

The term D. is not strictly legal or ecclesiastical, those to whom it applies being usually described in legal language by a periphrasis. It may be said to be a convenient term to designate those Protestant denominations which have dissented from the doctrine and practice of the church as by law established. Immediately after the reformation, D., or nonconformists, as they were then called, were subjected to severe restrictions and penalties. "During the rebellion, the laws against Protestant sectaries were repealed: but they revived at the restoration; and the parliament of Charles II. proceeded to enforce systematically, by new measures of vigor, the principle of universal conformity to the established church."—Stephen's *Com.*, iii. 53. By 1 Will. and Mary, c. 18, the restrictions on D. were first relaxed, and certain denominations were suffered to exercise their own religious observances. From that period, various statutes have been passed, each extending in some degree the free exercise of religious opinion. At the present time, D. of all denominations are allowed to practice without restraint their own system of religious worship and discipline. They are entitled to their own places of worship, and to maintain schools for instruction in their own opinions. They are also permitted, in their character as householders, to sit and vote in the parish vestries. A dissenter, if a patron of a church, may also exercise his own judgment in appointing a clergyman of the church of England to a vacant living. See on this subject, Stephen's *Eccles. Law.*

A similar amount of religious liberty is enjoyed in Scotland, not so much derived from or guarded by special statute; fully recognized, however, by decisions of courts, as belonging to the law of the country.

Since the beginning of the 18th c., the Presbyterian, Independent or Congregationalist, and Baptist denominations in England, have been associated under the name of the *Three Denominations.* This association was fully organized in 1727, and enjoys—like the established clergy of London and the two great universities—the remarkable privi-

lege of approaching the sovereign on the throne. Notwithstanding much weakness, arising from doctrinal and other differences, this association has contributed much to promote toleration and religious liberty in England.

DISSEPIMENT (Lat. *dissepio*, I separate), in botany, the partition between two carpels (q.v.) in an ovary or fruit composed of a number of carpels. A D. is formed by the union of the sides of two carpels. Sometimes dissepiments meet in the center or axis, completely dividing the ovary or fruit into cells; sometimes they are partial, appearing as mere projections from the outer walls of the ovary or fruit, and leaving it one-celled. Many ovaries and fruits exhibit partitions not formed by the union of the sides of carpels; these are sometimes called *spurious dissepiments*.

DISSOCIATION, or DISASSOCIATION, a word belonging to the nomenclature of chemistry, first adopted by Henry St. Clair Deville to express the influence of heat in the decomposition of compound bodies. In a paper presented to the French institute, 1857, he says that "by selecting a proper compound and heating it sufficiently, the distance between the molecules can be increased to such extent that they will separate into their elementary conditions." He holds that water may be thus dissociated into its constituent elements at the temperature of melted silver. Deville placed a tube of porous porcelain within a tube of glass, and provided each with a separate outlet. He passed hydrogen through the inner tube, and carbonic acid through the annular space; both the gases passed through the pores of the septum, and a combustible gas issued from the carbonic acid tube. Thus far the experiment was not new. He now placed the tubes in a furnace heated to between 1000° and 1300° C., and substituted steam for the hydrogen of the inner tube. Part of the steam was decomposed, the hydrogen passing through the porous matter to the outer tube, and a corresponding portion of carbonic acid entering the inner tube by the same route. Some hydroden was lost by combining with oxygen of the carbonic acid, $CO_2 + H_2$ yielding $CO + H_2O$. From the inner tube came steam, carbonic acid, and oxygen, from which the oxygen was easily isolated; from the outer tube came steam, carbonic acid, carbonic oxide, and hydrogen, from which the hydrogen was also isolated. If the carbonic acid of the process were derived from the furnace which furnished the heat, and the steam were generated by the same heat, there results from the heating of water in this apparatus a certain quantity of separated oxygen and hydrogen, which might be used for the production of light and heat. By a modification of this process, sulphurous acid was separated, at 1200° C., into sulphur and anhydrous sulphuric acid; hydrochloric acid into hydrogen and chlorine; carbonic oxide into carbon and carbonic acid; and carbonic acid into carbonic oxide and oxygen. The economic value of this discovery is yet a problem. Lamy has applied it to the preparation of a pyrometer for showing high temperatures.

DISSOLUTION OF MARRIAGE. See DIVORCE.

DISSOLVING VIEWS are pictures painted upon glass, and made to appear of great size and with great distinctness upon a wall by means of a magic lantern with strong lenses and an intense oxyhydrogen light, and then—by removal of the glass from the focus, and gradual increase of its distance—apparently dissolved into a haze, through which a second picture is made to appear by means of a second slide, at first with a feeble, and afterwards with a strong light. Subjects are chosen to which such an optical illusion is adapted, such as representations of the same object or landscape at different periods. Dissolving views were invented and first exhibited as a popular entertainment in England.

DIS'SONANCE is the opposite of consonance, and is applied to those intervals in music whose relative proportions are to a certain extent unsatisfactory to the ear, and produce a degree of disquietude. In a special sense, the term dissonance is applied to the interval causing the unpleasant effect; which sound is not always, as some think, the upper note, but may be the middle or the lowest note. Many believe that the feeling of dissatisfaction produced by the dissonances of music, arises from the mind not being able without difficulty to comprehend at once the arithmetical proportions of the vibrations. The foundation of dissonance, however, is generally allowed to be more æsthetical than intellectual, as through the vibrations of a sounding body the air is put into a similar state of vibration, which is communicated to our ear, and so to our whole nervous system, through which we obtain the inward feeling representing the sound. In music, dissonance may be called a necessary æsthetical evil, which is used in the finest musical works for the purpose of producing pleasing contrasts, with their resolutions. In modern music, dissonance is divided into *essential* and *accidental;* the former arising fundamentally, the latter arising from passing notes, anticipations, suspensions, etc. See HARMONY.

DISTAFF, the staff on which the flax or wool is fastened, and from which the thread is drawn in spinning. A distaff of a very elegant construction is represented in art, and was no doubt generally used in antiquity. It is made of a cane-stick, the top of which is slit in such a manner as that the portions, when bent downwards, form a receptacle for the flax or wool. A ring was put over the top, for the purpose of keeping the divided ends of the cane together. The distaff was dedicated to Pallas; and the Fates are always represented with it, and engaged in spinning the thread of life. It has ever

been considered as the peculiar emblem of feminine as opposed to male occupations, and has come to be used figuratively for a woman.

DISTANCE. The limit of view in a picture, or *point* of *distance*, as it is called in perspective, is that portion of the picture where the visual rays meet; the *middle distance* being the central portion between the extreme distance and the foreground. The art of producing on the eye the effect of real distance, in so far as it is not accomplished by mere mechanical rules, is one of the most subtle branches of landscape-painting, and cannot be acquired otherwise than by long experience, and a careful study of the effects of light and shade.

DISTEMPER (Fr. *détrempè*), a coarse mode of painting, in which the colors—of a commoner kind than those usually employed for artistic purposes—are mixed in a watery glue, such as size and whiting. The chief purposes for which distemper is now used are scene-painting and staining-papers for walls. But it is known that the old masters frequently executed pictures and portions of pictures in distemper, and then oiled them, by which means they acquired the character of being painted originally in oil. It is said that Paul Veronese sometimes began his pictures in distemper, and finished them in oil, and that he frequently painted his skies in distemper. Distemper is often ignorantly supposed to be identical with fresco (q.v.). The difference is, that whilst in the former the colors are laid on a dry surface, in the latter they are put on wet mortar or plaster. See GELATINE.

DISTEMPER is a typhoid inflammation affecting the upper air-passages of young dogs, and resembling in many respects the strangles of young horses, and the scarlatina and other such complaints of children. Like these, it is generally contagious, occurs only once in a lifetime, runs a definite course, is accompanied by low fever and debility, and is most successfully treated by good nursing and attention to diet and regimen. The eyes are red, weak and watery; the nose dry and hot; draughts of air or movements of the animal readily excite sneezing or cough; there is dullness, fever, and loss of appetite. The thickened slimy mucus which the inflamed membrane, after some days, secretes, accumulates about the eyes and nostrils, and lodging in the bronchial tubes, prevents the free access of air, and the proper purification of the blood. Hence ensue distressed breathing, increasing weakness, and symptoms of nervous disturbance, such as staggering gait, chorea (q.v.), and fits. All dogs are liable to distemper, but the delicate, highly bred, and artificially treated varieties suffer most severely, and amongst them the mortality is very great. Bleeding, physicking, and all irritating and reducing remedies, must be carefully avoided, and a good dry bed in a comfortable airy place provided. The stomach, which is generally overloaded, should be relieved of its contents by an emetic, which, for an ordinary-sized English terrier, may consist of two grains each of tartar emetic and ipecacuanha, with eight or ten grains of common salt, given in a wine-glassful of tepid water. If no effect is produced, the dose must be repeated in twenty minutes. Constipation, if present, should be corrected by half an ounce each of castor and olive oil, to which, in large dogs, a few grains of gray powder is a useful addition. The febrile symptoms, if acute, may be alleviated by giving four times daily, in cold water, two drops of tincture of aconite, and five grains each of niter and extract of belladonna. Distressed breathing will be relieved by applying to the chest and sides, for an hour or two continuously, a thick flannel cloth, wrung at short intervals out of hot water. The throat may also be rubbed with hartshorn and oil, and the nostrils sponged and steamed occasionally. Give frequently, and in small quantities at a time, milk and bread, or any other such simple and digestible food; and when recovery is tardy, and weakness ensues, endeavor by nursing, tonics (q.v.), and stimulants (q.v.) to support the strength.

The term D. is sometimes applied to influenza (q.v.) in horses, and epizootic pleuro-pneumonia (q.v.) in cattle.

DISTICH (Gr. *distichos*, consisting of two rows or ranks) is the classical name given to any two lines, but especially to a hexameter and pentameter, making complete sense. It was much used by the Greeks and Romans as a vehicle for the expression of single thoughts and sentiments; and hence became almost exclusively employed for the classical epigram. The great poets of modern Germany, Goethe, Schiller, etc., have also shown a fondness for the D., and remarkable skill in the use of it. A collection of moral maxims in Latin, ascribed to a certain Cato, Dionysius (q.v.), are called *Disticha*, and were highly popular during the middle ages.

DISTILLA'TION is an important process in the arts. It consists essentially in converting a liquid into vapor in a close vessel, by means of heat, and then conveying the vapor into another cool vessel, where it is condensed again into a liquid. When applied to a solid, the process is called *sublimation*. The object of D. is to separate one substance from others with which it may be mixed. In D. proper, no chemical decomposition takes place; when any of the substances are decomposed, it is called destructive D. (q.v.). The possibility of separating substances by vaporizing them, depends upon the fact that very few substances are volatile at the same temperature. Thus, water boils or becomes rapidly converted into vapor at 212°, alcohol at 173°, sulphuric ether at 94.8, while oil of turpentine must be raised to 318°, and mercury to 662°; and some sub-

stances, again, are altogether *fixed*. By applying the proper degree of heat, then, *and no more*, the more volatile of two substances may be expelled from the less volatile; and supposing the vapors of the two to rise mixed, as they are gradually cooled, that of the less volatile will be condensed before the other, thus affording another opportunity of separation.

It is often, however, not so easy to obtain a perfectly pure product by distillation as might at first appear, owing to another fact in chemistry—namely, that many bodies which, when pure, require a high temperature to vaporize them, become more easily vaporized when mixed with substances more volatile than themselves. Owing to this, it is impossible to obtain, by D. alone, alcohol perfectly free from water. The circumstance, on the other hand, is sometimes turned to good account in another way. By distilling, for instance, parts of plants with water, the essential oils pass over with the steam, and are then separated from the condensed water by other processes.

The applications of D. are numerous both in chemistry and in the practical arts. Pure water is obtained by D., the most of the substances dissolved in natural waters being fixed. Sea-water may thus be rendered drinkable, and there are apparatus for the special purpose. But wherever there are cooking-utensils, a distilling apparatus might be improvised. The pure water that descends from the clouds is produced in a way which is just the process we are speaking of on a large scale. See EVAPORATION. It is no figure of speech to say that the dews are "distilled."

The extraction of zinc from the ore is a distillation; the metal, when reduced, passes over in vapor, and is condensed in a separate vessel. When the zinc ore contains cadmium, this metal, being more volatile, comes over in the first portions, and may be removed. When mercury is used to extract particles of gold from sand, the mercury is distilled off from the amalgam, leaving the gold, which is fixed. The mercury being condensed, is again ready for use.

The most extensive application of distillation is in the manufacture of intoxicating spirits, and in ordinary language this is the most common use of the word. Strictly speaking, indeed, the spirits are not produced by the act of distillation; that is done by the previous step of fermentation (q.v.); and distillation merely separates the spirits from the mixture in which they already exist. But it may be as well to give some account of the whole process under this head.

All the intoxicating drinks used in ancient times seem to have been the products of fermentation merely. The art, as it has been called, of evoking the fiery demon of drunkenness from his attempered state in wine and beer, is a discovery of modern times. It is first mentioned by an Arabian physician of the 11th c., Abulkasem, though the invention is attributed by some to the northern nations. The name *aqua vitæ*, given to distilled spirits by early physicians and alchemists, shows what an estimate they made of the discovery. Raymond Lully "declares this admirable essence to be an emanation of the divinity, an element newly revealed to man, but hid from antiquity, because the human race were then too young to need this beverage, destined to revive the energies of modern decrepitude." Sadly have these anticipations been belied!

Spirits were first distilled from wine, and hence called spirits of wine. An endless variety of substances are now used in this extensive manufacture. Alcohol (q.v.) is the essential ingredient of all spirits, and it results from the decomposition of sugar, which, by the process of fermentation, is resolved into carbonic acid and alcohol. *Sugar*, then, is the direct source of alcohol, and accordingly all vegetable products containing sugar, such as grapes, the sugar-cane, sweet fruits, beet-root, etc., may be used in the manufacture of spirits. But there is another more abundant vegetable substance—namely, *starch*—which is easily convertible into sugar, and thus becomes indirectly a source of alcohol. In malt, and in germinating seeds generally, there is found a substance called *diastase* (q.v.). If a small quantity of this, or of an infusion of malt, be added to a paste of starch, it will in a short time become thin and sweet, the whole of the starch being transformed into sugar. See BEER. It is thus that grain of all kinds, potatoes, and other substances which contain little or no free sugar, are yet capable of yielding alcoholic spirits.

All substances, then, containing either sugar or starch, or both, will yield spirits. With sugar, the manufacture consists of two processes—fermentation and distillation. When starch is the original source, as is more commonly the case in the distilleries of this country, the first step is to convert it into sugar, or to *saccharify* it. This is the object of what is technically called *mashing*, which consists in mixing the materials in a triturated state with water at the temperature of about 160°. It is mostly from barley, oats, and rye that spirits are manufactured; wheat is less used, owing to its cost. Raw grain is ground to meal; malt is only bruised. A certain proportion of malt is always used, even in distilling from raw grain or potatoes, as the diastase of the malt is necessary to set agoing the saccharine fermentation. After being agitated for two or three hours, the saccharine infusion, called *wort*, is drawn off from the grains, and cooled. To this wort is now added a certain quantity of yeast or barm, which induces the vinous fermentation, and resolves the saccharine matter into alcohol and carbonic acid, accompanied by a rise of temperature. The alcoholic mixture which results is called the *wash*, and is now ready for distillation. This takes place in an apparatus called a still, or alembic (q.v.). In its older and simpler form, the still consists of a copper vessel, into

which the wash is put. This vessel is provided with a close head, terminating in a bent tube, which passes, in a spiral form (the worm), through the refrigeratory, filled with cold water. See STILL. When heat is applied to the still, the spirit begins to rise in vapor at 176°, along with more or less steam; these vapors pass through the worm, become condensed by the cold, and drop or trickle in the form of liquid into a receiver. The product of this first distillation in a simple still is called *low wines*. This is then redistilled at a lower temperature, in order to deprive it of part of the water and of the fetid oils that had passed over with the alcohol. To obtain great purity and strength, repeated distillation is used.

A great improvement in distilling was invented in 1801 by a workman of Montpellier, of the name of Adam. By making the vapors arising from the still pass through a series of winding passages, maintained at a determinate degree of heat, and deposit part of their water and other impurities, he was able to obtain from wine a spirit of any required cleanness and strength *at one operation*. This principle has been adapted, by Pistorius of Berlin (1817), to the distillation of the coarser washes of grain and other materials.

Absolute or anhydrous alcohol (q.v.) cannot be obtained by distillation alone. Rectified spirit, or spirit of wine, for burning in a lamp, still contains, when of ordinary strength, about 25 per cent of water. Alcohol is considerably lighter than water, its specific gravity being 793 (water, 1000). The stronger any spirit is, then, the less will be its specific gravity; and thus the strength of spirits may be ascertained by an instrument which measures their specific gravity, the *aèrometer* (q.v.) or *hydrometer*. The excise of Great Britain has established one degree of strength as the legal standard, and this is called *proof*. The specific gravity of proof-spirit is 918.6, and it contains nearly equal weights of water and alcohol.

If only alcohol and water passed over in distillation, all spirits, from whatever extracted, would be the same; but this is not the case. Brandy, which is distilled from wine, has a peculiar essential oil derived from the grape, and also some acid; rum is impregnated with an essential oil from the sugar-cane, and with other impurities; malt liquor has the essential oil of barley, etc. It is these essential oils that give to the various spirits their distinguishing flavors. Some of the oils and other impurities are disagreeable and positively noxious; and it is the objects of *rectifying* to remove these. The mellowing effect of age upon spirits is owing to the evaporation or spontaneous decomposition of the essential oils. Newly distilled spirits are in general fiery, and specially unwholesome.

Sugar, when fermented, resolves itself into nearly equal weights of carbonic acid and alcohol; a pound of sugar, therefore, should yield upwards of half a pound of proof-spirit. The quantity of spirit afforded by different grains depends upon the proportion of starch they contain: 100 pounds of starch is calculated to yield 35 pounds of alcohol, equal to nearly 8 gallons of proof-spirits. Of the various grains, wheat is the most productive. Taking the average of wheat, barley, rye, oats, and maize, 100 pounds of corn yield 40 pounds of spirit of specific gravity 942 = 3.47 gallons proof. A distiller of malt whisky, says Dr. Ure, calculates on obtaining two gallons of proof-spirits from one bushel of malt in ordinary years. The highest yield is 20 gallons per quarter of 8 bushels.

The principal intoxicating beverages produced by distillation are. 1. Brandy (q.v.), which name is applied properly only to spirits distilled from wine. 2. Rum is manufactured from molasses and other uncrystallizable products of the sugar-cane. 3. Corn or malt spirit, under the various names of British spirits, gin, whisky, etc. The Dutch distillers give a peculiar flavor to their spirits (Hollands) by adding a portion of juniper-berries to the other ingredients. From the French name of the juniper, *genièvre*, come *geneva* and *gin*. 4. Spirits from various vegetable substances. In Germany, a great quantity of spirit is distilled from potatoes, which contain about five per cent of starch. Beet-root and carrots are also used in the same way. The Swedes make a kind of spirit from the sap of the birch, and the maple and other trees are turned to a similar account. We have, besides, cherry-brandy, peach-brandy, cider-spirit, etc. 5. Arrack (q v.) is the East Indian name for all ardent spirits. See SPIRITS.

DISTILLATION, DESTRUCTIVE, is the term applied to the process of heating vegetable and animal substances in retorts or similarly closed vessels, at a temperature sufficient to decompose the original substance, and obtain therefrom products possessing different properties from the material which yielded them. Examples of this process are, the heating of coal in gas-works at a red heat, when it resolves itself into coke, which is left in the retort, and coal-gas, naphtha, tar, etc., which distill over into suitable receivers; the treatment of coal at and below a low red heat, when it yields much paraffine oil; the distillation of wood in close vessels, at a red heat, when charcoal is left in the vessel, and wood-vinegar, wood-spirit, tar, etc., pass over in vapor, and are condensed; and the heating of bones in similar retorts, when animal charcoal is left in the retort, and Dippel's animal oil distils over.

DISTILLED WATER is the condensed product obtained by the distillation of water. All natural waters, even rain-water, contain certain saline matters (common salt, etc.) in a state of solution, from which they can only be completely freed by the process of distillation. The characters of distilled waters are, that it possesses a mawkish, insipid

taste, without odor or color, and when evaporated to dryness in a vessel, it ought to leave no residue. The other properties of distilled water will be noticed under WATER.

DISTILLED WATERS are obtained by distilling water along with the parts of plants containing essential oils. Rose-water and lavender-water are familiar examples.

DISTORTION. The rules of perspective impose certain conditions in the delineation of natural objects, and when the image formed by a lens on the focusing screen of a camera obscura does not fulfill those conditions, it is said to be distorted. The effect of distortion is to render all straight lines, which do not pass through the center of the lens, curvilinear, and also so to alter the relative proportions of objects in the picture as to be opposed to the principles of true perspective. Distortion, in the camera obscura, is generally produced by the eccentrical incidence of the oblique pencils.

DISTREIN. See DISTRESS.

DISTRESS, in English law, is the common-law remedy by which a man may remunerate himself for non-payment of rent or other duties, or may impound another's cattle trespassing upon his land. Distress is defined to be "the taking of a peronal chattel out of the possession of the wrong-doer into the custody of the party injured, to procure a satisfaction for the wrong committed."—Stephen's *Com.* iii. 342. Distress is a remedy of the feudal law. It was an incident quite inseparable from the fealty to the lord; so that, as lord Coke lays down, a lord granting the rent to another, and retaining the fealty, the grantee of the rent could not distrein.—*Co. Litt.* 150 *a.* Distress was incident to every service; hence it might be put in force for failure to do suit in the lord's court, or for not payment of the duties awarded in a court leet. In modern days, distress is practically enforced chiefly for non-payment of rent, for non-payment of certain public rates, and upon cattle straying upon land not belonging to their master. Cattle so straying may be impounded and retained as security till their owner makes satisfaction. Distress for public rates is allowed by the statutes imposing the rates. In this species of distress, and distress for non-payment of rent, the articles are not merely kept as security, but may be sold to pay the amount due. Whatever goods the landlord finds on the premises, even goods belonging to a stranger, may be distreined; but animals *feræ naturæ,* and goods delivered to the tenant by way of trade, may not be taken. A landlord may, by special statute, 11 Geo. II. c. 19, distrein goods fraudulently carried off the premises; and by the same statute he may, with the assistance of the peace-officer of the parish, break open doors to obtain the goods so removed.—See Stephen's *Com.* iii. 341–50.

DISTRIBUTION OF LIFE, ANIMAL AND VEGETABLE. In the light of modern discoveries, the interdependence of every part of nature is clearly revealed, and the life of the world is seen to be one symmetrical organism, the different parts of which are distributed in time and in space by the operation of laws as yet but imperfectly understood. Animals and plants, though sustaining very close relations to each other, form two distinct branches of study, whose phenomena require to be carefully discriminated. Animals are divided into terrestrial and aquatic, the first class being the most important and best understood. Their distribution is considered in two aspects—the climatical and the geographical—which present distinct and sometimes conflicting classes of facts. Of the two, the geographical conditions are the most important. The range of animals is determined in some degree by the altitude or depression of the land-surface on which they dwell. A very important element to be considered, in determining the causes of the distribution of animals, is found in their different powers of dispersal or migration, some having no means of passing over seas, or lofty mountains, or arid deserts, while others, especially the insect tribes, are not thus limited. But migrating animals can not always maintain themselves in a new region, the organisms in previous possession of the soil being too strong for them. The power of adaptation is generally inferior to the power of dispersion. The nature of the vegetation determines the range of some animals. Deserts, marshes, and forests have each their peculiar inhabitants, which do not often stray beyond their limits. Tropical forests especially supply the wants of a great number of peculiar form of life. Mountains of great height and in unbroken ranges form a barrier to the migration of many groups, but their geological age is limited, while oceans, owing to their great antiquity, have separated the faunas of different continents for countless ages. The zoological regions of the earth, according to the best authority, are six in number, each one having marked and distinct peculiarities. The last of these divisions is the Nearctic, which comprises all temperate North America, and is subdivided into the Californian, the Rocky mountain, the Alleghany, and the Canadian regions. The peculiar fauna of the Nearctic region is best represented in the United States, where many peculiar genera of mammalia, birds, reptiles, and insects are found. The distribution of the higher animals during the post-tertiary and tertairy periods is a subject of very deep interest. It is found that, during the post-tertiary period, the reindeer and the antelope inhabited France; elephants and rhinoceroses roamed all over Europe; in North America there were lions, horses, camels, bisons, elephants, and mastodons. This period was characterized by great movements or migrations of the higher animals, and by the extinction of many huge creatures belonging to almost every order of mammalia, and several orders of birds. The tertiary fauna of North America, compared with that of Europe, exhibits proof of a former communication between the two northern conti-

nents. From the knowledge now possessed of the extinct fauna of most of the great continents, scientists can approximately determine the original birthplace of some now widely distributed groups. The distribution of the marine animals also presents many interesting phenomena, but they cannot be noticed here. The geological record on which depends our knowledge of the distribution of animals in respect to time, though it reveals much important truth, is yet very imperfect. The evidence, so far as it goes, tends, it is thought, to confirm the doctrine of evolution.

The distribution of vegetable life is involved in much obscurity. For a long time the investigation of the subject was pursued under great disadvantages, and with very unsatisfactory results. The writings of Darwin, Hooker, Gray, and Bentham, however, have thrown much light on the subject. Bentham recognizes three ancient floras—the northern, the tropical, and the southern. The northern is divided into that of the old and new world by the severance of North America from Northern Asia, and by the barriers of the Rocky mountains. The divergences in the flora of these two regions originated in distance, but have been greatly increased by isolation. Lesquereux believes that the origin of the present American flora is American. There is a strong analogy, however, between it and the miocene flora of Central Europe, and the American element in the latter is supposed to be derivative, confirming the observation of Gray that plants tend to migrate from east to west, rather than from west to east. The boundaries of the northern flora, under the influence of climatic variations, have also undergone longitudinal changes. The northern flora, by the combined influence of physical and genetic causes, has undergone a specialization into three distinct groups—the Arctic-Alpine, the temperate, and the Mediterraneo-Caucasian. The southern flora is still more complex in its relations, and is described in five types—the Antarctic-alpine, the Australian, the Andine, the Mexico-Californian, and the South African; the latter, though limited in extent, being the richest of all. The tropical flora has hardly as yet been investigated. It presents three subdivisions—the Indo-Malayan, the American, and African; the latter, especially, being very imperfectly known. This whole branch of science is, in many respects, an unexplored field and a very inviting one to naturalists. See GEOGRAPHICAL DISTRIBUTION OF ANIMALS, AND GEOGRAPHICAL DISTRIBUTION OF PLANTS, *ante*.

DISTRIBUTIONS, STATUTE OF, the statute 22 and 23 Car. II. c. 10, explained by 29 Car. II. c. 3. This statute regulates the division of the estate, according to the law of England, of a person dying intestate. A widow is by this act entitled to one third of the estate in case there are children, the remainder being divided between the children in equal portions. If there be no children, the widow has half, and the other half is divided among the nearest of kin, or their representatives. If no widow, the children take all. If neither widow nor children, the estate is divided amongst the next of kin. In this case, the father (or, if he be dead, the mother) excludes brothers and sisters of the deceased; but by 1 Jac. II. c. 17, the mother of an intestate must take equally with the brothers and sisters of the deceased.

DISTRIBUTION OF SPECIES. See SPECIES.

DISTRICT ATTORNEY OF THE UNITED STATES, a member of the bar appointed to try civil and criminal suits for the government in the circuit and district courts of the United States, and required by law to report his doings to the attorney-general in Washington. He has a merely nominal salary, but receives fees, often large, prescribed by act of congress. The office is one of responsibility and honor.

DISTRICT, CONGRESSIONAL, that portion of the territory of a state the voters in which are by law entitled to choose once in two years a representative to the congress of the United States. The number of such districts varies from time to time, being fixed by congress immediately after each decennial census. (See APPORTIONMENT BILLS.) The boundaries of the district in each state are determined by the legislature thereof. The ratio of representation (number of inhabitants required for a district) under the census of 1870 is 131,425; the number of districts is 293. The ratio is raised after each census, on account of increase of population, as otherwise congress would be inconveniently large. The time may come when a member of congress will represent a million of people. The constitution declares that each state shall have at least one representative, even if its whole population should at any time come short of the prescribed ratio. Under this rule the state of Delaware with a population of only 125,015 has one representative in the lower house of congress, while in the senate its representation is equal to that of any other state. It is probable that the population of some other small states will ere long fall below the decennial ratio of representation.

DISTRICT OF COLUMBIA (COLUMBIA, *ante*), a small territory between Maryland and Virginia selected in 1800 as the site for the national capital of the United States. The selection of a place for the seat of government provoked the first discussion of a sectional nature after the adoption of the federal constitution. The government was organized at New York, Mar. 4, 1789, and congress met in that city until 1791. In 1790, after a long discussion, a bill was passed providing that the seat of government should be changed to Philadelphia, where it should remain from Dec., 1790, to Dec., 1800, at which time it should be upon "a district of territory not exceeding 10 sq. m., on the

river Potomac, between the mouth of the eastern branch and Conogocheague." The land was on both sides of the Potomac, and was ceded by the owning states with the condition that congress, or the United States, should have exclusive control forever. Maryland ceded 64 sq.m., or the whole of Washington co.; and Virginia ceded 36 sq.m., which was Alexandria co.; but in 1846, the Virginia portion was returned to that state, as no part of the government establishment had been erected s. of the river. It is said that the site of Washington, or near there, was a favorite meeting-place for Indians. Among the earliest white settlers was an Englishman named Pope, who bought land and named the stream flowing through it the Tiber, and to the eminence on which the United States capitol now stands, he gave the name of Capitoline hill, calling his whole plantation Rome, and signing himself "Pope of Rome." About 60 years before the revolution, one of the ancestors of Daniel Boone owned the land now occupied by the city of Georgetown, on which he laid out a town of the same name. The first movement towards selecting a permanent seat of government was in 1783, when, through acts of mob violence, congress was forced to adjourn from Philadelphia to Princeton, New Jersey. At that time Elbridge Gerry of Massachusetts offered a resolution (adopted, but afterwards repealed) providing for the selection of a site on the Delaware, and one near the falls of the Potomac, his idea being to have a northern and southern capital. The authority to select a site was given, finally, in the federal constitution. The government title to the territory was perfected, and buildings suitable for the accommodation of congress and the executive departments were ready at the prescribed time, and on the first Monday of Dec., 1800, the capital was fixed in the federal city called Washington. For many years afterwards, Washington was but the skeleton of a town, and from its ambitious proportions was nicknamed "the city of magnificent distances," while even the poets flouted its pretension with the line, "And what was Goose creek once is Tiber now." In 1814, the British took possession of the territory, and burned the capitol and other public buildings. Soon after that war, the District of Columbia began to improve in population and industries. When the rebellion began, strong fortifications were erected for the defense of Washington, which was several times menaced or in danger, but never actually attacked.

The district of Columbia was governed directly by congress until 1871, when the people of the district were given the privileges of self-government as a regular territory; but thus far they have sent no delegate to congress. As in other territories, the voters have no voice in presidential elections; and it is a singular fact that until the act of 1871 many of the people residing in this district in sight of the capitol were not political citizens of any state nor of the nation. The territorial act creates a governor and secretary, appointed by the president and United States senate; a council of 11, and a house of delegates of 22 members, with annual sessions limited to 60 days. Pay of governor, $3,000 a year: legislators, $4 per day. Suffrage is the same as in nearly all the states.

At the commencement of 1879, there were in the district 6 daily and 14 weekly newspapers, and 5 monthly and 1 quarterly publication—26 in all. Children between 6 and 17 are within school age, and in 1878, there were 38,850 in the district; 24,000 enrolled; average attendance, 16,318; school days, 195; teachers, 40; income for education, $385,000; expenses, $270,000; school property valued at $1,169,614. The colleges are: Columbia university (Bapt.); Gonzaga college (R. C.); National deaf-mute college (non-sect.); and Howard university (non-sect., though under Cong. and Pres. patronage); all at Washington; and Georgetown (R. C.) college. In all these there were 41 instructors and 268 pupils. Both sexes are admitted to Howard university, and colored students are admitted to the theological department. The Baptists have also a school (Wayland seminary) in Washington; there are medical departments in nearly all the colleges, and also a National college of pharmacy. All except the Roman Catholic institutions have law departments, in which there were 12 instructors and 342 students; in medicine, 42 instructors and 183 students. (For latest statistics, see Appendix).

DISTRICT COURTS OF THE UNITED STATES, tribunals subordinate to the circuit courts. Each of the nine judicial circuits (corresponding to the number of justices of the supreme court) is divided into a larger or smaller number of districts. In some instances a district embraces the whole territory of a state; in others, states are divided into two or more districts. In one instance a single judge serves three, in others, two districts. With these exceptions, there is one judge for each district. When a circuit court is held within the limits of a judicial district, the district judge sits with the judge of the supreme court appointed for that circuit.

DISTRICT, SENATORIAL. A territory, the electors of which are entitled to choose a representative in the upper branch of a state legislature. The U. S. senators are chosen by the state legislatures, two for each state, without reference to population; hence the term district is in no way applicable to them.

DISTRICTS, MILITARY, are certain regions into which the United Kingdom is divided for military purposes, to facilitate command and organization. Before Mr. Cardwell's act of 1872, England was divided into four districts, and Ireland into five, while Scotland formed one. Now there are nine general districts in England—namely, the northern, with Manchester as its headquarters; the eastern, with Colchester; the southern, Portsmouth; the south-eastern, Dover; the home district, London; the Chatham; the

Woolwich; the Aldershot. In Ireland there are four—Belfast, Dublin, Cork, and the Curragh. Scotland is still one district, with Edinburgh as head-quarters. Jersey is a military district; and Guernsey and Alderney form another.

DISVELLOPED, or DEVELOPED, is applied to the colors of a regiment or army, which are said, heraldically, to be disvelloped when flying.

DITCH, in agriculture, is a trench usually made along the sides of fields, so that all the drains may be led into it. A hedge is often planted along the side, and the two form a better fence for cattle. In cold, undrained lands, the earth thrown out of the trench forms a mound of dry earth, which is particularly serviceable for the growth of thorn-hedges. Accordingly, this is the common mode adopted in planting hedges in such districts, where the subsoil is often close, tenacious, and not well suited for their growth. Various forms of ditches are made; sometimes a double D. is adopted, and the hedge planted between. In arable lands, however, since the general use of small and large pipes, ditches have been converted into underground drains, which has effected a great saving of land, as well as giving to the fields a tidy appearance.

DITCH is one of the most important of the defense-works of a fortified place. It is a broad and deep trench, that may either be kept dry or filled with water; in practice, it is generally dry.

In permanent works, such as the regular fortifications of a town, the *rampart* and the *ditch* are the most important; the former being inside the latter, and formed mainly of the earth excavated from it. The D. is often 120 ft. wide, 12 ft. deep below the natural level of the ground, and 24 ft. beneath the parapet of the rampart. See COVERT WAY.

DITHYRAM'BUS, originally a surname of Bacchus, of uncertain derivation and meaning, was subsequently applied to a species of lyric poetry cultivated more particularly at Athens, and characterized by loftiness and vehemence of style, which, however, at a later period, degenerated into bombast and extravagance. The D. was originally a passionate hymn, sung by one or more revelers to the music of a flute; but Arion (q.v.) invented for it a regular choral or antistrophic form. It is this form which is generally spoken of as the dithyramb. It subsequently received various alterations, but no specimens of it have survived.

DITMARSH, NORTH and SOUTH (*Norder* and *Süder Dithmarschen*), the name given to the western district of the German duchy of Holstein, lying between the Eider and the Elbe. The entire area is 500 sq. miles. Pop. 75,000. In old German times, D. formed a part of Saxony beyond the Elbe, and is worthy of special notice, because the inhabitants have preserved to the present day the peculiarities of antiquity. It has its own collection of laws, known as the *Ditmarsh Land-book*, which originated in 1321 from 48 judges; was altered in 1447, first printed in 1497, amended in 1567, and finally enjoined anew in 1711. Whatever authentic notices, traditional and otherwise, we possess of D., we owe to Joh. Adolfi (b. 1559, d. 1629), whose *Chronik des Landes D.* (Ditmarsh Chronicle), written in the Lower Saxon dialect, was published in the original text, with 23 dissertations by Dahlmann (Kiel, 1827).

DITTANY, *Dictamnus*, a genus of plants of the natural order *rutaceæ*, having a short 5-partite calyx, 5 somewhat unequal petals, 10 stamens, and 5 1 to 3-seeded follicular capsules cohering at the base. The COMMON D., also called BASTARD D., or FRAXINELLA (*D. albus*), a native of sunny mountains and rocks and dry mountain-forests of the s. of Europe, especially in calcareous soils, is very generally cultivated as a garden-flower. It is a perennial, with stem 1½ to 3 ft. high, perfectly unbranched, bearing a few pinnated leaves, which have 3 to 5 pair of leaflets and an odd one, and terminating in a beautiful erect raceme of 10 to 20 flowers. The flowers are of a fine rose color, with darker veins, more rarely white. The plant diffuses a powerful fragrance from its numerous oil-glands when in flower, and during dry, hot weather exhales such a quantity of volatile oil that its sudden combustion makes a slight flash when a candle is brought near it on a warm summer evening. The root is thick, white, and very bitter, and was formerly in high repute in medicine as a tonic stimulant, but is now neglected.—D. of Crete, used as a febrifuge, is a very different plant (*Origanum dictamnus*), a kind of marjoram (q.v.).

DIT'TAY, a technical term in the criminal law of Scotland, now little used, signifying the ground of indictment or substance of the charge. By *taking up dittay* was understood the collecting of information in order to trial, which is now effected by what is called a precognition.

DITTEE'AH, or DUTTEEAH, a t. in Hindustan, 125 m. s.e. of Agra; pop. about 50,000. It is a walled town, and the capital of a rajahship.

DITTON, HUMPHREY, 1675–1715; an eminent English mathematician, for some years a dissenting clergyman. The influence of sir Isaac Newton secured for him a professorship in the new mathematical school at Christ's hospital, where he remained through life. He and Whiston published a new method for determining longitude at sea, but it was rejected by the board of admiralty. Ditton was the author of several mathematical works.

DĬU', a seaport, situated at the eastern extremity of an island of the same name off the s. coast of Guzerat, in Hindustan; is well fortified, having a tolerably safe harbor, with a general depth of three or four fathoms. The anchorage, however, is said to be gradually becoming shallower. Pop. of town about 11,000. The place has been in possession of the Portuguese ever since 1515; but, from its detached and isolated position, its trade is of little consequence.

DIURET'ICS, medicines having the property of increasing the secretion or excretion of urine, and on this account much employed in dropsies, as well as in a variety of other diseases. The principal diuretics are the salts of potash, especially the nitrate, acetate, and bitartrate (cream of tartar); squill in powder, vinegar, or sirup; digitalis or foxglove, in powder or infusion; the decoction or infusion of broom-tops (*scoparium*): the decoction of the American winter-green or pyrola; the alcohols and ethers, with most of the volatile oils, especially that of juniper, as in gin; the berries of the common elder; the tincture of cantharides or Spanish flies; turpentine, etc. The last named (from the alcohols onwards in the above enumeration) are more or less irritating in their effects on the urinary organs, and should not be used without due consideration as to the requirements of the particular case. Cream of tartar and the broom-decoction form one of the safest and best diuretic mixtures which can be employed for domestic purposes; or cream of tartar may be given alone, either dissolved in hot water, and allowed to cool, or in substance along with sirup.

DIVAN' is a Persian word, having various significations. It is used in the sense of a muster-roll, a register of payments or account; it is also applied to a collection of poems or songs by one and the same author. Goethe uses it in this sense in his *Westöstliche Divan.* Divan means next an administrative board; the highest council of state at Constantinople is called *Diváni humájún,* most illustrious divan. Finally, divan is the name for the state or reception room in palaces and the private houses of the richest citizens. Along the walls of the room are ranged low sofas, covered with rich carpets, and provided with many cushions. Hence the name divan has been transferred in the w. of Europe to a kind of sofa.

DIVEL ON THE NECK, an instrument of torture used against the Lollards. It is thus described by FOX, in his *Acts and Monuments:* "Certain strait irons called the divel on his neck being after an horrible sort devised, straitening and winching the neck of a man with his legs together, in such sort as the more he stirreth in it, the straiter it presseth him, so that within three or four hours, it breaketh and crusheth a man's back and body in pieces."—Cowel's *Interpreter.*

DIVER, or LOON, *Colymbus,* a genus of birds of the family *colymbidæ* (q.v.), having a strong, straight, rather compressed pointed bill, about as long as the head; a short and rounded tail; short wings, thin compressed legs placed very far back, and the toes completely webbed. They fly well, but are particularly expert in diving. They prey upon fish, which they pursue under water, making as much use of their wings as of their legs and webbed feet in their subaqueous progression. They are scarcely capable, however, of walking on land, and the name *loon* is supposed to refer to this incapacity, and to be from the same root with *lame.* The GREAT NORTHERN D., or LOON, also called the IMMER or EMBER GOOSE (*C. glacialis*), is a bird about 2½ ft. long, exhibiting no little beauty of plumage; the upper parts black, spotted with white; the head black, with tints of green and blue; the belly white. It is a winter visitant of the British coasts, even to the furthest s., and is occasionally seen in inland districts; is found in like manner in most parts of Europe, the n. of Asia, and North America, as far s. as Texas, but it breeds chiefly in the more northern regions, as Labrador, Iceland, and Spitzbergen. It is not exclusively marine, being often seen on large rivers, and making its nest on the shores of fresh-water lakes. Its cry is very peculiar and wild, has been likened to the howl of a wolf, and is in some countries superstitiously regarded as ominous of evil. It is easily tamed, and becomes very familiar. The BLACK-THROATED D. (*C. Arcticus*) is another northern bird, of similarly wide geographic distribution, but much smaller size, being only about 26 in. in length. It is found at intervals distributed round the coasts of Britain, and it occasionally breeds in the fresh-water lochs of the n. of Scotland. The RED-THROATED D. (*C. septentrionalis*) is also found in all the northern parts of the world, is more common in Britain than either of the other species, and is the bird generally called loon on the British coasts. In size it scarcely equals the black-throated diver. Its back is brownish-black, the belly white, the throat red. The flesh of all the divers is dark, tough, and unpalatable.—The name D. is sometimes extended to all the *colymbidæ* (q.v.), sometimes to all the *brachypterœ* (q.v.).

DIVERGENT. See CONVERGENT.

DIVERTIMENTO, or DIVERTISSEMENT, a species of musical composition consisting of different movements, arranged in an easy style for one or more instruments, but not so elaborately wrought out as the sonata, or other more regular compositions. The D. has generally no fixed character, being merely a musical picture without any attempt at artistic effect, or other aim than to please the ear, and may be said to take its place between the *etude* and the *capriccioso.* The D. was greatly in vogue during the last half of the 18th c.; until then, the word had never been used to denote a musical composi-

tion. In France, D. is the name given to certain dances and songs introduced between the acts of an opera, or play, for the amusement of the public during the pause, and as such it was used there much earlier than in Italy or Germany.

DIVIDEND, the sum apportioned to creditors from the realized assets of a bankrupt estate, and which is at the rate of so much per pound of the claims. The half-yearly interest on the public funds, and periodical profits on shares in joint-stock undertakings, are also called the dividends, the latter being usually declared half-yearly, by order of the directors. Occasionally the dividends do not exhaust the profits, and the surplus is allowed to accumulate, until it is paid to the shareholders as an extra D. called a bonus.

DIVIDING ENGINE. See GRADUATION.

DIVIDIVI, or LIBIDIBI, the curved pods of *cæsalpinia coriaria* (see CÆSALPINIA), a tree which grows on the coasts of Curaçoa, Carthagena, and other parts of tropical America. They have been long used there for tanning, but have recently acquired importance as an article of commerce. A considerable quantity is now annually brought to Britain. D. is one of the most astringent substances known.

DIVINATION (Lat. *divinatio*) is the act of discovering the hidden, but more particularly the future, in a supernatural way. Men have at all times set their imaginations above the causes of nature, and by a curious subjective process, have endeavored to draw out of themselves what could in reality be only derived from a study of the laws of nature. Thus, there have been instituted systems of superstition among almost all nations of the world at one period of their history, which the march of scientific discovery and the beneficent influences of a rational religion have failed to wholly eradicate, so that, even among comparatively enlightened peoples, there lurks a deep substratum of this old-world feeling. A more special use of the term is to denote fortune-telling or sorcery (middle-age Latin *sortiarius*, one who reads the future by means of lots or *sortes*). It was a maxim with the nations of antiquity, that if there are gods, they care for men; and if they care for men, they will send them signs of their will. This, with some variations, has been a universal sentiment in all ages and countries. But it was the first step in this journey which presented the whole difficulty. How was man to know the will of the gods? The variety of answers which this question has drawn forth constitutes the history of divination. Thus, among the Greeks, the word for D. was *mantikē*, which signified more than the Latin *divinatio;* inasmuch as it was applied to any means by which the Deity discloses himself to man, while the Latin word denoted more the power which man is supposed to possess of discovering the future. With the Greeks, the seer was passive; with the Romans, he was active. See SEER and ORACLE. Astrology was a favorite method of D. among the ancient Chaldeans, as well as in the middle ages. *Auguries* and *auspices*—both words derived from *avis*, a bird—were systems brought to perfection by the Romans as means of knowing the will of the gods. See AUGURIES and AUSPICES. The sacrifice of beasts, besides, the casting of the horoscope, and the observing of the constellations, were all favorite modes of guessing at the future practiced by the Romans. But the belief was not confined to the old world. The Araucanians, a warlike nation of South America, seem to have placed as implicit faith in the D. of birds as did the Romans, and they practiced this art in a way not very dissimilar. Even among ourselves, the merry-thought bone of fowls is known to possess a curious virtue, and boys need not be told the omens connected with the magpie.

An extensive set of omens have been taken from observing what first happens to one, or what animal or person one meets first in the morning, or at the commencement of an undertaking—the *first-foot*, as it is called. To stumble, has been universally held to presage misfortune. Some semblance of a reason might be found for this belief, inasmuch as stumbling may be supposed to indicate that that self-possession and conscious courage, which are in themselves half a victory over circumstances, are lacking—the want of them, therefore, being half a defeat; but in most cases the interpretation seems altogether arbitrary. The dread of a hare crossing the path seems to be widely prevalent; while to see a wolf is a good omen. This feeling is probably a remnant of warlike times, when the timid hare suggested thoughts of cowardice and flight; while the bold wolf, sacred to Odin, was emblematic of victory. The character of the hare for being unlucky is also connected with the deep-rooted belief, that witches are in the habit of transforming themselves into hares. That to meet an old woman is unlucky, is another very general belief; arising, without doubt, from the same causes that lead to their being considered witches. In some places, women in general are unlucky as first-foot, with the singular exception of women of bad reputation. This belief prevailed as far back as the age of Chrysostom. Priests, too, are ominous of evil. If hunters of old met a priest or friar, they coupled up their hounds, and went home in despair of any further sport that day. This superstition seems to have died out, except in the case of sailors, who still consider the clergy a "kittle cargo," as a Scotch skipper expressed it, and anticipate a storm or mischance when they have a black-coat on board. This seems as old as the days of the prophet Jonah.

The observation of *lucky* and *unlucky* days was once an important matter, and was often the turning-point of great events. It is now confined to the one subject of mar-

riage. In fixing the wedding-day, May among months, and Friday among days, are shunned by many people both in the higher and lower orders; for in this matter, which is the exclusive province of women, and in which sentiment and fancy are in every way so much more active than reason, the educated and uneducated are reduced to a level. Perhaps half the superstitious beliefs that yet survive among civilized and Christian communities, group themselves round the subject of love and marriage—of such intense interest to all, yet so mysterious in its origin, and problematical in its issue. The liking or passion for one individual rather than any other, is so unaccountable, that the god of love has been fabled blind; it is of the nature of fascination, magic, spell. And then, whether happiness or the reverse shall be the result, seems beyond the reach of ordinary calculation. All is apparently given over to mystery, chance, fortune, and any circumstances may, for what we know, influence or indicate what fortune's wheel shall bring round. Hence the innumerable ways of prognosticating which of two or more persons shall be first married, who or what manner of person shall be the future husband or wife, the number of children, etc. It is generally at particular seasons, as at the eve of St. Agnes and Hallowe'en, that the veil of the future may thus be lifted.

Sneezing, likewise, has long been looked upon as supernatural, for this reason, that it is sudden, unaccountable, uncontrollable, and therefore ominous. The person is considered as possessed for the time, and a form of exorcism is used. A nurse would not think she had done her duty if, when her charge sneezes, she did not say: "Bless the child," just as the Greeks, more than two thousand years ago, said: "Zeus protect thee."

One general remark, however, it is important to make in regard to omens. An *omen* is not conceived to be a mere sign of what is destined to be; it is conceived as causing in some mysterious way the event it forebodes; and the consequence, it is thought, may be prevented by some counteracting charm. Thus the spilling of salt not only forebodes strife, but strife is conceived as the consequence of the spilling of the salt, and may be hindered by taking up the spilled salt and throwing it over the left shoulder.

An important exercise of the diviner's art is to determine the innocence or guilt of parties. This will be treated under ORDEAL. But it would be impossible to enumerate the endless modes of D. for which learned names have been found. Some of the principal are *axinomancy* (q.v.), *belomancy* (q.v.), *bibliomancy* (q.v.), *botanomancy*, or D. by means of plants and flowers (it was practiced by the ancients, who were wont to bruise poppy-flowers betwixt their hands, under the conviction that they could thereby discover their loves. Hence Theocritus calls the poppy *teliphilos*, quasi *deliphilos*; i.e., a *tell-love*. Goethe has made a beautiful use of another form of this superstition, which existed among the Teutonic races no less than among the old Greeks. The child-like Marguerite, in *Faust*, seeks to discover whether or not Faust loves her by plucking the leaves from a star-flower, murmuring alternately, "He loves me," "He loves me not," and finds to her joy that the *last* leaf comes away while she is saying "He loves me"); *capnomancy* (q.v.), *cheiromancy* (q.v.), *cosinomancy* (q.v.), *crystallomancy* (q.v.), *cup, divination by* (q.v.); *geomancy* (this was anciently practiced by casting pebbles on the ground, from which conjectures were formed; but the Arabian geomancy was more recondite, being founded on the effects of motion under the crust of the earth, the chinks thus produced, and the noises or thundering heard); *hydromancy*, D. by water or by a mirror, in which the diviner shows the image of an absent person, what he is doing, etc. (this mode of D. plays an important part in the Arabian romances); *lithomancy*, a species of D. performed by stones, but in what manner it is difficult to ascertain; *oneiromancy* (see DREAMS); *pyromancy*, or D. by flame (it was common among the Greeks and Romans: if the flame of the sacrifice was vigorous and quickly consumed the victim, if it was clear of all smoke, and did not crackle, but burn silently in a pyramidal form, the omen was favorable; otherwise, it was not); *rabdomancy* (see DIVINING-ROD); and *teraphim* (q.v.).

DIVINE RIGHT. A term applied to describe the source of the power claimed for the monarch, by the royalist party, in the great controversies between the monarchical and the parliamentary or commonwealth parties in England in the 17th century. The monarch was held to be the immediate representative of the Deity, to whom alone he was responsible for all his actions—a principle which, of course, relieved him from all human responsibility. The idea was little known in this country until the quiet transfer of the crown from the Tudor to the Stewart dynasty showed that the hereditary principle was firmly established. It was found by some ecclesiastics in the doctrine of the civil law, which, in imitation of the practice of oriental nations, flattered the Roman emperors by attributing to them a power founded on divine institutions. Throughout a long and miserable contention, D. R. was on the one side maintained to be the source of political power, while on the other it was maintained that that power emanated from the will of the people, expressed in what was called "the social contract." The chief writers on the side of D. R. were Salmasius and sir Robert Filmer; on the other, Milton, Algernon Sydney, and Harrington. The controversy revived in the discussions which caused the French revolution, long after the settlement of the crown on William and Mary and the Hanover dynasty had settled it in Britain.

DIVINE SERVICE, a tenure by which the tenant was bound to do some special divine service, as to sing so many masses, to distribute a certain sum in alms, or the like. It differed from frankalmoigne (q.v.) in this, that the lord could distrain for the former, not for the latter, which, being an indefinite service, could be enforced only by a complaint to the ordinary or visitor.

DIVING. The "treasures of the deep" have at all times been the subject of much visionary exaggeration, and the accounts of the exploits of divers equally extravagant. We could name a popular school-book, still in extensive use, where children are seriously informed that the pearl-divers of the east acquire by practice the power of remaining under water from 15 to 20 minutes. Such statements are common enough in narratives of ancient date, in some of which the time is extended to two hours. It need scarcely be said that these accounts are absurd, no such endurance being possible. The more skillful divers may remain under water for two, or even three minutes; some modern accounts say four, and even six, but this is very doubtful. In a swimming and diving contest between some North American Indians and Englishmen in a London swimming-bath, one of the Indians, a renowned swimmer and diver, remained under water just one minute and a half, but a London artisan beat him by a few seconds.

In the *Encyclopædia Britannica*, prof. Faraday describes an interesting fact to which his attention was directed by a gentleman connected with the Asiatic society, who, according to prof. Faraday, was the first to make the observation. It was observed that by breathing hard for a short time, as a person does after violent exercise, the breath could then be held much longer than otherwise. Prof. Faraday found that he could only hold breath for three quarters of a minute, if he attempted it without preparation, but that after eight or ten of such forced inspirations, he could hold breath for two minutes. This he explained on the supposition that, ordinarily, a considerable quantity of carbonic acid remains in the involved passage of the lungs, but that it becomes completely expelled by the forced breathing, and its place supplied by atmospheric air. As regards the novelty of the observation, prof. Faraday was mistaken, as the writer of this can testify, for when a boy, he and his companion bathers in the Serpentine, in Hyde Park, commonly practiced it. The Red Indian and the artisan above referred to also did the same; it is, in fact, a sort of preparation that a practiced diver would make almost instinctively. After a few deep inspirations of this kind, a sense of giddiness is felt, and it is not prudent to carry the experiment far beyond this stage, as a fit of insensibility not unlike apoplexy is apt to result.

This giddiness, which is always produced, and the possible insensibility, indicate a different explanation from that of Faraday. The mere removal of residual carbonic acid from the lungs is not sufficient to explain these; we should rather suggest that all the phenomena result from an excessive oxygenation of the blood, and a consequently accelerated circulation similar to that produced by breathing nitrous oxide. It will be easily understood, that if the blood be forced to take an excess of oxygen, a longer time should elapse before a fresh supply would become necessary—that is, before suffocation would take place; and the giddiness, flushing of the face, and the insensibility, are results to be expected from such an excess.

Most divers suffer severely from the continual efforts in holding the breath; blood-shot eyes and spitting of blood are common among them. This rude mode of diving is now but little used except for pearl and sponge fishing; and even for these purposes, only an uncivilized people, with very little capital and knowledge, would continue to use it, as the modern applications of science afford such immense advantages for all kinds of subaqueous operations, as will be seen by the next article.

DIVING-BELL. From what has been stated in the preceding article DIVING, it will be at once understood that for all such purposes as subaqueous works upon the foundations of piers, bridges, etc., or the exploration and raising of sunken vessels, the efforts of the unaided diver would be almost valueless, and accordingly various contrivances for supplying air to the diver have been made. The *cacabus aquaticus*, or aquatic kettle, described by Taisnier as having been used by two Greeks in Spain, at Toledo, in 1538, in the presence of the emperor Charles V. and a multitude of spectators, is one of the earliest reliable accounts of a diving-bell. From his description, this must have been similar in principle and construction to the modern diving-bell, but of clumsy dimensions, and wanting in efficient means of renewing the supply of air. Dr. Halley's diving-bell, about 1720, was a wooden chamber of about 60 ft. internal capacity, open at the bottom, where it was loaded with lead to keep it perpendicular in its descent. Strong pieces of glass were set in the upper part to admit light. Casks filled with air, and loaded with lead, were let down with the bung-hole downwards; and from these a supply of air was drawn by means of a hose. The form of diving-bell now in use was first constructed by Smeaton for the works at Ramsgate harbor, 1788. It was of cast-iron, and weighed 50 cwt.; its height, 4½ ft; length, the same; and width, 3 feet. It sunk by its own weight, and was lighted by stout pieces of bull's-eye glass firmly cemented by brass rings near the top. The principle of the diving-bell will be easily understood by floating a piece of lighted candle or a wax-match on a cork, and then covering it with an inverted tumbler, and pressing downwards; the candle will descend below the level of the surrounding water, and continue burning for a short time, although the tum-

bler be entirely immersed. The reason is obvious enough: the air in the tumbler having no vent, remains in it, and prevents the water from occupying its place, so that the cork and candle, though apparently under water, are still floating, and surrounded by the air in the tumbler; the candle continues burning until the oxygen of the air is exhausted, and then it goes out, as would the life of a man under similar circumstances. If vessels full of air, like the barrels of Dr. Halley, were submerged, and their contents poured into the tumbler, the light might be maintained; but this could be better done if a tube passed through the tumbler, and air were pumped from above through the tube into the tumbler.

The modern diving-bell, which is made of cast-iron like Smeaton's, is supplied with air in this manner. It must be remembered that air is compressible, and diminishes in bulk in proportion to the pressure, so that at a depth of about 33 ft. in water, it would occupy half the space it filled at the surface; if the inverted tumbler were carried to this depth, it would be half filled with water. A considerable quantity of air has, therefore, to be pumped into the diving-bell, merely to keep it full as it descends; the air thus compressed exerts a corresponding pressure, and would rush up with great force if the tube were open and free. This is prevented by a valve opening downwards only. When the diving-bell has reached its full depth, the pumping is continued to supply air for respiration; and the redundant air overflows, or rather *under*flows, by the open mouth, and ascends to the surface in great bubbles. The diving-bell is provided with a platform or seat for the workmen, and suspended from a suitable crane or beams projecting from a barge or pier; men above are stationed to work the pumps, and attend to the signals of the bellman. These signals are simply made by striking the sides of the iron diving-bell with a hammer, and as sound is so freely communicated through water, they are easily heard above. One blow signifies "more air;" two blows, "stand fast;" three, "heave up;" four, "lower down;" five, "to eastward;" six, "to westward," etc. These, of course, may be modified as agreed upon. Messages are also sent up, written on a label attached to a cord. The sensations produced in descending are rather curious. Immediately on the mouth of the diving-bell striking the water, a feeling like a slight blow on the internal ear is produced; a dull ringing in the ears and a sense of deafness follows.

The workmen accustomed to subaqueous existence do not suffer these inconveniences; novices feel pains in the head and ears, but these pass away after a short initiation. It is stated that one man who had suffered from difficulty of breathing was completely cured by "belling," and that deafness is not produced by it, but, on the contrary, is in some cases relieved.

DIVING-DRESS. In Schott's *Technica Curiosa*, published in 1664, is described a *lorica aquatica*, or aquatic armor, which consisted of a leathern dress, to protect the diver from the water, and a helmet. In 1721, Halley describes a contrivance of his own of nearly the same kind; its object was to enable the diver to go out from the bell and walk about; he was to be provided with a waterproof-dress, and a small diving-bell, with glass front, as a helmet over his head, which was to be supplied with air by means of a tube from the diving-bell.

The modern diving-dress is made of india-rubber cloth; a strong metal helmet, with round pieces of plate-glass in front, rests upon a pad on the shoulders; the air is supplied to this helmet from above, in the same manner as for the diving-bell, but instead of the waste air passing out below, a second tube carries it up. Leaden weights are attached to the side of the diver, and thus he may descend a ladder and walk about below. He carries with him one end of a cord communicating with the assistants above, and by pulling this, as agreed upon, makes a series of signals.

DIVINING-ROD—often called the *virgula divina*, the *baculus divinatorius*, the caduceus or wand of Mercury, the rod of Aaron, etc.—is a forked branch, usually of hazel, and sometimes of iron, and even of brass and copper, by which it has been pretended that minerals and water have been discovered beneath the surface of the earth. The rod, when suspended by the two prongs, sometimes between the balls of the thumbs, will distinctly indicate, by a decided inclination, it is alleged, the spot over which the concealed mine or spring is situated. Other powers are ascribed to the divining-rod, but this is the chief. Many men, even of some pretensions to scientific knowledge, have been believers in the occult power ascribed to this magic wand. Agricola, Sperlingius, and Kirchmayer, all believed in its supernatural influence. So did Richelet, the author of the dictionary. The learned Morhoff remained in suspense, while Thouvenot and Pryce, in the latter part of the 18th c., gave ample records of its supposed power. Bayle, in his dictionary, under the word *abaris*, gives some ingenious arguments both for and against the divining-rod. In a work published by Dr. Herbert Mayo in 1847 and 1851, entitled *On the Truth Contained in Popular Superstitions*, he gave some curious illustrations of the art, supposed to be possessed by one in forty of the Cornish miners. At Weilbach, in Nassau, he likewise met with one Edward Seebold, who, he says, possessed the power, but afterwards lost it. Arthur Phippen, in 1853, published a pamphlet containing an account of two professional diviners or dowsers. One of them, named Adams, gave remarkable indications of being able to detect water under-ground. He

not only was able to discover the particular spot where water might be found—he could even perceive a whole line of water running under-ground.

Scientific men, who have bestowed any care on the examination of nature, regard this alleged power of the divining-rod as an unconscious delusion, ascribing the whole phenomenon to the effect of a strong impression on the mind acting through the agency of the nerves and muscles. See ANIMAL MAGNETISM.

DIVRIGI (anc. *Tephrene*), a t. of the province of Sivas, Asia Minor, on the Kurner-Su, a branch of the Euphrates, 28 m. n.w from Arabkir. Pop. supposed to be about 10,000.

DIVISIBIL'ITY is that property of quantity, matter, or extension, through which it is either actually or potentially separable into parts. Whether matter is or is not indefinitely divisible, is a question which has occupied the minds of philosophers since very early times. See ATOM. There is no doubt that, abstractly speaking, it is indefinitely divisible. We cannot conceive any body or space so small but that we can subdivide it in imagination, and thus figure to ourselves bodies and spaces still smaller; and practically, we know that the subdivision of matter is carried in nature far beyond appreciation either by our senses or by calculation. The diffusion of odors through the air for long periods from odoriferous bodies without their suffering any sensible change of weight, and the tinging of great quantities of fluid by very minute portions of coloring matter, are cases commonly appealed to in proof of the extreme fineness of certain material particles; while, by experiment, it is shown that there is no practical limit to the divisibility of even the most solid substances. Thus, an ounce-weight of silver, gilt over with eight grains of gold, has been drawn out into a wire 13,000 ft. long, which was all its length covered with the gold; and a tube of glass presented to the blow-pipe has been drawn out till it became as fine as a silk fiber, or $\frac{1}{3000}$th of an inch thick, still retaining its character as a tube with a distinct interior and exterior surface. In fact, in theory, great and small are mere terms of relation; under the microscope, objects invisible to the eye appear of considerable bulk; and as sir John Herschel, in his celebrated *Introduction to the Study of the Physical Sciences*, has put it, there is no reason why a mote in a sunbeam should not be in itself a world. With regard to the indefinite divisibility of space, it may be demonstrated geometrically; and perhaps, after all, it is the feeling that space is infinitely divisible, which compels our minds most strongly to resist the notion of ultimate atoms with definite forms, as conceived in the corpuscular theory.

DIVISIBILITY, in the theory of numbers, means the capability of any number of being divided by another without remainder. To find the condition of divisibility of one number, N, by another, D. Let $N = b_m r^m + b_{m-1} r^{m-1} + \ldots b_1 r + b_o$. See NOTATION. Then $N = b_m (D + (r = D),^m + b_{m-1} (D + r - D)^{m-1} + \ldots + b_1 (D + r - D) + b_o$. Expanding the different terms of the right-hand side of this equation, it will appear that $\frac{N}{D}$ will be a whole number, if $b_o + b_1 (r - D) + \ldots + b_m (r - D)^m$ be divisible by D. Hence, if $r = 10$, or the number be in the denary scale, and $D = 9$, and therefore $(r - D) = 1$, any number will be divisible by 9, if $b_o + b_1 + b_2 + \ldots + b_m$ is so, or if the sum of its digits is divisible by 9.

DIVI'SION, one of the four principal rules of arithmetic, is that by which we find how often one quantity is contained in another. It is a compendious method of subtraction, by which we can at once take one number from another as often as it is contained in it. There are three numbers concerned in D.: the dividend, or number to be divided; the divisor, or that by which the dividend is to be divided; and the quotient, or the number expressing how often the divisor is contained in the dividend. The symbols of D. are $b) a$ (, $\frac{a}{b}$, or $a \div b$, where a is the dividend, and b the divisor.

There are various methods of D., such as the English, Flemish, Italian, Spanish, German, and Indian methods, which differ merely in the manner of arranging and disposing the numbers. The English method will be found explained in all the ordinary text-books of arithmetic. There are also rules of D. for the D. of integers, fractions, and algebraical quantities. The general rule for the D. of vulgar fractions is to multiply the one by the reciprocal of the other. The D. of decimal fractions is performed in the same way as the D. of integers. And, in algebra, D. is practically performed as in arithmetic, either by making a fraction of the dividend and divisor, and reducing the numerator and denominator by the parts common to both, or else by dividing the former by the latter, after the manner of long division. See any text-book on algebra. For D. by logarithms, see LOGARITHMS.

DIVISION, BENEFIT OF. By the law of Scotland, co-cautioners are each ultimately liable for the whole debt which they have guaranteed. Each, however, is liable only for his own proportion, so long as the others are solvent, provided he has not expressly renounced that privilege, or is not bound conjunctly and severally with the principal debtor, and the debt must thus be divided amongst them. The law of D. is not affected by the mercantile law amendment act; and it is therefore necessary, where there are more cautioners than one, that all should be proceeded against.

DIVISION, MILITARY, is one section of an army, indefinite in point of numbers, but established as a matter of convenience. It often comprises infantry, cavalry, and artillery, and is in effect a small army in itself, commanded by a general officer. In the Crimean war, for instance, a British D. comprised two brigades, each of three or four battalions.

DIVISION, MILITARY (DISTRICTS, MILITARY, *ante*). For convenience and to fix responsibility, the United States is divided into military divisions, viz.: 1. Division of the Missouri, comprehending the departments of Missouri, Dakota, Texas, and the Platte; head-quarters Chicago. 2. Division of the Pacific, including the departments of California, Columbia, and Arizona; head-quarters San Francisco. 3. Division of the Atlantic, including the departments of the east, the south, and West Point; head-quarters New York.

DIVISION, NAVAL, was a secondary group of ships in a large fleet, generally three to a squadron. In a very large and complete fleet, there might be as many as nine admirals or flag-officers commanding nine divisions, in three squadrons of three divisions each. The distinction of squadron has now been abolished, and individual ships are too gigantic to allow of large numbers being maneuvered in one fleet.

DIVISION OF LABOR, or DIVISION OF EMPLOYMENT, a term often used by political economists to express a means by which labor is economized, or, as another method of stating the same result, by which production is increased. The problem in division of labor is so to adjust matters in any given community that each member of it shall work, or be able if he pleases to work, with the greatest possible results. In practice it is, like most other arrangements, apt to be too broad or too narrow. The old term, "jack of all trades and master of none," expresses the truth, that people who try too many things are not likely to be adepts in any. On the other hand, few people can do any sort of work to great perfection, unless it is part, as it were, of a group of functions for which they are more or less prepared. A good dentist will be in some measure a surgeon; a conveyancer or a special pleader will know something of the other departments of legal practice; a shipwright will be able, on occasion, to do other kinds of carpentry, and he will be the better of a general knowledge of the mechanical powers. That division of labor, in fact, which is really productive, is where a man who can do several things selects one as that which he can do best, or has most opportunity of doing. By constant practice at that one thing, and the withdrawal of his attention from other matters, he achieves perfection and rapidity of execution. There is an important difference between this selection of a special pursuit, and the inability to do anything more than one thing, which is often confounded with it. In the former case, the worker, whether with head or hand, has great resources, for his adopted pursuit is the best out of several others, on which he can fall back. The man who can do only one thing is in a precarious condition, because that one thing may be superseded. Indeed, as the one thing which can be so done is generally a very simple thing, it is almost a law in political economy that it will come to be superseded by machinery. Such was the fate of the hand-loom weavers, whose function, especially in the plainer and lighter fabrics, was too easy to last. Of the division of unskilled and easy labor, there is an excellent illustration in Adam Smith's description of pin-making: "One man draws out the wire, another straights it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business; to whiten the pin is another; it is even a trade by itself to put them into a paper; and the important business of making a pin is in this manner divided into above eighteen distinct operations, which in some manufactories are all performed by distinct hands." This division was doubtless useful, so long as pins were made entirely by human hands. It prompted serious inquiries, however, how far such functions were of an improving or a deteriorating character, and essays were written to prove that in manufacturing countries human beings were deteriorating, as no one of them had the faculty of self-support in separation from his fellows, and none could even make one single article by himself, all being dependent for their bread on a complex co-operation, which might break down any day. The answer to such fears may be found in the pin-making of the present day, where one man tends a machine, feeding it with wire at one end, while the pins drop out at the other. This, too, is the fruit of division of labor, for many skillful heads and hands have been occupied in bringing to perfection the different parts of the machinery. It is of the highest importance to the working-classes of a country, to keep in view that though the division of labor does sometimes create functions which, while they are extremely simple and easy, are of value as helping other functions to go on, yet this kind of easy and uniform work has no stability in it, and the possession of the facility for doing it acquired by practice is no permanent industrial endowment, since it is pretty sure some day to be superseded by machinery.

DIVI'SOR. See DIVISION. See also PRIME NUMBERS.

DIVORCE is defined by a Scottish writer to be "the disruption, by the act of the law, of the conjugal tie, made by a competent court on due cause shown."—Fraser, *Pers. and Domestic Relations*, i. 645. This definition correctly expresses the law of D. as it

now stands in the United Kingdom. There are some differences of detail in the working of the law in England and Scotland, which will be noticed below.

The desire to obtain a release from the matrimonial bond has existed at all times and under all legal systems. In heathen nations this release was often granted on the slightest grounds. Even among the Romans, marriage was regarded as little more than a conventional union, to be observed so long only as it suited the mutual convenience of the spouses. Christian nations, on the other hand, adopting as the basis of their systems the Scriptural law as declared Matt. xix. 9, Mark x. 9–11, Luke xvi. 18, and 1st Cor. vii. 10, 11, are agreed in considering marriage a sacred tie, not to be dissolved except on the ground of unfaithfulness to the marriage vow. Even this limited ground for dissolution of marriage is denied by a large portion of the Christian world. By the civil law, as it existed for some centuries after Christianity, a greater laxity was allowed in regard to divorce. The emperor Constantine was the first to prohibit dissolution of marriage by simple consent of the parties. This practice was again revived under the emperors Theodosius and Valentinian; and though those emperors subsequently rescinded this edict, yet the rule as to the grounds on which marriage might be dissolved continued to fluctuate. By the canon law, marriage was regarded as a sacrament; and though marriages contracted in disobedience to certain rules might be declared null *ab initio*, a marriage validly contracted would not be dissolved except by papal dispensation. But the rule of the canon law was not uniformly adopted by the states of Europe, and it was not till the famous council of Trent issued a decree, in its 24th session, in 1562, declaring marriage indissoluble even after the adultery of one or both of the parties, that a uniform rule on the subject was established. But before this decree was issued, the reformation had made progress throughout Europe, and thus a change again took place in regard to the law of divorce. It should be observed, that though by the canon law D. *a vinculo matrimonii* was unattainable, parties might obtain a separation *a mensâ et thoro*. The nature of this remedy will be explained below.

Roman Catholic countries adopted the principle laid down by the council of Trent, and this rule continues to be in force in most countries which are in the Roman Catholic communion. But by the code civile of France, D. is allowable on the ground of adultery and certain other causes. Countries which adopted the reformed religion, have varied greatly in the rules established in regard to the question of divorce. In Holland D. is permitted on the ground of adultery and desertion. In America, the practice varies in different states. "In several of them no D. is granted but by special act of the legislature, according to the English practice; and in others, the legislature itself is restricted from granting them, but it may confer the power on courts of justice. So strict and scrupulous has been the policy of South Carolina, that until recently there was no means of obtaining a D. of any kind, either by sentence of a court of justice or by act of the legislature. In all other states, D. *a vinculo* may be granted by courts of justice for adultery. In New York, the jurisdiction of the courts as to absolute D. for causes subsequent to marriage is confined to the single cause of adultery; but in most of the other states, in addition to adultery, intolerable ill-usage or willful desertion, or unheard-of absence, or habitual drunkenness, or some of them, will authorize a decree for D. *a vinculo* under different modifications and restrictions."—Kent, *Comm.* iv. 105. In England, previous to the passing of the late divorce and matrimonial act, marriage was by the common law indissoluble. It was, indeed, competent to obtain a declaration of nullity of marriage on the ground of relationship, previous marriage of one of the parties, mental or physical incapacity, or coercion. But the judgment so obtained was not a decree of D., but a declaration that the marriage tie between the parties had never really been contracted. A wife may now obtain a D. on the ground of the husband's incestuous adultery; or of his bigamy with adultery; or of rape; or of sodomy; or of adultery coupled with gross cruelty; or of adultery coupled with desertion without reasonable excuse for two years. The husband may obtain a D. on the ground of the wife's adultery. But neither party can obtain a D. on the ground of mere desertion alone, however long continued. The court may order the husband to pay a divorced wife a certain sum for her maintenance during their joint lives. A decree of D. does not come into full force until six months after it is pronounced. The bars to a D. are condonation, connivance, or collusion. When divorced, the parties are at liberty to marry with third parties. When the D. is on the ground of adultery, both parties may be examined as witnesses, 32 and 33 Vict. c. 68.

In Scotland, D. may be obtained on the ground of adultery or willful desertion. Immediately after the reformation, the courts in Scotland recognized the right of either spouse to obtain a D. on the ground of adultery. And in the year 1573, a statute was passed declaring that, in case either husband or wife should desert without due cause for four years, the injured party might raise an action of adherence, and, in case redress was not obtained, a decree of D. might be pronounced. In Scotland, it is not permitted that a marriage should take place between the offending parties. The effect of a decree of D. on the pecuniary interests of the parties, is to cause the offender to forfeit all benefit which might accrue to him or her from the marriage. Separation *a mensâ et thoro* may also be obtained in Scotland on the ground of ill usage, and perhaps desertion (q. v.). Condonation and collusion, but not recrimination, are, in Scotland, a bar to obtaining a dissolution of marriage on the ground of adultery.

DIVORCE (*ante*) in this country depends upon the statutes of the several states, and there is great variety among them. In South Carolina a divorce is not allowed for any cause; in New York for adultery only; but in most of the states it may be granted for several causes, as adultery, cruelty, willful desertion for a certain period, habitual drunkenness, etc. In some states the matter is left wholly or in part to the discretion of the court. The principal defenses in suits for divorce are the same as in the English courts. The consequences of divorce are such as flow from the sentence by operation of law, or flow from either the sentence or the proceeding by reason of their being directly ordered by the court and entered of record. In regard to the former, they are chiefly such as result immediately and necessarily from the definition and nature of a divorce. Being a dissolution of the marriage relation, the parties no longer have any of the rights nor are they subject to any of the duties pertaining to that relation. They are thenceforth single persons to all intents and purposes. It is true that the statutes of some of the states contain provisions disabling the guilty party from marrying again; but those are in the nature of penal regulations, collateral to the divorce, and which leave the latter in full force. In regard to the rights of property as between husband and wife, a sentence of divorce leaves them as it finds them. Consequently all transfers of property which were actually executed, either in law or in fact continue undisturbed; forexample, the personal estate of the wife reduced to possession by the husband, remains his after the divorce the same as before. But it puts an end to all rights depending upon the marriage, and not actually vested; as, dower in the wife, all rights of the husband in the real estate of the wife, and his right to reduce to possession her right to collect debts or damages for breach of contract. In New York, however, with respect to dower it has been settled that immediately upon marriage being solemnized the wife's right to dower becomes perfect, provided only that she survives her husband. Alimony during proceedings for divorce is a frequent question, usually in the discretion of the court. The custody of children is another and more important question. The general principle is to consult the welfare of the child rather than any supposed rights of either parent; but in considering the rights of parents the innocent parent is preferred before the guilty. In the absence of a controlling necessity, or very strong propriety arising from the circumstances of the case, the father's claim has preference.

DIVORCE AND MATRIMONIAL COURT. An act of parliament of 1857, with amending acts, changed the law of England on the subject of divorce. By the first of these acts, the jurisdiction in divorce causes is transferred from the ecclesiastical courts to a new court constituted for the purpose, which, since the judicature act (1873), is included in the probate, divorce, and admiralty division of the high court of justice. It is provided that either spouse may obtain a divorce on the ground of adultery; but in case the wife is petitioner, the adultery must be accompanied by cruelty or desertion. By 23 and 24 Vict. c. 144, the power to pronounce a decree of divorce, which was at first reposed in the whole court, is given to the judge who hears the cause; but in this case the decree so pronounced is a decree *nisi*, and cannot become final for at least six months. After decree of divorce, the offending party is free to marry again even with the paramour. But it is enacted, 20 and 21 Vict. c. 85, sect. 57–58, that no clergyman shall be compelled to solemnize the marriage of any person who has been divorced. He must, however, allow another clergyman, if willing to do so, to perform the marriage. A party applying for a divorce will not be allowed to obtain judgment, should it appear that he or she has been guilty of recrimination by committing the same offense, or that there is collusion between the parties in order to procure the divorce. Parties also who have condoned the offense—that is, who after it has been discovered have consented again to live as husband and wife—will not be allowed to obtain a divorce. In order to guard against fraud by parties conniving to procure a divorce, power is given to the queen's proctor, by 23 and 24 Vict. c. 144, to interpose, in case he have reasonable ground to suspect collusion or recrimination, in order to oppose a petition for divorce. By these acts, parties are also entitled to obtain a judicial separation on the ground of adultery, cruelty, or desertion. Judicial separation is declared to be in place of a seperation *a mensâ et thoro*. A married woman, having obtained decree of judicial separation, is declared to be in all respects as a *feme sole* in regard to any property that she has or may acquire. Even before obtaining a separation, a woman deserted by her husband may obtain from the court a protection for any property which she may acquire by her own industry.

From the conflict of laws in various countries on the subject of divorce, questions have frequently arisen as to the competency of a sentence of divorce by a tribunal having power according to the *lex loci* to pronounce such sentence, to annul a marriage contracted in a country where such divorce is not allowed. It appears now to be the generally received opinion, that wherever parties are domiciled they will be allowed to avail themselves of the laws of this domicile. But the courts will not recognize a transient visit to a foreign country as sufficient ground to sustain a divorce. On the subject of this article, see Paterson's *Compendium of English and Scotch Law;* Fraser's *Personal and Domestic Relations;* and Swabey *On the Divorce and Matrimonial Act.*

DIX, Dorothea Lynde, b. Mass., 1794. She established a school for girls in Boston, and took much interest in the unfortunate and criminal classes. In 1834, she went

to Europe to study methods of the treatment of paupers, criminals, and insane persons. After a great deal of exertion she induced congress to pass a bill granting ten millions of acres of land to endow hospitals for the indigent and insane, but the measure was vetoed by president Pierce. During the rebellion she was superintendent of hospital nurses for the union army. Among her publications are *Garland of Flora; Private Hours; Alice and Ruth; Conversations about Common Things;* and *Prisons and Prison Discipline.*

DIX, JOHN ADAMS, LL.D., 1798–1879; b. N. H.; a politician and soldier. In the war of 1812, he served as an ensign on the Canada frontier. In 1828, he began the practice of law in Cooperstown, N. Y., and became one of the leaders of the democratic party. In 1830, he was adjutant-gen. of the state, and in 1833, secretary of state and superintendent of common schools. He was chosen member of the assembly in 1842, and in 1845, appointed to fill a vacancy in the U. S. senate. In 1848, when the democratic party divided on the question of the extension of slavery, he went with the "free soil" wing and was their candidate for governor, but was not elected. In 1853, he was assistant treasurer of the United States in the city of New York. In 1860, he was chosen secretary of the treasury. Secession was just beginning, and New Orleans was substantially in the hands of the confederates. Two revenue cutters there were ordered to New York by the secretary. The captain of one of them refusing to obey, secretary Dix immediately telegraphed to have him arrested and treated as a mutineer if he offered any resistance, closing the dispatch with the words: "If any man attempts to haul down the American flag, shoot him on the spot." In 1861, Dix was appointed maj.gen. of militia, and the same year maj.gen. of U. S. volunteers. In 1862, he was placed in command of the department of Maryland, and about the same time was sent to Fortress Monroe in command of the seventh army corps. He was in command in New York city at the time of the riots, July, 1863, and in 1864–65, commanded the department of the east. In the autumn of 1866, he was minister to France, and resigned, 1868. In 1872, the republican party elected him governor of New York. He retired in 1875, and passed the remainder of his life in private. Besides miscellaneous papers he was the author of *Resources of the City of New York; Decisions of the Superintendents of Common Schools of New York, and Laws relating to Common Schools; A Winter in Madeira; A Summer in Spain and France;* and two volumes of speeches.

DIX, MORGAN, S.T.D., b. New York, 1827; son of John A.; a clergyman of the Protestant Episcopal church, graduate of Columbia college and of the Protestant Episcopal general theological seminary. He was ordained in 1853, and in 1855, became assistant minister of Trinity church, New York. In 1859, he was assistant rector of the parish, and in Nov., 1862, after the death of Dr. Berrien, he succeeded as rector, where he still remains. He has published, among other works, *A Commentary on the Epistle to the Romans; An Exposition of the Epistles to the Galatians and Colossians; Lectures on the Pantheistic Idea of an Impersonal Substance Deity; Essay on Christian Art;* and *Lectures on the Two Estates*, that of the *Wedded in the Lord*, and that of the *Single for the Kingdom of Heaven's Sake.*

DIXIE, a popular name for the Southern states of the American union, much in use about the time of the attempted secession. It seems to have been adopted from a song of the slaves which set forth the delights of a region where they were under a good master—the region being called Dixie's Land, from a well-known kindly slave-holder of that name. The old song, or one based upon it, became widely favored as a sectional rival of *Yankee Doodle.*

DIX ISLAND, off the Maine coast, about 10 m. s.e. of Rockland; a remarkable deposit of excellent granite, from which the New York post-office, the treasury building at Washington, and many other fine public buildings have been constructed. There are probably 1500 men and one or two hundred women and children on the island. Quarrying is the only business.

DIXON, a co. in n.e. Nebraska, bordering on the Missouri river; 700 sq.m.; pop. '76, 3,263. It has a level surface and fertile soil. Agriculture is the chief business. Co. seat, Ponca.

DIXON, a city, seat of justice of Lee co., Ill., on Rock river, at the crossing of the Chicago and Northwestern and the Illinois Central railroads; 98 m. w. of Chicago; pop. 4,055. It has good water-power, and a number of manufactories.

DIXON, JAMES, D.D., 1788–1871; an English Methodist preacher of the Wesleyan conference. In 1824, he was a missionary at Gibraltar; 1828–33, a preacher in London; afterwards in Liverpool, and superintendent of the Sheffield and Manchester circuits. In 1841, he was president of the British conference, and in 1848 was sent by the Wesleyan body as delegate to the general conference in the United States. He published *Methodism in its Origin, Economy, and Present Condition; Notes on America; The Present Position and Aspects of Popery, and the Duty of Exposing the Errors of Papal Rome*, etc.

DIXON, WILLIAM HEPWORTH, an English author, was born in the West Riding of Yorkshire in 1821, and settled in London in 1846, where he soon acquired a considerable reputation by his writings. A series of papers published in the *Daily News*, "On the Literature of the Lower Orders," and another on "London Prisons," attracted

considerable attention. The latter reappeared in a volume published in 1850. Before this, but in the same year, he published *John Howard, and the Prison World of Europe*. It was with difficulty he could induce the publisher to accept it, yet when published, it went through three editions in one year. D. now devoted himself principally to historical biography. In 1851, appeared the first edition of his *William Penn*, a work called into existence by the onslaught made by Macaulay on the eminent Quaker, in which D. undertook to disprove Macaulay's charges. In 1853 was published his *Life of Blake;* and in the same year an anonymous pamphlet, entitled *The French in England*, designed to allay the fear of a French invasion then prevalent. In 1853, D. was appointed editor of the *Athenæum*—a chair he vacated in 1869. In 1860, he published his *Life of Lord Bacon*, and in 1863, *The Holy Land*. He gave the public *New America* in 1867; *Spiritual Wives* in 1868; *Free Russia* in 1870; *The Switzers* in 1872; *History of Two Queens* in 1873–74; *White Conquest* in 1875; and *British Cyprus* in 1879.

DIXON'S ENTRANCE, a strait of 100 m. in length from e. to w. on the n.w. coast of America, divides Queen Charlotte island on the s. from the Prince of Wales archipelago on the north. It is, therefore, of some political importance, as separating the British possessions in this quarter from those of the United States. Lat. 54° 30′ n., and long. 132° west.

DIXWELL, JOHN, 1609–89; of a good family in Kent; one of the judges of Charles I. After the accession of Charles II. he was condemned to death, but fled to America, and lived undiscovered in New Haven, under the assumed name of John Davids.

DIZFUL, a t. of Persia, on the river Dizful, in lat. 32° 10′ n., and long. 48° 34′ east. It is the capital and principal mart of its province (Khuzistan). A handsome bridge of twenty arches crosses the river here. The foundation is of stone and of ancient date, the upper portions are of brick and are modern. Pop. estimated at 15,000.

DIZIER, ST., a t. of France, in the department of Haute-Marne, 10 m. n. of Vassy, is situated on the Marne, which here begins to be navigable. It is a very long and narrow, but well-built town, the streets being wide, clean, and regular. In 1544, D. resisted for a month the assaults of a Spanish army under Ferdinand de Gonzaga; a resistance of the greatest consequence to the French ruler, Francis I., the delay enabling him to collect his forces to oppose the march of the Spaniards upon Paris. In 1814, the French twice defeated here the invading army of the allies. The chief industrial features of the place are iron forges and foundries, boat-building yards, in which a great number of river and canal boats, generally of about 100 tons, are constructed, and cotton factories. There is also a considerable trade in wood, iron, and grain. Pop. '76, 9,453.

DJEZZAR, i.e., *Butcher*, the name given, on account of his cruelty, to Achmed pasha, famous for his obstinate defense of Acre against Napoleon I. He was born in Bosnia about 1735, and rose, through murder and treason, from the condition of a slave to the pashalic of Acre. In the beginning of 1799, the French entered Syria from Egypt, and advanced from victory to victory till they reached Acre, which was laid siege to on the 20th Mar. By the advice of col. Philippeaux, a French émigré, and of sir Sydney Smith, the commander of the British fleet in the Levant, D. was induced to hold out; and such was the savage doggedness of his resolution, that Bonaparte was obliged to retire on the 21st of May. It is said that during the siege he sat on the floor of his palace, surrounded by a heap of gory skulls, distributing money to all who brought in the heads of Frenchmen. He died at Acre in 1804. D. was at times maniacal in his cruelties. He whipped off the heads of his wives without the slightest ceremony—seven at a time! But he had also moments of remorseful tenderness, in which he helped the poor and provided for those he had injured. He is said to have possessed the sharpest discernment, and was a very vigorous ruler.

DMITROV, an ancient t. of Russia, on the Jakhrama, an affluent to the Volga, 40 m. n. of Moscow. It covers a large area, a considerable part of which is occupied by gardens, but as a whole is poorly built. It contains a college and seven churches, and has manufactures of silk and cotton goods, tanneries, etc. Pop. '67, 8,042.

DNIE'PER, one of the large rivers of Europe; has its source in certain swampy forestlands in the n. of the Russian government of Smolensk. Its general direction, until it reaches Kiev, is south. From Kiev, its course is s.e. to Ekaterinoslav, where it turns directly s. past Alexandrovsk, below which town it sweeps round to the s.w., and pursues that direction until it debouches in the Black sea, between the governments of Kherson and Taurida, its embouchure forming a gulf of about 50 m. in length, with a breadth of from 1 to 6 miles. Its principal affluents are the Desna and Soj from the e., and the Pripet, the Beresina, and the Druz from the west. The total length of the D. is upwards of 1000 m., and it is navigable almost from its source, its breadth at Dorogobush, about 50 m. below its source, being 210 feet. Some of the finest governments of the Russian empire lie within its basin, with all of which its navigable branches and canals enable it to hold communication. In its upper part, it flows through a marshy forest territory; its middle and lower course is rocky. Below Ekaterinoslav, indeed, there are no less than 13 rapids in the course of about 40 m.; but these impediments to navigation have been overcome in part by blasting, and by splendid hydraulic-works erected by the Russian government. The produce of the provinces, consisting for the most part of corn, timber, iron, salt,

hemp, and linen, are usually conveyed down the river to ports on the Black sea, but many vessels pass annually from the D. to the Baltic by the Beresina and the Dwina. At Smolensk, the waters of the D. are frozen from Nov. to April; at Kiev, they are ice-bound only from Jan. to Mar. Sturgeon, carp, and pike abound in the river. As the *Borysthenes* the river was known in the 7th c. B.C. to the Greeks, who regarded it as the most valuable river on earth next to the Nile.

DNIE'STER, a river of Europe, flowing chiefly through Russia, but having its rise in the Carpathian mountains, in the Austrian crown-land of Galicia, about lat. 49° 10′ n., long. 23° east. Its general course, until it reaches the Russian territory, is s.e.; it then runs e. for a short distance, and thence s.s.e., forming the boundary between Besserabia and Kherson, past Mohilev, Dubossari, and Bender, to the Black sea, which it enters by a shallow shore lake, 19 m. in lengt hand 5 in breadth, between Akerman and Ovidiopol. The total length of the D. is between 500 and 600 m., its current throughout being very rapid. Until it reaches the Russian frontier, its right bank is skirted by offsets from the Carpathians; but at that point, the country, which above has been level on only one side, opens into a broad flat plain, through which the river, broken at intervals by masses of rock, rushes muddy and turbid. The downward navigation is interrupted by a series of falls and whirlpools. Wood and grain are the chief products conveyed down the river.

DÖAB', a word of Sanscrit origin, signifying primarily "two rivers," but applied, like the Gr. *mesopotamia,* and the Lat. *interamna,* to the country between two rivers. The two roots of the word are common to all the Aryan languages: the first appears in Lat. *duo,* Eng. *two;* the second in Celt. *avon,* a river, and in Dan*ube* or Don*au*. Punjab ("five rivers") is a term of the same kind; but while Punjab exists merely as a proper name of one particular region, Döab is used as the common appellation of any region in general that fulfills the conditions. When introduced, however, without local reference of any kind, the Döab means the space inclosed by the Jumna on the s.w. and the Ganges on the n.e.—a space extending from Allahabad to the base of the Himalayas, a distance of upwards of 500, with an average breadth of 55 miles. The fertility of this region has been much increased by the Ganges canal (q.v.).

DOANE, GEORGE WASHINGTON, D.D., LL.D., 1799–1859; b. N. J.; graduate of Union college in 1818; ordained 1821, and rector for three years in Trinity (Prot. Ep.) church, New York. He was assistant minister and rector of Trinity church, Boston, 1828–32, and was then chosen bishop of New Jersey. While in this office he made special efforts for higher Christian education, and opened St. Mary's Hall at Burlington, on the Delaware river, a boarding-school for girls. In 1846, he founded Burlington college. His denomination flourished greatly under his episcopate. He published a volume of poems and a volume of sermons.

DOBCHICK. See GREBE.

DOBELL, SYDNEY, a modern English poet, was b. in London in 1824. His father, who was a wine-merchant, removed to Cheltenham in 1835. Here D., whose education was entirely private, lived till 1850, when the *Roman* was published, and received with favor by the literary world. After the publication of this poem, D. resided for some time in Switzerland. Shortly after his return, the delicate state of his wife's health brought him to Edinburgh, where he remained till 1857. He afterwards resided on the Cotswold hills, near Gloucester. Besides the *Roman,* D. published *Balder* (1854), *Sonnets on the War,* in conjunction with Mr. A. Smith (1855), and *England in time of War* (1856). His poems exhibit a singular mixture of the philosophical and the poetical spirit. Many of his passages are as spiritual in conception and lavish in imagery as the finest portions of Shelley; others, again, are as obscure, intricate, and involved as the rhymed enigmas of Cowley or Donne. In 1865, D. published a political pamphlet advocating a graduated suffrage and plurality of votes; and in 1871, *England's Day,* a lyric. He died in 1874. A collected edition of his poems was published in 1875; and in 1876, *Thoughts on Art, Philosophy, and Religion.* See *Life and Letters of Sydney Dobell* (1878).

DÖ'BELN, a t. of Saxony, 36 m. s.e. of Leipsic, is situated on an island formed by the Mulde. It is well built, and contains a richly endowed hospital. Its chief manufactures are linen, woolen, and cotton cloth, brass-ware, and hats. D. has also several bleach-fields and worsted mills. Pop. '75, 10,969.

DOB'RIZHOFFER, MARTIN, 1717–91; a Jesuit missionary in Paraguay, where he labored many years among the native tribes. When the order was expelled from South America, he settled in Vienna, and enjoyed the friendship of Maria Theresa. He wrote a garrulous history of his missionary work in South America.

DOBROW'SKI, JOSEPH, the founder of Slavic philology, was b. Aug. 17, 1753, at Gyermet, near Raab, in Hungary, where his father, a Bohemian by birth, was stationed in garrison. He studied at the gymnasium of Deutschbrot, and subsequently at Klattau and Prague. In 1772, he entered the order of the Jesuits at Brünn, but on its dissolution ten months after, he returned to Prague, to continue his theological studies, and in 1776, became tutor in the family of the count von Nostitz. During the years 1780–87, he edited a critical journal of Bohemian and Moravian literature. This soon involved him in various strifes, and ultimately the review was "stopped" by the

authorities, but not before it had added largely to D.'s reputation. In 1792, at the expense of the royal Bohemian scientific society, he made a journey to Denmark, Sweden, and Russia, to search after the fate of those Bohemian books and MSS. which the Swedes had carried off from Prague during the thirty years' war. Two years after, he traveled through Germany, Italy, and Switzerland. On his return, he manifested symptoms of a disordered mind, and in 1801, had to be confined for some time. He speedily recovered, but was subject to intermittent fits of insanity until his death, which happened Jan. 6, 1829. D. is reckoned one of the highest, if not the very highest, authority on all matters connected with Bohemian history and literature. His principal productions are—*Scriptores rerum Bohemicarum* (Prag., 2 vols., 1783–1784); *Geschichte der Böhm. Sprache und ältern Literatur* (Prag. 1792); *Die Bildsamkeit der Slaw. Sprache* (Prag. 1799); *Deutsch-Böhm. Wörterbuch* (2 vols., Prag. 1802–21), in which he was largely assisted by other eminent Bohemian scholars; *Lehrgebäude der Böhm.-Sprache* (Prag 1809); and *Institutiones Linguæ Slavonicæ Dialecti Veteris* (Vienna, 1822).

DOBRUDSCHA, or DOBRUDJA (anciently *Scythia Minor*), a region formerly Turkish, now belonging to Roumania, lies between the lower Danube and the Black sea; the Berlin congress of 1878, in transferring it to the principality, fixed the southern limit, formerly somewhat indefinite, at a line from Silistria on the Danube to Mangalia on the sea-coast. The n.e. of this region is occupied by marshes and the delta of the Danube; the rest of the area is partly steppe and partly cultivated corn-land. The inhabitants comprise a few Bulgarians and Roumanians, Tartars, Circassians, Osmanli Turks, Greeks, Armenians, and Jews. Salt is manufactured, and fishing carried on.

DO'CE RIO, a river of Brazil, about 500 m. in length; rising near the city of Ouro Preto, in the province of Minas Geraes, running n. 150 m., then e. and s.e., and then n.e. through the province of Espirito Santo, then turning to the s.e. and emptying into the Atlantic near Regencia. It is navigable in only small portions; the banks are steep, and bordered by mountains covered with deep forests.

DOCE'TÆ (from the Gr. *dokeō*, to appear or seem) was the name given in the early church to those heretics who held that the human nature of Jesus Christ was a semblance and not a reality. The philosophers of polytheism, as well as of Judaism, had explained the appearances of divinities and of angels by holding that the assumption of bodies was only momentary, or in appearance. And when the Gnostic Christians found it impossible to conceive the essential union of the divine nature with a body composed of matter, which they held to be the seat of all evil, they had recourse to the same expedient. The difficulty was got over in one of three ways: the body of Christ was either considered a real earthly body, but not belonging essentially to his nature, and only assumed for a time; or it was declared to be a mere appearance or illusion; or, finally, it was believed to be a heavenly body, composed of ethereal substance, though having the appearance of being material. All the Gnostic heretics held docetism in one or other of these three forms, with the exception of those who were led by the same difficulty to deny the divine nature of Jesus Christ, and reduce him to a mere human sage. While the first of these alternative forms of heresy seems to have completely died out, the last, under various names, has continued to the present time. For a clear and learned account of docetism, consult Neander's *Dogmengeschichte* (History of Doctrine). English by J. E. Ryland; published by H. G. Bohn, in 2 vols., 1858.

DOCK, *Lapathum*, a sub-genus of the genus *rumex*, the other species of which are generally called sorrel (q.v.), containing those which are not acid, and of which the flowers are hermaphrodite. They are large perennial herbaceous plants, natives chiefly of temperate climates, with large generally lanceolate or ovate leaves, and panicles of small greenish flowers. They have great tap-roots, and are with difficulty eradicated from pastures. They also multiply rapidly by seed. The best mode of dealing with them, is generally found to be repeated cutting away of their leaves and shoots, by which the plants are killed. Many of the species prefer watery places. A number are natives of Britain, and several of the European ones have found their way to North America, where they have become troublesome weeds, a number of really indigenous species being also found there. Useless and even troublesome as the D. is generally esteemed, yet the large astringent roots are capable of being beneficially employed in medicine; and those of the great water D. (*R. hydrolapathum*) in particular—for which the Druids entertained a superstitious veneration—are administered as an antiscorbutic. They are also employed in rheumatism, and sometimes as a styptic, sometimes to form an astringent gargle, and sometimes as a dentifrice. *R. alpinus* is called MONK'S RHUBARB, and its root was formerly employed instead of rhubarb, but is less powerful. It is a native of the Alps, and has been found in several places in Britain.—The roots of docks have been sometimes used in dyeing, and give "a great variety of shades, from straw-color to a pretty fine olive, and a fine deep-green to cloths which have been previously blued."

DOCK, an inclosure for the accommodation of shipping, and of which there are three kinds—viz., wet or floating; tidal, which may with more propriety be called harbors or basins; and dry or graving. Wet docks are for the purpose of maintaining a level nearly uniform with that of high-water, so as to keep vessels always afloat, and to save

them from rubbing up and down the quays with the rise and fall of the tide, and being sometimes too high and at other times too low for convenience in shipping or discharging cargoes.

Wet docks are generally surrounded by quay or wharf walls of masonry or brickwork, but where they are wanted chiefly for laying up vessels in, and not for loading or unloading, their margin is sometimes only a natural sloping beach. They are of most importance in places where there is a great rise and fall of tide, such as at Bristol or Liverpool, where they are almost indispensable; while, again, in the Clyde, where the tides are small, they have not long been erected, and are on a much more limited scale. Wet locks are generally entered by means of what is called a lock (see LOCK), having two gates, in one leaf, or more frequently in two folding-leaves each, which enables vessels to enter or depart for a considerable time before and after high-water; but frequently, for the sake of economy both in space and in cost, they have only one gate, so that vessels can only enter or depart at or very near high-water, unless the water in the D. be run down considerably below that level.

The water in wet docks is sometimes kept, by means of pumping, permanently at as high a level as that of the highest tides, when a supply of pure water can be procured, to prevent the silting caused by the admission of any considerable body of turbid water by the gates, but that involves the necessity of locking up or down always except at the highest tides. The tendency to silt up by deposits of fine mud is of common occurrence, and dredging, or some other plan, must be resorted to for the purpose of keeping the D. reasonably clear. In almost all cases, wet docks require to be occasionally emptied for the purpose of cleaning.

Dock-gates are generally opened and shut by means of chains worked by hand, either by winches or capstans; but of late years they have in some cases been moved by hydraulic machinery, as at Great Grimsby, the Victoria docks in the Thames, and Albert dock, Leith.

Tidal docks require no particular description; they are merely basins surrounded by quay walls, and having open entrances permitting the free flow and ebb of the tide, as at Greenock and Troon, and they have the advantage of requiring no opening or shutting of gates. With small tides, they answer very well, and they are sometimes made deep enough to keep vessels afloat at low-water; but with tides of considerable range they are attended with the disadvantage of large vessels grounding at low-water, and from the large volume of water, generally more or less turbid, which enters at every tide, they are much more liable to silt up than wet docks are. For ridding them of muddy deposits, the plan is sometimes resorted to of letting out a reserve of water with a sudden gush from an inclosure at the inner end, at the time the tide has receded. This is called scouring. Such is the process pursued at Boulogne and elsewhere.

The quays of wet and of tidal docks must have mooring-ports or rings for making vessels fast to. They are generally provided with sheds to keep goods dry, with cranes (see HYDRAULIC CRANE) for shipping or unloading heavy articles, and with staiths or drops in the case of coal-shipping ports, and now they very frequently have rails laid along them.

Dry docks are used for the purpose of laying vessels dry for examination or repairs. They may have their entrance either from a wet D. or from a tidal harbor; but the former is by much the better arrangement, as it admits of vessels being docked or taken out at any time of tide, and it keeps a more equal pressure on the gates, thereby making them less liable to leak. They require to be built of good water-tight masonry. The entrance has generally a pair of folding-gates pointing outwards, to exclude the water; but sometimes it is closed by means of a caisson—viz., a vessel shaped something like the hull of a small ship, and having a keel and two stems, which fit into a groove in the masonry. The caisson is sunk into the groove by admitting water into its interior, and is floated out again by pumping out the water. When the tides are very large, the bottom of the D. may sometimes be placed above low-water, so that it may be run dry without pumping; but generally the bottom of a dry D. for the reception of any but very small vessels is below that level, in which case a steam-engine and pumps, with a wall and water-channels leading to it, are required for emptying the dock. The floor is nearly level, and the keel of the vessel to be docked rests on wooden blocks fastened down to prevent them floating, and of such a height as to admit of the shipwrights getting under the vessel's bottom. Side-shores are put in, to keep the vessel in an upright position, and blocks are fitted in under the bilges as soon as possible after the water has been got out of the dock. The sides generally consist of stone steps called altars, for the purpose of fixing the lower ends of the shores, and also for the convenience of supporting the workmen's scaffolds. Dry docks are frequently made long enough to hold three or four vessels of considerable size at one time, in which case they are placed, not in the center line of the D., but obliquely across, so as to give more available length.

The use of the graving D. is frequently superseded by that of Morton's patent-slip. See SLIP. Graving-docks of large dimensions are very expensive works, and the difficulty of making them water-tight is very great. In many cases, therefore, recourse is had to a pontoon or floating-dock, sometimes termed a "camel." See FLOATING-DOCK. The use of the floating D., together with the application of hydraulic pres-

sure for the raising of ships, is to be seen at the "Thames graving-docks," where there are two rows of cast-iron columns, 5 ft. diameter, and 16 in each row. The rows are 60 ft. apart, and the practical working length is 350 feet. Each column incloses a hydraulic press of 10 in. diameter, with a length of stroke of 25 feet. There are cross-heads on the top of each ram, from the ends of which cross-girders extend across the D. to the corresponding column on the opposite side, which girders form a large wrought-iron gridiron or platform, which is raised or lowered at pleasure with the vessel upon it. When a vessel is to be repaired, an open pontoon is selected to suit its dimensions, which is sunk in position to the bottom of the D., and resting on the iron gridiron. After the vessel is floated over the pontoon, the whole is raised by the hydraulic presses, and the pontoon being emptied of water, sustains the weight of the vessel to be repaired, and is then floated away into some convenient part of the dockyard.

Liverpool has 20 graving-docks, many of them being 600 ft., and some even 750 ft. in length. No docks in the world are on so splendid a scale as those of London, Liverpool, and Birkenhead, which are of immense area, covering hundreds of acres. Surrounded with substantial stone quays, provided with gates, placed under a proper police, and otherwise managed in a costly manner, these, as well as nearly all other docks in Great Britain, require to be supported by rates levied from the vessels resorting to them; and for levying these rates, powers are taken in the acts of parliament authorizing the construction of the respective docks. Sometimes the D. dues or rates are imposed on vessels in bulk according to tonnage, and in other instances, the rates are so much per ton, according to the nature or value of the goods. See M'Culloch's *Commercial Dictionary*. Generally, the dues are complained of as being a heavy burden on commerce; but so enormous is the cost of constructing docks, that the joint-stock companies by which they are for the most part owned, do not often realize good returns for their investments. The most remarkable circumstance connected with English docks, is the rapid extension of the dock-system on the Mersey at Liverpool. The original old D. contained an area of 3 acres 1200 yards, and 557 lineal yards of quay space. The total quay space is now above 20 miles.

DOCK (*ante*). Docks in the United States are of not so much importance to commerce as in England, the rise and fall of the tide being far less. There is no difficulty in lading and unlading ships at the wharves of any of the Atlantic or gulf ports, and hence little need of inclosed docks. There are, however, some very fine docks for the more convenient handling of merchandise, especially of grain, sugar, cotton, etc., and for the care of valuable goods. The Atlantic docks in Brooklyn are a specimen. For the repair of vessels, the lifting dock is most in use, and generally hydraulic power is used. The graving-dock in the government navy-yard at Brooklyn is one of the finest in the world, though built on a most difficult foundation. The floor is an arch, upside down; the mason work is granite-faced, and the facing stones weigh as much as three tons. The gates are of iron, and with apparatus for opening and closing them, weigh about 400,000 lbs. The floating caisson is of iron, and weighs over 420,000 lbs. besides ballast. There is pumping power sufficient to empty the dock in two hours. The principal measurements are: length and breadth of main chambers, at bottom, 286 by 30 ft.; at top, 307 by 98. The caisson added makes the extreme length 359 feet. This dock cost over $2,000,000.

DOCKET. See DOQUET, *ante*.

DOCK WARRANTS are orders or authorities for the removal of goods and merchandise warehoused in the various docks. The orders are granted by the proper officer at the docks, on application of the importer, in favor of any one whom the latter shall name. Careful rules as to obtaining warrants are laid down by the East and West India dock and the London dock companies. These rules are, in a great measure, followed by the other dock companies in the kingdom. Unless the rules are complied with, goods will not be delivered from the docks. Warrants may be obtained for either the whole or a part of a cargo consigned. A warrant may be assigned by the holder. A single warrant may also, at the desire of the holder, be divided into smaller warrants, and these also may be assigned. In case a warrant is lost, a new warrant will not be issued till the loss has been advertised, and the holder furnish the company with an engagement to indemnify them for any loss which may arise.

DOCK-YARD BATTALIONS, prior to the establishment of volunteer corps, formed a special element in the British military service, intended chiefly for the defense of the royal dock-yards. It was in 1847 that an item first appeared in the estimates of £20,000 for training and exercising about 9,000 men in these battalions. Clerks, artisans, and laborers formed the body. The col. was a naval officer, and commissions were given to the other officers. The men received remuneration for time lost in drilling. A few hours per week in summer were set apart for drilling under the management of sergeants and corporals of marines. At first, the enlistment was voluntary; afterwards, compulsory. These battalions were abolished in 1861.

DOCK-YARDS, ROYAL. Under the names of the several towns where the royal dock-yards are situated, will be found brief notices of those establishments. Under the present heading, a few remarks may be useful concerning the whole of them collectively.

Most of the royal ships are built by the government, at one or other of the dock-yards at Portsmouth, Plymouth, Sheerness, Chatham, or Pembroke. Each of these establishments comprises covered slips on which the ships are built, docks in which they are kept, and all the appliances for rigging them out for sea. Boat-building and mast-making are also carried on; and in some, though not all of the yards, rope-making, sail-making, anchor-forging, block-making, and other manufacturing operations connected with the finishing and furnishing of ships. There are also arrangements connected with the storing of guns and other munitions of war. The yards at Plymouth, Gosport, and Deptford are limited to large establishments for victualing the navy; while, of the dock-yards proper, some have appliances for supplying seamen's clothing and necessaries; some for repairing steam-machinery for war steamers; one (at Chatham) for making most of the articles in copper and brass required by the navy. To enable our ships to be repaired and refitted abroad, there are royal dock-yards at Gibraltar, Malta, Halifax, Bermuda, Jamaica, the cape of Good Hope, Ascension, Trincomalee, and Hong-Kong. Since the creation of a steam-navy, and the large substitution of iron for wood in ship-building, an increasing proportion of the royal ships are built in private yards. All the dock-yards are under the admiralty, and each is governed by a distinct set of officers responsible only to that department. The chief officer, called the superintendent, is generally an admiral, but sometimes only a captain; and the office is deemed an honorable recognition of past services. The superintendent controls all the other officers, and all the artificers and laborers employed; examines the accounts, authorizes the payments, and is responsible for the stores. When a new ship is to be built, or other work executed, the superintendent receives general instructions from the admiralty, while special instructions are conveyed to other officers more immediately connected with the actual working. In yards were steam-machinery is repaired and fitted, engineers form an important part of the establishment. The artisans of the dock-yards comprise shipwrights, calkers, joiners, smiths, millwrights, block-makers, sail-makers, rope-makers, etc.; while under these is a large body of laborers.

In 1876–77, £1,323,750 was voted for the dock-yards at home and abroad, including £1,072,334 for wages of workmen and artisans. These charges are exclusive of all materials, and are for the dock-yards only, as distinguished from the victualing yard. The sum of £1,261,320 was voted for stores and materials for building and fitting out vessels for the fleet. Severe strictures have been made from time to time upon the management of our dock-yards. Several committees and commissions have been appointed to investigate the causes of defects, and to suggest remedies; and the reports issued on the subject have been from time to time laid before parliament.

DOCTOR (Lat. *docēre*, to teach), a teacher. Originally, the word doctor was used, in accordance with its etymological derivation, to signify a teacher in general, and it was not till the 12th c. that it became a title of honor for the learned, irrespective of the function of communicating knowledge. It had frequently appended to it, in those early days, some additional expression intended to characterize the peculiar gift of its possessor. Thus, Thomas Aquinas was called the Doctor Angelicus; Bonaventura, the Doctor Seraphicus; Alexander de Hales, the Doctor Irrefragabilis; Duns Scotus, the Doctor Subtilis; Roger Bacon, the Doctor Mirabilis; William Occam, the Doctor Singularis; Gregory of Rimini, the Doctor Authenticus; Joseph Gerson, the Doctor Christianissimus; Thomas Bradwardine, the Doctor Profundus; and the like. The word had long been used, even in the universities, as a general expression for a teacher before it came to designate a degree or rank in the learned hierarchy to which only the united body of the teachers could advance or promote the candidate. These formal promotions commenced at Bologna in the 12th c., and the learned Irnerius, the regenerator of the Roman law at that period, is said to have introduced the ceremonial which was afterwards universally adopted. Irnerius, however, is a sort of mythical hero in university history, and such statements with regard to him must be received with caution. See PROMOTION. The university of Paris almost immediately followed in the footsteps of Bologna, the first reception of doctors having taken place in the year 1145, in favor of Peter Lombard and Gilbert de la Porrée, the greatest theologians of the day. Subsequently to this period, the emperors were in use expressly to confer upon the universities the right of appointing doctors of laws by their authority and in their name. The example of the emperors was speedily followed by the popes, who conferred corresponding rights with reference to the canon law. From the 11th to the 13th c., there seems reason to believe that, both in Italy and France, the terms master and doctor were pretty nearly synonymous. In the German universities, the professors of theology were more commonly known as masters; and in the beginning of the 15th c., in accordance with the practice of the university of Prague, the distinction was pretty consistently made between doctors of law and medicine, and masters of theology and philosophy In modern times, the title of doctor has been applied almost everywhere to the three faculties of theology, law, and medicine. In Germany, it extends to that of philosophy, in which, in this country, the older title of master is still retained. The doctor's degree is, in general, conferred at the instance of the dean of the faculty to which it appertains. It is granted either on examination, and after the ancient form, at least, of publicly

defending a learned thesis in Latin has been observed, or else it is an honorary degree, conferred in consideration of the general reputation of the recipient for eminence in some particular branch of learning, philosophy, or science. See DEGREE. In Germany, the doctor ranks before the untitled nobility and next to the knight; and amongst themselves, doctors take the rank of the faculties to which they respectively belong, the first being theology, the second law, and the third medicine. In Oxford and Cambridge, and recently also in the German universities, doctors of music have been created. In the latter country, also, learned ladies have occasionally shared the honors of the doctorate. Dorothea Schlözer received the degree of doctor of philosophy from the university of Göttingen in 1787; Mariane Charlotte von Sieb[o]ld, that of medicine from Giessen in 1817; and Johanna Wittenbach, in philosophy, from Marburg in 1827. Of the four ancient degrees of bachelor (q.v.), master of arts (q.v.), licentiate (q.v.), and doctor, the modern university of France has retained only those of bachelor, licentiate, and doctor. Up to the period of the revolution, the highest consideration attached to the title of doctor of the sorbonne (q.v.)—that famous theological faculty, which was called "the perpetual council of the Gallican church," and of which the present faculty of theology of the academy of Paris is but a feeble and lifeless reproduction. But though the degrees of the sorbonne continued to enjoy, and apparently to merit, some degree of respect, such was by no means the case with those of the other schools of learning in France. Furettière, in his dictionary, defines a bachelor as a man who learns, and a doctor as a man who forgets. The ridicule of Voltaire, La Fontaine, Le Sage with his Doctor Sangrado, and Molière in the *Malade Imaginaire*, will readily occur to our readers as illustrating the position which was then held very generally by French doctors.

In England, the doctor's degree was not introduced into the universities till the reign of John or of Henry III. At first it was a very rare and highly prized honor, and the ceremony of conferring it was attended by scenes of feasting and revelry, of which curious accounts will be found in Antony à Wood's *History and Antiquities of the University of Oxford*. Colored engravings of the dresses worn by doctors of the several faculties at Oxford and Cambridge are given in Ackermann's histories of these universities. As to professional uses of the degree of doctor of civil law, see DOCTORS COMMONS.

DOCTORS COMMONS, formerly the college of the doctors of civil law in London, wherein the court of admiralty and the principal ecclesiastical courts were held. It was founded by Dr. Henry Harvey, dean of the arches, previous to which time the doctors had lived in Paternoster row. The original building was burned in the great fire in 1666, when the doctors removed for a time to Exeter house. After some time the commons was rebuilt, and the doctors returned to their former quarters. The courts which had been wont to hold their sittings at doctors commons are—the court of arches, the archdeacon's court, the prerogative court, the faculty court, the court of delegates, and the court of admiralty. The prerogative court is now amalgamated in the probate court (q.v.), and the court of delegates (q.v.) is transferred to the judicial committee of the privy council. At the time when these courts were all in full operation, their times of session were regulated by terms, as in the courts of equity and common law, a certain day in the week being assigned to each court for hearing its causes. The court of arches, the archdeacon's court, the faculty court, and the court of admiralty, have been changed, and no longer continue to exercise their functions in this once famous spot. The court of arches (so called from having sat in *Arcubus*, or under the arches or bows of Bow church, Cheapside) is the court of appeal belonging to the archbishop of Canterbury. The judge in this court is styled dean of the arches, and he has jurisdiction, as the archbishop's principal official, in all ecclesiastical causes within the province of Canterbury. He has original jurisdiction, also, in certain causes by *letters of request* (q.v.). It was by virtue of letters of request that matrimonial causes were tried in the court of arches; but this branch of its jurisdiction is now removed to the divorce court (q.v.). The archdeacon's court is an inferior court for the consideration of ecclesiastical questions occurring within the archdeaconry. For an account of the other courts mentioned in this article, see the several heads to which they refer. The practitioners in the several courts to which we have alluded were the doctors of civil law, called in the ecclesiastical courts advocates and proctors, who performed similar duties to those of attorneys or solicitors in the courts of law and equity. Both classes of practitioners required, in order to their admission to practice, to obtain the fiat of the archbishop, and afterwards to be duly admitted by the dean of the arches. The form of admission was in both cases attended with much ceremony. The doctor elect was introduced to the presiding judge by two doctors habited in their scarlet robes. The candidate then made a short Latin speech, and was admitted to practice in the courts. The habit of the doctors is a scarlet robe with a hood, trimmed with taffeta or white minever. The proctors were, in like manner, introduced by two senior proctors. In 1857, power was given by 20 and 21 Vict. c. 77, to dissolve the college of doctors commons and sell the property. The proctors received compensation, and all solicitors are allowed to act as proctors, and all proctors were turned into solicitors, all being alike solicitors of the supreme court, 21 and 22 Vict. cc. 95, 108; 23 and 24 Vict. c. 27; 33 and 34 Vict. c. 28, s. 30; 40 and 41 Vict. c. 25, s. 17. Nevertheless the old names continue, and will no doubt

only by degrees cease to be used in reference to ecclesiastical courts and proceedings. For a full account of doctors commons, see Stowe's *London*.

DOCTRINAIRE (a French term derived from doctrine) signifies, properly, the scientific taking up and exposition of a subject, as opposed to a treatment which is merely external, and which rests on accidental characteristics. In general, however, it is used as a term of reproach, to characterize views which are pedantic, schoolmasterly, and unpractical. In this sense it was applied in France, during the restoration, by the reactionary court-party to the fraction of the parliamentary opposition, who supported scientific doctrines of constitutional liberty against the arbitrary will of the monarch. This party, which had its rallying-point in the salons of the duc de Broglie, was led in the chamber by Royer Collard, and supported in the press and before the public by Guizot, and the younger members of what afterwards became the Orleans party. The development of the constitution on the basis of the *charte* of Louis XVIII., was the watchword of those men; but their real inspiration was derived from England. When the revolution of 1830 occurred, they became the advisers and ministers of the king of the French, and were more deeply imbued with the principles of constitutional monarchy than any other political party that has ever existed in France. The true fathers of the *doctrinaires* were Mounier, Lally Tollendal, Clermont Tonnerre, Talleyrand, and the abbé Montesquiou; and the cradle of the party was the original *comité* of the constitution, which, about twenty-five years before, elaborated the *charte* of 1814. Its later representatives found a center in the court of the exiled queen Marie Amalie at Claremont, and a vigorous supporter in her gifted son, the duc d'Aumale.

DOCTRINE. See DOGMA.

DOD, ALBERT BALDWIN, D.D.; 1805–45; son of Daniel; a graduate of Princeton, and tutor in the college 1827–29, and in 1830, chosen professor of mathematics. He lectured upon political economy and architecture, and wrote for the reviews and magazines of the period.

DOD, DANIEL, 1788–1823; b. Va., educated at Rutgers college, and especially devoted to the construction of steam machinery. He began when steam navigation was in its infancy, and soon became one of the most successful engine-builders in the country. He met his death in consequence of an explosion of a boiler on a steamboat in which he was experimenting on the East river, New York.

DODD, The Rev. WILLIAM, LL.D., was b. in 1729 at Bourne, in Lincolnshire; was educated, in the first place at a private school; and was admitted in 1745, as a sizar to Clare college, Cambridge, where after five years of study, he took his degree of B.A. Shortly after, he removed to London, received orders from the bishop of that city, and soon after gained a reputation as a popular preacher and as a successful littérateur. Through his celebrity as a divine and man of letters, and by means of flattering the great, he succeeded well in London, and in 1763 was appointed tutor to Philip Stanhope, the fifth earl of Chesterfield. His habits, however, were very expensive, and an income of £800 per annum, even when augmented by the produce of his literary labors, was not sufficient to supply his wants. This extravagance proved his ruin, as it tempted him to forge the signature of his former pupil, the earl of Chesterfield, to a bond for £4,200. For this crime he was arrested in Feb., 1777, and though he refunded the money, he was tried, convicted, and executed on the 27th of July. His writings are numerous and varied. His *Beauties of Shakespeare* (2 vols., Lond. 1753) is well known, as are also his *Reflections on Death* (1763), and *Thoughts on Death*, a poem composed during the time that intervened between his conviction and execution.

DODDER, *Cuscuta*, a genus of plants referred by some botanists to the natural order *convolvulaceæ*, and regarded by others as the type of a small distinct natural order *cuscutaceæ;* which differs from *convolvulaceæ* in the habit of the plants, leafless climbing parasites, with flowers in dense clusters; in having scales on the tube of the corolla alternate with its segments; and in having a spiral thread-like embryo, lying in a mass of fleshy albumen, whilst the cotyledons are so small that the embryo has been described as destitute of them. There are about 50 known species of *cuscutaceæ*, chiefly found in the warmer temperate parts of the globe. The name D. is often extended to all of them. One or two species of *cuscuta* are natives of Britain, parasitic on leguminous plants, heath, thyme, hops, nettles, etc. A species of D. is very injurious to crops of flax in Germany, and leguminous crops often suffer from this cause in the s. of Europe. The seed of D. germinates in the ground, but the stem soon seeks to attach itself to plants by little rootlets which it sends out, and the original root dies. The appearance of D. has been described as resembling "fine, closely tangled, wet catgut."

DODDER-LAURELS, *Cassythaceæ*, parasitic plants appearing generally like dodders, but in many respects resembling laurels. They grow only in hot regions, where they supplant the dodders. Only a single species is known in the United States.

DODDRIDGE, a co. in n.w. West Virginia, crossed by a division of the Baltimore and Ohio railroad; 300 sq.m.; pop. '70, 7,076—35 colored. The surface is hilly; chief business, agriculture. Co. seat, West Union.

in which trade he was very successful. In 1737, his *King and the Miller of Mansfield* was brought out at Drury Lane, and met with an enthusiastic reception. This was followed by *Sir John Cockle at Court; The Blind Beggar of Bethnal Green;* and *Rex et Pontifex*, which were republished in a collected edition of his dramatic works with the title of *Trifles* (1748). Meantime, he was conducting his business with such ability and spirit, that in the course of three years after commencement he was in a position to buy copyrights. In 1738, he bought Johnson's *London*, giving for it no more than ten guineas. His most successful work was a tragedy called *Cleone*, which was acted at Covent Garden with extraordinary success. On its publication, 2,000 copies were sold the first day, and within the year the work ran through four editions. With *Cleone* he closed his career of dramatic authorship. D. was connected either as contributor or publisher, and occasionally as both, with several magazines. He is, however, chiefly remembered now on account of his *Select Collection of Old Plays* (12 vols. 8vo, 1780); and his *Collection of Poems by several Hands* (4 vols. 12mo, 1748). Besides the volume entitled *Trifles*, another volume of his collected works was published in 1772 under the title of *Miscellanies*. He died in 1764.—See Knight's *Shadows of the Old Booksellers* (1865).

DODWELL, EDWARD, 1767–1832; an English antiquarian writer and draughtsman. From 1801 to 1806 he traveled in Greece, and spent the rest of his life for the most part in Naples and Rome. He wrote *A Classical and Topographical Tour through Greece*, and *Views and Descriptions of Cyclopean and Pelasgic Remains in Italy and Greece*, the last profusely illustrated. His widow, who was 30 years his junior, became the countess of Spaur, and was conspicuous, not only for beauty, but in the political life of Rome.

DODWELL, HENRY, 1641–1711; a native of Dublin, educated at a free school, and by the death of his parents reduced to great poverty. He became a fellow of Trinity college, and in 1688 was elected Camden professor of history at Oxford; but in 1691, he was deprived of his professorship for refusing to take the oath of allegiance to William and Mary. The remainder of his life was devoted to literary labors in chronology and ecclesiastical polity, and resulted in a number of valuable works. In religion, he was extreme, at one time promulgating the notion that immortality could be enjoyed only by those who had received baptism at the hands of one set of regularly ordained clergy, and was therefore a privilege from which dissenters were hopelessly excluded; again arguing from Scripture and the early fathers that the soul of man is naturally mortal, and gains continuance by only the special act of God. His son HENRY was the author of *Christianity not founded on Argument*, to which WILLIAM, another son, published a reply.

DOE, JOHN, the fictitious plaintiff in ejectment, whose services are dispensed with since the abolition of the fiction.—Wharton's *Law Lexicon*.

DOESBORGH (*Drususburgi*), a t. in the Netherlands, province of Gelderland, lies 11 m. e.n.e. from Arnhem, on the right bank of the Yssel. It was formerly fortified, but the walls have been broken down, planted with trees, and formed into pleasant promenades. An intrenched camp has been constructed on the n.e. side, between the Yssel and Old Yssel, which here unite. The streets are broad, and many of the houses handsome. There are several benevolent institutions, a grammar-school, boarding-school for boys and girls, and good public schools. The trade is considerable. Ship-building, book-printing, the making of eau de Cologne, preparing mustard, etc., are carried on. Pop. '77, 4,517.

DOFFER is that part of a carding-machine which takes the cotton from the cylinder when carded. See CARDING.

DOG, *Canis*, a genus of digitigrade (q.v.) carnivorous (q.v.) quadrupeds, which, as defined by Linnæus, included all that now form the family *canidæ* (q.v.), and also hyenas. In the genus as now restricted, wolves and jackals are generally included by naturalists, along with those animals to which alone the name dog is popularly applied, and a distinctive character of principal importance is found in the pupil of the eye, which is always round—contracting circularly, whilst in foxes it assumes the form of a section of a lens when contracted. The present article is limited to dogs in the common acceptation of the term, wolves and jackals being the subjects of separate articles; and only remarks relative to dogs in general will here find a place, many of the particular kinds being sufficiently important to be separately noticed.

At the very outset we encounter one of the most perplexing and difficult questions in natural history, as to the number of *species* of dog, and the origin of the domestic dog; two questions in appearance, but rather one in reality, and one on which the opinions of the most eminent naturalists are very much divided. According to some, all domestic dogs are to be regarded as of one species; and as in the case of some other valuable domestic animals, that species is not certainly known to exist in a truly wild state, all the wild dogs which must be admitted to belong to the same species being viewed as the offspring of domestic dogs which have returned to a wild state, and in which, however, it is supposed that the original type or characteristics of the species, modified by domestication, have in a great measure reappeared. According to others, there are numerous species of dog, originally distinct, which have been domesticated

by the inhabitants of different countries, but which, however, are very nearly related not only in their physical characters but in their dispositions and in some of their principal instincts, and which were capable of intermixing, not perhaps indiscriminately, but within certain limits, and so as to produce new races. By some who hold the first of these opinions, it is further maintained that the wolf and the dog are one species, and that all domestic dogs are derived from the wolf; whilst others advocate the claims of the jackal to be regarded as their original parent and type. By some of those who hold the species to be numerous, it is supposed not improbable that the blood of wolves and of jackals may be mixed in some of the domestic races with that of the original dogs. It is impossible for us to do more than state these different views, and a few of the principal arguments by which they are supported.

It is admitted on all hands, that there is great diversity among the different kinds of domestic dogs, many distinct races having long existed, which differ not only in size and other physical characters, but to a notable extent also in dispositions and instincts; it is further admitted that there appear to be no definite limits to the possible intermixture of these races with each other. So great is the diversity of physical characters, that naturalists of the greatest eminence almost acknowledge themselves incapable of pointing out any that are common to all dogs, and yet distinguish them all from the different species of wolves and jackals; and in fact, the *recurved tail*, not apparently a character of the first importance, is named by Cuvier himself as the most certain and unvarying specific distinction. The obliquity of the eyes of wolves is also contrasted with the more forward direction of those of dogs, which is accounted for—in favor of the theory of wolfish origin—by the supposition that it results from "the constant habit, for many successive generations, of looking forwards to their master, and obeying his voice."—Bell's *British Quadrupeds*. This, on the other side, is treated with ridicule; it is certainly a transition from the region of observation and ascertained fact to that of mere theory and conjecture. In size, dogs differ so widely that one is not as large as the head of another; the difference in form of body, head, or limbs, is almost equally great between the Newfoundland dog or the mastiff and the greyhound. The gradations, however, from one form or character to another, render it impossible to draw a fixed limit. In some races of dog, the hind-feet as well as the forefeet have five toes, instead of four, which is more common; but this has not been much insisted on as a ground of specific distinction. Greater value ought perhaps to be attached to the want in some, as the dholes (q.v.) of India, of the second tubercular tooth in the lower jaw; the hairiness of the soles of the feet of some is perhaps also not unimportant; and in favor of the opinion that domestic dogs have originated from an intermixture of several species, it has been urged that the number of teats in the female varies, and that there is sometimes even a difference between the number on one side and on the other, which has never been observed to be the case in wild dogs, and in them the number in the same kind is always uniform. Some of these points, however, have not received the investigation necessary to a confident determination of the measure of importance which ought to be assigned to them.

It seems to have been too hastily taken for granted, in favor of the opinion that there is only one species of dog, that all the wild races, even the dholes and the dingo, have sprung from domestic progenitors. There is certainly no evidence of this; and the fact that wild races exist, exhibiting marked diversities of character, in countries widely remote and of very different climates, is referred to with confidence on the other side, as affording at least a strong presumption in favor of the supposition that man has, in different countries, domesticated the species which he found there. We do not yet know enough of the amount and limits of the changes which circumstances and climate may produce, to warrant any confident conclusions on that ground. And if we were to adopt the views of those who ascribe least to such causes, we might yet demand them to show why, although from certain original types no mixed race can originate, there may not yet be other original types capable of such combination, or why the limits must be held equally impassable between all that were framed by an original act of creation. That there was only one original pair of the human race, may be held, without our of necessity holding that there was only one original pair of dogs. But to this consideration due place has, perhaps, scarcely been given.

That the common fox—or any species of fox—is a parent of any race of dogs, is not the opinion of any naturalist. Some dogs have a somewhat fox-like appearance, and indeed it is now generally admitted that the dog and fox will breed together, but as it has not been proved that the individuals of the cross will breed together, this fact does not warrant the assertion that the dog and fox belong to the same species. Instances of commixture between the dog and wolf have occurred in greater numbers, and without the compulsion of confinement, but in this case, too, the only recognized proof of identity of species—namely, the permanent fertility of the progeny—is wanting.

In favor of the specific identity of the dog and wolf, one of the strongest arguments is drawn from the equality of the period of gestation—63 days. But it may be remarked that an inequality of the period would have afforded a much stronger argument on the other side.

Against the identity of the dog and wolf, the difference of disposition has been strongly urged. In reply, it is shown by well-authenticated instances that the wolf is

very capable of that attachment to man which so remarkably characterizes the dog. There is greater value, perhaps, in the argument of col. Hamilton Smith, that "if domestic dogs were merely wolves modified by the influence of man's wants, surely the curs of Mohammedan states, refused domestic care, and only tolerated in Asiatic cities in the capacity of scavengers, would long since have resumed some of the characters of the wolf."

Buffon's notion, that the shepherd dog is the original type of the whole species, from which all dogs are derived, is merely fanciful, and his endeavor to support it by a comparative view of the different kinds, only exhibits a certain amount of ingenuity.

The shepherd's dog is one of the kinds of dog having greatest development of brain, but it is still greater in the spaniel. The skulls of dogs, however, neither exhibit very marked distinctions when compared with each other, nor when compared with those of wolves and jackals.

It is universally believed that the diversity of color exhibited by many dogs is a result of domestication, as it is neither found in those which may be supposed to exist in a state of original wildness, nor in those wild races which are certainly known to be the progeny of domestic dogs, a return to uniformity of coloring being apparently one of the most speedy consequences of a return to wildness. Black, reddish-brown, and white, the uniform colors observed in wild dogs, are, however, the colors which chiefly appear mixed in domestic races.

Pendulous ears are generally regarded as another result of domestication in dogs, as in rabbits; and it is certain that the wild races known have erect and pointed ears; but no wild race has been discovered at all corresponding to the mastiff in some of its other most notable characters, particularly the shortness of the muzzle, and depth of the chops, and it has therefore been conjectured that this and kindred races may have derived their origin from some wild dog of the interior of Asia, which has not yet come under the notice of any scientific observer.

The dog has been a domestic animal from a very early period. The earliest allusions to it are in the books of Moses, but they indeed correspond with the dislike and contempt still commonly entertained for it by many of the nations of southern Asia. By Homer, however, it is very differently mentioned; and "there is not a modern story of the kind which can surpass the affecting simplicity with which the poor dog's dying recognition of his long-lost master is related by one who wrote, probably, not less than 2,700 years ago." The sculptures of Nineveh, and the hieroglyphics of Egypt, attest the very early domestication of the dog, and the existence of races similar to some of those which exist at the present day; and the high value attached to it by many nations is further attested by the place assigned to it, or its image, as emblematic of the attributes which they ascribed to their gods. We do not now set so high a value on the dog, in consideration of mere usefulness to man, as on some of the other domestic animals; yet to the savage it is perhaps the most important of all, and some have supposed that by its aid the subjugation of other animals may have been first accomplished. Cuvier makes the strong assertion, that the dog "is the most complete, the most singular, and the most useful conquest ever made by man." The dog, far more than any other animal, becomes a humble friend and companion of man, often seeming actually to know and sympathize with the joys and sorrows of his master; and on this account it is, that he is alike "the pampered minion of royalty, and the half-starved partaker of the beggar's crust."

The uses to which the dog is applied are numerous, and correspond, in some measure, not only with distinct physical characters, but with remarkably distinct instincts of different breeds. Thus, whilst in some countries dogs are chiefly employed as beasts of draught, particularly for drawing sledges in the frozen regions of the north, and in other countries chiefly for the chase, the exquisite scent of some kinds, and the remarkable fleetness of others, variously recommending them for this use, we find them also rendering important services in the care of sheep and other cattle, and endowed with hereditary instincts wonderfully fitted for this purpose, and we find them, with like adaptation of instinct, highly valuable in watching and protecting the abodes and properties of their masters. Not the least interesting of the employments to which the dog has been devoted by man, is that of leading about the blind, which is often done with an intelligent and affectionate solicitude highly worthy of admiration.

Anecdotes illustrating not only the instincts, but the intelligence and affection of dogs, are familiar to every one, and form one of the most pleasing parts of many a book of natural history. Attractive to children, they are worthy of all the consideration which they can receive from the most philosophic mind. Volumes have been filled, and more volumes might easily be filled, with anecdotes well authenticated, and well worthy of preservation.

The dog produces usually from six to ten young ones at a birth. They are born blind, open their eyes about the tenth or twelfth day, attain their full growth in about two years, seldom live more than twelve or fifteen years, and almost never more than twenty.

No satisfactory classification of the different kinds of dog has ever been made. What some naturalists regard as types of species, others pronounce to be mere mongrel races. Nor can any principle of arrangement be found in form, roughness or smooth-

ness of fur, or other such character, which will not associate kinds that are in other respects widely dissimilar, and separate some that are nearly allied.

Col. Hamilton Smith arranges domestic dogs in six groups or sections: 1. "The wolf dogs," including the Siberian dog, Esquimaux dog, Iceland dog, Newfoundland dog, Nootka dog, sheep dog, great wolf dog, great St. Bernard dog, Pomeranian dog, etc. 2. "The watch and cattle dogs," including the German boar-hound, Danish dog, matin, dog of the North American Indians, etc. 3. "The greyhounds," including the Brinjaree dog, different kinds of greyhound, Irish hound, lurcher, Egyptian street dog, etc. 4. "The hounds," including the bloodhound, old southern hound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, water dog or poodle, etc. 5. "The cur dogs," including the terrier and its allies. 6. "The mastiffs," including different kinds of mastiff, the bull dog, pug dog, etc. Col. H. Smith does not include in any of these groups the dholes, dingo, etc., which he even separates from the genus *canis*.—Mr. Richardson arranges dogs in three great groups, "indicated by the least variable part of their osteological structure, cranial development." 1. Including the Irish wolf dog, highland deerhound, all kinds of greyhounds, and the tiger hound, characterized by *convergent* parietal bones, an elongated muzzle, and high and slender form. 2. Including the great Dane, the French matin, the pariah of India, the bloodhound, staghound, foxhound, harrier, beagle, pointers, terriers, turnspit, Newfoundland dog, Labrador dog, Pomeranian dog, Esquimaux dog, Siberian dog, Iceland dog, shepherd's dog, etc., characterized by *parallel* parietal bones, and generally by much acuteness of smell. 3. Including mastiffs, the great St. Bernard dog, bull dog, pug dog, etc., characterized by sensibly *divergent* parietal bones, bulk of body, robust structure, and combative propensities.

DOG (in law). The keeping of vicious or destructive dogs, or other animals, except under proper precautions, is illegal; and the proprietor is liable for the damage which they occasion in all cases in which it cannot be clearly shown that the fault lay with the party injured. Even before the injury occurs, it is competent to enforce measures of precaution. If a man have a dog which he knows to be of a savage nature, and addicted to bite, and he allow it to go in a frequented place without being muzzled or otherwise guarded so as to prevent it from committing injury, he may be indicted in England as for a common nuisance. If the dog be of a ferocious kind, as a mastiff, it has been held that he must be muzzled (1 Russ. 303); and it will be no defense in an action of damages against the master, that the person injured trod on the dog's toes, for he would not have trodden on them if they had not been there (3 Car. and P. 138). The harboring of a dog about one's premises, or allowing him to resort there, will warrant indictment (M'Hone and Wood, 5 C. and P. 2). If a dog known to his proprietor to have previously bitten a sheep, be retained by him, the proprietor will be liable to all subsequent injuries even to other animals, as, e.g., a *horse*. (Burn's *Justice of the Peace*, vol. ii. p. 333). In Scotland, a warrant may be obtained, on proof of vicious practices and danger to the public, either from the sheriff or the justices, on a summary complaint, to have a dog secured or slain, and the owner found liable in expenses. The complaint may be at the instance either of the fiscal or of a private party, with or without the fiscal's concurrence. An interdict may be granted against the D. going loose pending the discussion of the question as to whether or not he ought to be killed. Many local police acts contain provisions as to shutting up or muzzling dogs during the prevalence of weather likely to produce hydrophobia; and where such do not exist, the subject may be dealt with by the magistrate at common law. Formerly, the common law of England held that it was not larceny to steal any of the baser animals, in which class all dogs, except those of value, were included. But by 7 and 8 Geo. IV. c. 29, dog-stealing was declared to be an offense punishable by fine. This act was repealed, and new regulations of a more stringent kind made by 8 and 9 Vict. c. 47. By that enactment dog-stealing is a misdemeanor, punishable, on summary conviction, for the first offense, by six months' imprisonment and hard labor, or fine not exceeding £20 beyond the value of the dog. The second offense is an indictable one, punishable by fine or imprisonment and hard labor not exceeding eighteen months, or both. Similar punishment is provided for persons found in possession of dogs or dogs-skins, knowing them to have been stolen. A D. going into a neighbor's field does not afford ground for an action of trespass unless he does mischief; and even then the person who kills him in certain circumstances, may be liable in damages (3 Marsh. 584). The use of dogs for purposes of draught was prohibited under a penalty by 2 and 3 Vict. c. 47, which is explained by 17 and 18 Vict. c. 60, s. 2. See ANIMALS, CRUELTY TO.

Tax on Dogs.—The duty charged on every D. above the age of six months is 5*s.*, and shepherds' dogs are not exempt. Until recently, the duty on every D. was 12*s.* The maximum charge for any number of hounds was £39 12*s.*; of greyhounds, £9. Any D. kept wholly for the care of sheep or cattle, if not a greyhound, hound, pointer, setting-dog, spaniel, lurcher, or terrier, was exempt.

DOG'BANE, *Apocynum*, a genus of plants of the natural order *apocynaceæ*, having bell-shaped flowers, no style, and the fruit a long linear follicle. Some of the species are shrubby, some herbaceous; some extend into colder climates than is usual for plants of this order. The D. of North America (*A. androsæmifolium*), a perennial herbaceous

plant, about 4 ft. high, with smooth stem, much milky juice, smooth ovate leaves, and whitish rose-colored flowers, growing in open barren places from Georgia to Canada, is valued for the medicinal properties of the bark of its root, which is emetic, diaphoretic, and in small doses tonic. The root of CANADIAN HEMP (*A. cannabinum*), a plant noticed on another account in the article *Apocynaceæ*, possesses similar properties, and is frequently used in the United States.

DOG-DAYS. See CANICULAR DAYS.

DOG DISTEMPER, a kind of violent catarrh, common among dogs, especially when young, producing running at the eyes and nose, and a dry cough, followed by wasting of flesh and loss of strength, and sometimes by inflammation of the lungs and dysentery. The usual remedies are laxatives, emetics, and occasional bleeding. Astringents are useful in diarrhea, and fits may be modified by anodynes and warm baths.

DOG-DRAW. An apparent deprehension of an offender against venison in the forest. Dog-draw is where any man hath stricken or wounded a wild beast by shooting with a cross-bow, long-bow, or otherwise, and is found with a hound or other dog drawing after him to receive the same.—Cowel's *Interpreter*.

DOGE (equivalent to *duke*) was the name of the chief magistrate, possessing princely rank, in the republics of Venice and Genoa. Dogate or dogado, both from the Latin *ducatus*, duchy, is used to indicate the dignity of doge. We find doges of Venice elected by the people, but enjoying almost the rights of absolute monarchs, as early as the beginning of the 8th century. Their power, however was considerably reduced towards the end of the 12th c., through the creation of a great council, composed of 470 members, chosen from nobles as well as citizens, and invested with legislative power. These afterwards appointed six of their own number to superintend the D. in the exercise of his executive power. Further, the *pregadi*, or nobles, who formerly were admitted by the D. to a share in the public affairs, were organized into a regular board of administration, numbering 60 members. By the new constitution, the people, too, lost the most essential of their rights—viz., the right of electing the doge. This right was now changed into a privilege belonging exclusively to the great council, whose members elected 24 from among themselves, and these latter again elected, by ballot, 12 of their own number, upon whom devolved the right of appointing a doge. Sebastiano Ziani was the first D. thus elected, 1177; and on the occasion of his elevation to office, he scattered money among the people, to console them for the loss of their rights—an act which was imitated by his successors, and soon became a recognized custom, as was also the case regarding the manner in which he went through the ceremony of wedding the Adriatic sea. The pope Alexander III., whom, during his quarrels with the emperor Frederic I., the D. had faithfully supported, sent him, together with other privileges, a ring, as the symbol of domination the republic had acquired over the Adriatic. Accordingly, a marriage ceremony took place on Ascension day—a ring being thrown from the ship *Bucentaur* into the sea, to show that as the wife is subject to her husband, so is the Adriatic sea to the republic of Venice. The practical bearing of the ceremony soon appeared in the shape of stringent measures, regulating the navigation of the Adriatic, and imposing tribute upon all foreign ships. The power of the D. underwent, in 1179, a signal modification; the Treble Quarantia—a high court of justice, composed originally of 40 members—having been erected, as also the board of *advogadori*, for the settlement of fiscal questions instituted. During the reign of Jacopo Tiepolo, 1229–49, a new restriction arose from the creation of an independent police, and a still greater one from the formation of a tribunal consisting of three inquisitors and five correctors, who, on the demise of a D., had to examine his conduct, sifting the minutest particulars of his private life. All these changes were effected by the great council, to the thorough exclusion of the people. In 1268, the great council, in order to cut short all family influence upon the affairs of the state, devised a curious and extremely complicated mode of election; but notwithstanding the limitations new and old, the power of a D. continued great, if he was only wise enough to profit by the contentions between nobles and citizens, the disputes of the different authorities, and especially by his own position as commander-in-chief of the forces and high-admiral of the navy. This last prerogative of the D. remained in vigor up to 1628, when, by a formal enactment, the D. was prohibited the exercise of such command, unless he were authorized by the council of forty. Other privileges, however, belonging originally to the dogate, were abrogated or circumscribed long before this, and especially during the period 1289–1311. Thus, at the instigation of the D., Gradenigo, who was actuated by jealousy towards the mighty family Tiepolo, the famous law of "closing the great council" was passed, and by it the whole legislative and judicial power made the heirloom of those families whose names were inscribed in the Golden Book, or *Libro d'Oro*. About that time (1309), ecclesiastics of any degree were declared unfit for political or judicial functions. To counterbalance the influence of discontented nobles, a public feast was instituted—to come off yearly—at which the D. gave a dinner to the fishermen, fraternizing with them in testimony of equality. Shortly before Gradenigo's death, that terrible tribunal, the council of the ten, was erected, which was to be the highest in the state, irresponsible, and entitled to pass judgment upon the D. himself. In the meanwhile, the great council managed to get the functions,

public as well as private, of the D. circumscribed in the minutest way. It was ordered that the D. should not announce his accession, except to the princes of Italy; neither was he permitted the opening of dispatches emanating from the popes or from princes; the kissing of his hands, or kneeling down in his presence, was strictly interdicted. He could not leave town, be possessed of real property abroad, or allow his children to contract matrimonial connections with foreign houses, accept donations, etc. He had to submit to the continued presence of two *advogadori*, to be fined for the least mistake, and bear the expenses of the ducal dignity from his own purse. To all these restrictions and burdens the D. declared himself liable on the occasion of his coronation, by signing a document headed "Promissione." The state costume and retinue of the D. were minutely defined, and a trifle fixed as his salary. As a symbol of princely dignity, the D. wore a horned cap, and had the title of serenity. The credentials of ambassadors were written in his name, but signed by a secretary of state, and sealed with the arms of the republic. The money was struck in his name, but not with his stamp or arms. All the magistrates rose and saluted the D. when he came into council, and the D. rose to none but to foreign ambassadors. His family was exempt from the jurisdiction of the master of the ceremonies; and his children, though excluded from public offices, were allowed to have staff-officers, and gondoliers in livery. After the death of And. Dandolo, 1354, on a motion from the correctors, the three presidents of the quarantia, and later six ministers, were joined to the six privy-councilors of the D., who, together with the above-named, has formed henceforward the so-called Signoria Serenissima. At that stage the rank of D. could no longer be an object of ambition, and as early as 1339, a law was necessary to prohibit the D. elected from resigning his place. And. Contarini, 1367, accepted the proffered dignity only upon the threat of being declared a traitor to the country. In 1413, by a law emanating from the great council, the D. was even denied the title of Signoria, that of Messere being substituted instead; at the same time he was deprived of the right of convening an *arengo*, or meeting of the people. With the fall of the Venetian republic, 1797, the dignity of D. also disappeared. There were in all 73 D. at Venice, the first of whom, Anafeste (Paoluccio) was elected 697; the last, Manin (Lodovico), 1788. In the Palazzo Ducale, the celebrated frieze of the D. is to be seen round the Sala del Maggior Consiglie, exhibiting 72 portraits, and one space covered with a black veil, with an inscription, indicating that Faliero (Marino) was beheaded for high treason.

The republic of Genoa elected, after a victory gained by the party of the people (1339), Simon Boccanera for its first doge. He was elected for life, and with absolute power, of which, however, he allowed a share to 12 aldermen (*anziani*), the one half being chosen from the *cittadini* (citizens), the other among the *nobili* (nobles). In the long run of centuries, the power, duration, and splendor of the ducal seat underwent frequent changes, arising from the vicissitudes of the state and the hostilities between the popular and aristocratic parties. A constitution for defining the functions and prerogatives of the D. was framed in 1528, after the great victory of And. Doria over the French. According to this constitution, which, with slight modifications, remained till the end of the republic, the dignity of D. was of two years' duration, under restrictions similar to those at Venice. The candidate was to be a noble, and at least 50 years of age. The D. presided, with the right of veto, in the sittings of the great council, composed of 300 members, as also in those of a smaller one, consisting of 100. These two councils exercised the legislative power, whereas the executive was vested in the D., together with 12 *governadori* and eight *procuratori*, among these latter being always the D. retiring. During the time of his government, the D. resided in the state palace, where he was liable to the same restrictions and ceremonies which were in use at Venice. When, in 1797, Genoa was occupied by the French, the dogate ceased to exist; in 1802, the Genoese republic being, conjointly with the Ligurian, re-established, the ducal dignity was once more resuscitated; but in 1804, it disappeared forever, the republic itself having been dissolved.

DOGFISH, the popular name of some of the smaller species of shark; apparently owing its origin—like the names porbeagle, hound, etc., bestowed on others of the same family—to their habit of following their prey like dogs hunting in packs. Of the species to which the name D. is given on the British coasts, one of the most abundant is that sometimes called the common D. (*acanthias vulgaris*), also known as the picked (i.e., piked or spined) dogfish. It belongs to the family *spinacidæ*, of which one characteristic is the presence of a spine before each of the two dorsal fins; and which is further characterized by having spiracles or spout-holes; by having five gill-openings on each side all before the pectoral fins; and by having no anal fin, and no nictitating membrane of the eye. The body is long and tapering; the head flat; the snout conical; the teeth in both jaws sharp-edged, and formed for cutting. The tail-fin is longer than it is broad. The upper parts are slate-gray, the under parts yellowish-white; the skin very rough when rubbed from tail to head, but seeming quite smooth when rubbed in the contrary direction. This fish uses its spines in a remarkable manner, bending itself into the form of a bow, and unbending with a powerful spring; and "if a finger be placed on its head, it will strike it without piercing its own skin." It attains a length of 3 or 4 feet. It is very widely distributed, being found in the Atlantic, the Mediterranean, and

the South seas. It causes great annoyance to fishermen, by cutting the hooks from their lines, and still more by frightening away the shoals of herring, in which other kinds of D. share the blame with it. It sometimes appears in prodigious numbers; 20,000 have been taken in a net at one time on the coast of Cornwall; and the fishermen of the Orkneys and Hebrides sometimes load their boats to the water's edge with them. The flesh, although coarse, is dried and eaten; the livers yield oil, and the refuse parts are used as manure.—The other British dog-fishes belong to the genus *scyllium*, of the family *scylliidæ*, which have an anal fin, and two dorsal fins placed far back. They resemble in general form the species just described, and like it, they have the tail-fin longer than it is broad—they have five gill-openings on each side—the last of which, however, is over the base of the pectoral fin. They have spout-holes, and no nictitating membrane; but their teeth are very different, having a long central point, with shorter points on each side. The spotted D. of two species (*S. canicula* and *S. catulus*), both of a generally reddish-brown color, and marked with dark spots, is often taken with bait on all parts of the British coasts; and although almost never brought to market, is much used for food in the Orkney islands. It has been suggested that the fins of these and other sharks might be used for making gelatine soup, as in China.

DOG-FOX, a name sometimes given to certain small animals of the family *canidæ*, allied to the *corsac* (q.v.), and, like it, referred to the genus *cynalopex*. They have a sharp muzzle, not unlike that of a greyhound, rather large, erect, pointed ears, the pupil of the eye contracting circularly as in the dog, the tail bushy like that of a fox. They inhabit warm parts of Asia and Africa; and some, if not all of them, burrow.

DOGGER is a vessel something like a galliot or a ketch, used by the Dutch as a fishing-boat in the German ocean. It is not certain whether these were named after the Dogger-bank, or *vice versâ*.

DOGGERBANK, an extensive flat sand-bank in the middle of the German ocean, between England and Denmark, in lat. 54° 10′ to 57° 24′ n., and long. 1° to 6° 7′ east. It stretches 320 m. e.n.e., from 12 leagues e. of Flamborough head to within 20 leagues of Jutland. A prolongation runs e. towards Horn Point, Denmark. The bank is in some parts 60 m. broad, but the average breadth is 40. Towards the English coast, it is only 9 fathoms deep, in some parts it is 30, but the average depth is 15 to 20. The surrounding sea is in many parts 24 to 60 fathoms deep. The surface of the bank consists chiefly of fine sand and ooze. It is the seat of important English and Dutch cod-fisheries. At the s. end of D., in 1781, occurred the indecisive naval fight between the Dutch and English fleets, under admirals Zoutman and Parker respectively.

DOGGET'S COAT AND BADGE. These form a prize at a rowing-match on the Thames every year on the 1st of Aug. The prize is a bequest of Thomas Dogget, an actor of Drury Lane theater, who desired to signalize the accession of George I. to the throne (Aug. 1, 1715) by a prize of a waterman's coat and badge. Such is the account usually given; it would appear, however, from the following notice in the *Times* newspaper (Aug. 2, 1861), that there are several prizes rowed for on this occasion. "The first prize is a livery and badge given by Mr. Thomas Dogget, deceased, to which the Fishmongers' company add a guinea. The second and third prizes are respectively five eighths and three eighths of the interest on £260 17*s.* 3*d.*, formerly £200 South-Sea stock, left in the will of sir William Jolliffe, the amounts respectively being £4 17*s.* 9*d.* and £2 18*s.* 9*d.* The prize for the fourth man is £1 11*s.* 6*d.*, and for the fifth and sixth men each £1 1*s.*, the last three given by the company." Besides these prizes, additional sums are occasionally given by private individuals to the winner, or to the first, second, and third in the race. The competition is by six young watermen whose apprenticeships have expired the previous year; each being in a boat by himself, with short oars or sculls. The barge-master of the Fishmongers' company is ordinarily the umpire. The competition takes place when the current of the Thames, by recession of the tide, is strongest against the rowers; and the race, which is from London bridge to the Old Swan at Chelsea, always excites much local interest, being one of those manly sports in which the English take much pleasure.

DOG-GRASS. See COUCH-GRASS.

DOGLIA'NI, a t. of Piedmont, northern Italy, is situated in a mountainous district on the left bank of the Rea, 12 m. n.e. of Mondovi. D. has the remains of an old castle, but no other buildings worthy of note. Here five annual fairs are held, at which cattle, hemp, and victuals are chiefly sold. Pop. 2,000.

DOGMA (Gr.), meant originally an opinion or proposition, put in the form of a positive assertion, its truth being supposed to have been previously shown. In theology, it was understood to signify a doctrine founded on Scripture, and advanced not for discussion but for belief. But as this method of stating truth easily degenerates into the assertion of opinions without ground, and without regard to the aspect they may present to others, *dogma* and *dogmatism* have come in English to be almost synonymous with assertion without proof.

In continental theology, however, the word is still used without implying any censure, dogmas (Ger. *dogmen*) meaning simply doctrines; and this is the case in our own expression, dogmatic theology, or dogmatic, which is that branch of theology that treats

of the systematic arrangement of the doctrines of Christianity. Older names for the same thing were *Loci Theologici* and *Theologia Positiva*.—The first attempt to give a connected view of Christian doctrine was made in the 3d c. by Origen in his work *De Principiis*. He was followed in the 4th c. by Augustine, who in his book *De Doctrina Christiana*, and others, treated of the whole body of doctrine held by the church, though without any very scientific arrangement. The contributions to dogmatic, made in the 5th, 6th, and 7th centuries, were mere collections of "sentences." In the east, in the 8th c., the doctrines of the Greek church were treated by John of Damascus in a form already Aristotelian, and his work may be considered the first systematically-arranged treatise on dogmatic. He makes no mention of purgatory. His book was as influential in the Greek church as the writings of Augustine in the Latin. The regular systematizing of doctrines began with the SCHOLASTICS in the 11th c., but degenerated often into hair-splitting. The first cultivators of dogmatic theology among the Scholastics were Hildebert of Tours and Abelard, who were followed by Petrus Lombardus, Alexander de Hales, Thomas Aquinas, Duns Scotus, etc.

The era of the reformation awoke dogmatic to a new life, leading it back from Aristotle to Biblical theology. But the controversies between the different churches in the 17th c., and the too great importance attached to confessions of faith, cramped anew its freedom, and gave it again a Scholastic turn. Many of our still standard treatises on systematic divinity wear traces of these fetters, and contrast strikingly with the independence and vigor of inquiry displayed in the similar works of Melanchthon, Calvin, and other reformers. A fresh revival followed in Germany the spread of the critical philosophy of Kant, when Biblical theology rose up in contradistinction to the theology of confessions, and dogmatic was grounded on the critical interpretation of Scripture rather than on traditional formulas. Hence, however, have sprung widely diverging views. One party still held fast by the existing confessions; another looked chiefly to the contents of Scripture; while a third subjected confessions and Scripture alike to the test of reason. Besides these, there arose in more recent times, a school of dogmatic theologians, formed on the philosophical systems of Jacobi and Schelling, who looked for the essence of religion in the human soul itself, and considered Christianity as the historical revelation of it. Of this school, Schleiermacher, and in some respects Neander and Rothe also, may be considered the representatives; and of all the German schools, it is that which seems to be exercising the greatest influence on the speculative theology of Britain. An important contribution to this department of theology was Peter Lange's *Philosophische Dogmatik* (2 vols., Heidelb. 1849–51). The dogmatic of D. F. Strauss is constructed from the Hegelian point of view, and in its leading results comes back to the system of Spinoza.

It deserves remark that Christian dogmatic and morality, which it had been the custom to discuss separately since the 17th c., have recently been treated in combination by Nitsch and Beck. The scientific investigation of Christian doctrine in Germany has not been confined to the Protestant churches. A number of Catholic theologians have occupied themselves with this branch of sacred science; some, as G. Hermes of Bonn, inclining to freedom of investigation, and others, as Liebermann, to the defense of the usual formulas.

The HISTORY OF DOGMAS OR DOCTRINES has been raised in Germany to the rank of a distinct branch of sacred science. In this country, the facts with which it deals have received only passing notice in treatises on systematic theology, and in ecclesiastical history have been considered as the "internal history of the church." The pursuit of this branch of inquiry is characteristic of Protestantism; in the Catholic church it is considered as endangering the unity of the faith. Many Protestants even dislike the idea of a "development" of Christian doctrine, which seems to be involved in its having a history. It is not necessary, however, to believe that doctrines hitherto absolutely unknown or denied, came from time to time to be embodied in the orthodox creed of Christendom. See DEVELOPMENT. Though this may be denied, it remains an indisputable fact that the several doctrines came one after the other into prominence in the consciousness of the church; and that in each period of her history there is some one leading doctrine which assumed an importance, as if it were the mainstay of Christianity. To depict this succession or evolution of views with their struggles and modifications, and trace the different ways in which the several doctrines were at different periods formulated and embodied in the creeds, is the object of a history of doctrines (Ger. *Dogmengeschichte*). There is, of course, room for great variety in the method of treating such a subject. Among the most important works on this subject is Neander's, edited by J. L. Jacobi, 1856 (English trans. 1858), and that of F. C. Baur (1847), whose name marks an era in this branch of study.

DOGS, ISLE OF, or *Poplar Marshes*, a small peninsula in the co. of Middlesex, England, formed by a circuitous winding of the Thames, is situated in the vicinity of London, distant 3¼ m. e.s.e. from St. Paul's cathedral. It is about a mile long, and three-quarters of a mile broad. In what may be called the isthmus of the peninsula are situated the West India docks. It is said that the isle of Dogs derives its name from the circumstance that the king's hounds were formerly kept here.

DOGS. See ANDIRON.

DOG-SHORE. See LAUNCHING.

DOG'S-TAIL GRASS, *Cynosurus,* a genus of grasses having a pretty close spike or ear, each spikelet with two equal glumes and 3 to 5 florets, and beneath each spikelet a comb-like bract or involucre. The species, which are not very numerous, are chiefly natives of Europe and Asia. Two are found in Britain, but one only is common and valuable, the CRESTED D. G. (*C. cristatus*), which forms an important part of almost all good pastures, and is particularly esteemed for sheep pastures and lawns, for the improvement of which it is often sown. Its herbage is fine and close, and its deep roots secure it against droughts, which cause many other grasses to wither; but the herbage is not sufficient in quantity to make it desirable for hay. The comb-shaped bract connected with each spikelet of this common grass is a very interesting and beautiful object. The seeds are small, shining and yellow, whence the name gold-seed sometimes given to this grass by farmers.

DOGSTAR. See SIRIUS, *ante.*

DOG-WATCH, on shipboard there are two, usually from 4 to 6, and from 6 to 8 P. M.

DOGWOOD, or DOGBERRY, the name usually given to some of the arboreous and shrubby species of the genus *cornus.* See CORNEL. The common D. of Europe (*C. sanguinea*), a native of Britain and many parts of the continent, and also of the n. of Africa, is a shrub of 4 to 15 ft. in height, with ovate leaves, and terminal cymes of greenish-white flowers, which have an unpleasant odor. The leaves become of an intense dark-red color before they drop off in autumn. The wood makes the very best charcoal for gunpowder. It is very hard, and is made into skewers for butchers and cooks, and into cogs for wheels. The young wood was, in former times, in request for the making of arrows. The fruit, which is small, dark purple, and very bitter, yields an oil said to be equal to that of the olive, and to the amount of 34 per cent of its weight. This oil is used in France for lamps, and for the manufacture of soap. The D. of North America (*C. florida*) is a small tree, found in the United States, from lat. 43° to Florida, with oval leaves, and small yellowish flowers, which are surrounded by large white roundish bracts. The berries are red, and remain on the tree most of the winter. The flowers appear before the leaves, and their large white bracts are amongst the ornaments of the American woods in spring. The tree attains a height of 20 to 30 ft., with a trunk 8 or 10 in. in diameter. The wood is white, hard, fine-grained, much esteemed and used for inlaying and ornamental work. The bark is very successfully employed in the cure of intermittent fevers. It is also a valuable tonic. It is one of the most valuable medicinal products of North America. The barks of several other North American species of *cornus* possess similar properties. JAMAICA D. is *piscidia erythrina,* of the natural order *leguminosæ,* suborder *papilionaceæ,* a good timber-tree, with hard and resinous wood, which lasts well either in or out of water; the bark of the root powerfully narcotic, used for stupefying fish, and also for relieving toothache, being applied to the tooth in the form of a saturated tincture, or taken into the stomach as a powerful sudorific.

DOILEY, or DOILY, a small napkin used at table for putting glasses upon during dessert. Some are highly ornamented. The name is said to be derived from the original maker; but more probably it is a modification of the Dutch *dwaele,* a towel, and was introduced along with the article from Holland.

DOIT, a small copper coin current in Scotland during the reigns of the Stuarts. It was a Dutch coin (*duit*), and in value the 160th part of a guilder, which, estimated at 20*d.* sterling, would make the D. equal to the eighth of an English penny, or half a farthing. By some authorities it is said to have been worth only the twelfth of a penny; in reality, it is difficult to say what was its worth, for being imported, like many other coins of the period, from Holland, it would rise and fall in value according to the scarcity of money. The D. must have been common in the early part of the reign of James VI. The kirk-session of Perth (16th April, 1582) "ordains James Sym to give the witch in the tolbooth 8 doits in the day" for subsistence.

DOKKUM, a t. in the Netherlands, province of Friesland, lies 12 m. n.e. from Leeuwarden, on the Ee (pronounced *Ay*), which cuts it into two irregular parts. Within the town is a broad haven, suited both for sea-going and inland ships. There are several regularly built streets and many neat houses. The trade in flax, cattle, wool, and chickory is extensive. In the Dokkummerdiep, shrimps are largely taken. Ship-building, gin-distilling, beer-brewing, carding wool, etc., are principal industries. There are a grammar and other good schools. Pop. '77, 4,538.

DO'KOS, a race of blacks in Africa, s. of Abyssinia, almost dwarfs in size. They are in a wild state, and are the favorite prey of slave-stealers.

DOLABEL'LA, PUBLIUS CORNELIUS, b. about 70 B.C.; a Roman gen. of violent and wicked character, often involved in criminal acts, from which he was extricated by Cicero. When 30 years old he drove away his wife Fabia, and married Tullia, Cicero's daughter, against the father's consent. Being heavily in debt he fled from Rome to Cæsar's camp, and took part in the battle of Pharsalus. Returning to Rome, he gained immunity from his debts by securing for himself an election as tribune, and his first legislative act was to propose a law canceling all debts. He was so troublesome in Rome that, to remove him, Cæsar made him a gen. in Africa. Dolabella was ambi-

tious to be consul, and Cæsar promised him the office; but Antony's opposition delayed the fulfillment, and before it could be arranged, Cæsar was murdered. Dolabella at once seized the insignia of office, made friends with the assassins, and was confirmed in the office which he had usurped. He threw down an altar erected to Cæsar, and crucified those who would offer sacrifices upon it. Antony sent him in command of an expedition against the Parthians, where his cruelty and rapacity added infamy to a name already infamous. He tortured Trebonius at Smyrna for two days to force him to disclose the hiding-place of his treasures, and then murdered him. Hearing of this, the senate outlawed Dolabella, and sent Cassius to take his place. Having no further hope of power, Dolabella caused one of his own soldiers to kill him, 43 B.C.

DOLA'BRA, a rude ancient hatchet. They are represented on the columns of Trajan and Antoninus, and abound in all museums. When made of flint, which was their earliest and rudest form, they are usually called *celts* (q.v.).

DOLCÉ, an Italian term in music, meaning softly and with tenderness

DOL'CE, LUDOVICO, or LUIGI, 1508-68; an Italian author, and a voluminous writer. He translated almost anything and everything from the Greek and Latin, and wrote original works, in all 70 in number. The best known is *Marianna*, a tragedy from the life of Herod, reproduced in French by Voltaire, and still on the stage. He also wrote the lives of Charles V. and Ferdinand I., many other dramas, and miscellaneous works.

DOLCI, CARLO, or CARLINO, a celebrated painter of the Florentine school, was b. at Florence in 1616. He received his first instructions in art from Jacopo Vignali, a pupil of Roselli, and a remarkably skillful teacher. After an uneventful life spent entirely in his native city, D. died Jan. 17, 1686. His works, which consist chiefly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character. D.'s drawing is generally correct, his coloring exquisitely delicate and transparent, and in the nicety and laborious care of his finish he approaches the most characteristic examples of the Dutch school. His works are numerous, and scattered over all Europe. Besides his madonnas, the most famous are his "St. Cecilia," "Christ Blessing the Bread and Wine," "Herodias with the Head of John the Baptist," and "Christ on the Mount of Olives."

DOL'CINITES, or DULCINISTS, a sect established in Italy in the 13th c.; they were opposed to the popes, and their doctrines were similar in many respects to those of the spiritual Franciscans. In 1307, Dolcino, the founder of the sect, with some of his followers, was burned at the stake.

DOLE (Lat. *dolus*, guile), in Scotland, the amount of conscious guilt or evil intention which is necessary to make a legal crime. A person incapable of consent is also incapable of dole—*doli incapax*, as it is technically called. The corresponding phrase in England is *felonious intent*.

DÔLE, a well-built t. of France, in the department of Jura, 28 m. s.e. of Dijon. It is delightfully situated on a vineyard slope rising from the right bank of the river Doubs, and the environs are tastefully laid out in gardens and promenades. The principal building is an immense cathedral, named, in honor of the Virgin, *Nôtre Dame*. The chief manufactures of D. are hosiery, tiles, pottery, chemical products, and beer; there are also iron-smelting furnaces, flour-mills, and some trade in corn, wine, wood, marble, and iron. Pop. '76, 12,009. D. is the *Dola Sequanorum* of the Romans, of whose presence the ruins of two aqueducts, an amphitheater, several temples, and the "street" or road which passed from Lyon through D. to the Rhine, still give indications. There are also the remains of a castle built by Frederick Barbarossa in the 12th century. D. is likewise memorable for having sustained several sieges.

DOLE-FISH seems to be that fish which fishermen employed in the north seas do of custom receive for their allowance, 35 Hen. VIII. c. 7.

DOLES AT FUNERALS; these are of great antiquity. St. Chrysostom speaks of them as being given to procure rest to the soul of the deceased. On this ground, as well as on the score of general benevolence, the practice of making gifts to the poor at funerals was common until comparatively recent times; for it was continued, sometimes on a munificent scale, long after the custom of praying for the dead had been abandoned on the introduction of reformed doctrines. Nichols, in his *History of Leicestershire*, speaking of Strathern in Framland Hundred, observes of this usage: "In 1790, there were 432 inhabitants, the number taken by the last person who carried about bread, which was given for *dole* at a funeral; a custom formerly common throughout this part of England, though now fallen much into disuse. The practice was sometimes to bequeath it by will; but, whether so specified or not, the ceremony was seldom omitted. On such occasions, a small loaf was sent to every person, without any distinction of age or circumstances, and not to receive it was a mark of particular disrespect." These doles, whether in money or in articles of food and ale, were at one time common not only in England, but in Wales, Ireland, and Scotland; and the custom may be said to have represented, in a simple state of society, that form of benevolence which, in the present

day, consists of bequests to hospitals and other public charities. By some writers, the custom of making doles at funerals is traced to the sin-offering of the Hebrews. See Brand's *Popular Antiquities*, edited by Ellis.

DOLET, ÉTIENNE, 1506–46; a French writer and printer, said to have been an illegitimate son of Francis I. In 1537, he obtained a privilege for ten years to print any works of his own or which had received his supervision. His liberality of sentiment was manifest from his press issues, which ranged from the New Testament in Latin to Rabelais in French. This liberality brought upon him the persecution of the Roman Catholic church, and after long watching he was arrested as a relapsed atheist, put to the torture, and burnt to death; the alleged cause being his insertion in Plato's *Axiochus* of the words "Nothing at all," implying a denial of the immortality of the soul; and yet Plato's book more exactly and positively makes that denial. Dolet was an earnest advocate for the circulation of the Scriptures in the common language of the people.

DOLGELLEY ("dale of hazels"), the capital of Merioneth, North Wales, near the center of the co., and the largest town in it, is situated on the banks of the Wnion, 208 m. n.w. by w. of London. It lies in a rich and picturesque valley, at the foot of Cader Idris, and during the summer months is much frequented by English and foreign tourists. It has manufactures of coarse woolens and flannels; its Welsh tweed is in great repute and demand throughout the kingdom; lamb and kid skins are tanned and dressed; and in the vicinity there are fulling-mills and bleach-greens. Pop. '71, 2,217. Here, in 1404, Owen Glendwr held a parliament, and signed a treaty of alliance with Charles, king of France.

DOL'ICHOS, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, closely allied to *phaseolus* (see KIDNEY BEAN), and chiefly distinguished by the extension of the base of the standard so as to embrace the wings of the corolla at their base. The genus includes a considerable number of species, some of them shrubby, some annual, and some perennial herbaceous plants. Some of them have beautiful flowers, and some of the herbaceous species are cultivated on account of their seeds, which afford a kind of pulse; or of their young pods, which, like those of the kidney bean, are boiled for the table. Among these are *D. lablab*, a native of India and Egypt (which has been made the type of a separate genus, *lablab*); *D. Nankinicus* (or *lablab Nankinicus*) a Chinese species; *D. lubia*, a native of Egypt; *D. sesquipedalis*, a native of America; *D. soya* or *soja hispida* (the soy bean), *D. catiang*, and *D. uniflorus* (horse gram), natives of India: *D. sphaerospermus* (calavana or black-eyed pea), a native of the West Indies. In the climate of Britain, even the most hardy kinds require the aid of a little artificial heat, and they are reckoned inferior to other kinds of pulse or garden vegetables of easier cultivation. The well-known Chinese sauce or ketchup called soy (q.v.) is made from the soy bean. Allied to D. is the genus *canavalia*, to which belong the SWORD BEANS of India. *C. gladiata*, the commonly cultivated species, has pods 2 ft. long. Another allied genius is *psophocarpus*. The seeds of *p. tetragonolobus*, formerly *D. tetragonolobus*, are used in the Mauritius as peas are in Britain; and its pods and tuberous roots are common Indian esculents. Some species of *pachyrhizus*, also an allied genus, are remarkable for their tuberous roots, as *p. angulatus* (formerly *D. bulbosus*), a native of India, now cultivated in South America and other warm countries, which produces pleasant turnip-like tubers; and *P. trilobus*, which has tubers 2 ft. long and nearly cylindrical, much used as a boiled vegetable in China and Cochin-China.

DOLICOCEPH'ALIC, long-headed, a designation of human skulls which have the diameter from front to back much greater than the transverse diameter. Such are the heads of certain Australian and West African races. The opposite conformation is called *brachycephalic*, or short-headed.

DOLI'NA, a t. of Austrian Galicia, in the circle of Stryi, 60 m. s. from Stryi, on an affluent of the Swica. It has extensive salt-mines. Pop. of town and commune about 7,000.

DO'LIUM, a genus of gastropod mollusks having shells spirally furrowed, resembling the hoops on a cask. More than a dozen species are found in the warm seas of the east, and seven fossils are known.

DOLL, an imitative baby used as a toy by girls. The word doll is of doubtful derivation; possibly from *idol;* in French, the name is *poupée;* in German, *puppe*, from Lat. *pupa*, a girl, a doll. The use of dolls dates from the most remote times, and is common in all countries, barbarous as well as civilized, because it springs from that love of nursing and fondling infants which is implanted by nature in the female character. Precisely as a child in a princely mansion in England fondles a finely dressed doll worth a guinea, so does the child of an African or Esquimaux take delight in a piece of wood or bone carved rudely in the form of a baby—in fact, girls in the humbler ranks may sometimes be seen hugging and talking to a bit of stick decorated with a few rags, as if it were a live child. This is not the place to discuss this curious psychological phenomenon; it is enough to say that the love of dolls is a perfectly legitimate feeling, and its exercise helps to cultivate not only tender affections, but taste as regards the making and management of children's dresses. Accordingly, the keeping of a doll becomes a

part of the home education of girls; and is recognized to be so by the universality of the practice.

As in the case of most other toys (q.v.), dolls were at one time imported into Great Britain chiefly from the Netherlands; and hence not an unusual name for a doll was a Flanders baby. These old Flemish or Dutch dolls were made of wood, with neatly formed faces and flashy dresses, the cheaper kinds having slender wooden legs. Latterly, there have been great improvements in the making of dolls, and in England it has assumed the character of a manufacture; but there are still large importations from the countries on the Rhine, France, and Switzerland. In these continental countries, women and children are mostly engaged in the manufacture. Some carve the heads and bodies, others paint the faces and necks, others prepare legs and arms, and a different class cut out, sew, and put on the dresses. These operations are seldom executed in one manufactory. Usually, dealers buy the fragments so far prepared by villagers, and get them put together in a wholesale way. As the time employed in the preparatory processes is scarcely of any marketable value, the prices of fragments are most insignificant. Hence, as regards all the cheap kinds, with painted faces and ringlets, dolls can be imported at a cost below that at which they could be executed by hand-labor in England. When, however, we come to dolls of a superior kind, with molded wax or composition faces, arms and feet, glass eyes, stuffed bodies, flaxen ringlets, and gauze dresses, the English, by their machinery and capital, carry off the trade. In London there is a considerable number of doll-makers, manufacturing dolls of wax, gutta-percha, india-rubber, etc. In this as in other trades, there is an economic division of labor; there are dolls' head-makers, dolls' leg and arm makers, doll sewers, doll stuffers, dolls' wig-makers, dolls' eye-makers, and doll dressers. For some dresses, remnants of calico, gauze, silk, and other materials, are procured from shops; but for fashionably dressed dolls, much in demand, it is necessary to buy goods on a large scale. The extent to which doll's glass-eyes are manufactured appears surprising. Some years ago, in evidence before a committee of the house of commons, a glass-manufacturer at Birmingham stated that he had received, at one time, an order for £500 worth of dolls' eyes. The cheaper dolls' eyes are simply small hollow glass-beads, made of white enamel, and colored with black or blue, but without any attempt at variety or effect; while those eyes of a higher quality have a ring of color to represent the iris. The introduction of wires and mechanism to make the eyes move or wink at pleasure, and also to cause the doll to utter the sounds "papa" and "mamma," have been highly appreciated steps in advance, with a corresponding rise in prices. It is stated in the experience of the trade, that since Victoria came to the throne, blue eyes for dolls have been in the ascendant in England; but that black eyes find the best market on the continent, especially for Spanish dolls. Black dolls are made for export to America, where they are in request by girls of negro parentage, and the introduction of gutta-percha is favorable for this branch of the trade. Composition-heads are usually made of *papier maché*, cast in a mold, and waxed and painted to represent the features.

One of the most attractive stalls at the great exhibition in 1851, was that which contained the dolls of Mme. Montanari, a London manufacturer. Referring to this stall, the jury report said: "It consists of a series of dolls, representing all ages, from infancy to womanhood, arranged in several family groups, with suitable and elegant model furniture. These dolls have the hair, eyelashes, and eyelids separately inserted in the wax, and are, in other respects, modeled with life-like truthfulness. Much skill is also evinced in the variety of expression which is given to these figures, in regard to the ages and stations which they are intended to represent." Some of those dolls were sold at five guineas undressed; and at a greatly increased price when richly attired. The same exhibition showed how much skill is now exercised in making rag-dolls, in which almost every part is formed of textile materials.

DOLLAR is the name of a coin, and the unit in the monetary system, of the United States. The origin of the name deserves notice. *Dollar* is a variety of the Ger. *thaler*, Low Ger. *dahler*, Dan. *daler;* and the word came to signify a coin thus: About the end of the 15th c., the counts of Schlick coined the silver extracted from their mines at Joachims-thal (Joachim's valley) into ounce-pieces, which received the name of Joachims-thaler—the Ger. adjective from the name of the place ("Joachims-dalers," as it were). These coins gained such a reputation, that they became a kind of pattern; and others of the same kind, though made in other places, took the name, only dropping the first part of the word for shortness. The American dollar is taken from the old Spanish dollar or piastre, and is only slightly less. It was formerly only of silver; but in 1873 the gold dollar was made the unit of value in the United States. In 1878, however, silver was "remonetized," and so now shares with gold the rank of standard money. Since 1837, the silver dollar is required to contain 412½ troy grains, or 26.4246 Fr. grammes, the fineness of which is fixed at $\frac{9}{10}$, i.e., $\frac{1}{10}$ of it is alloy. In the standard silver of Great Britain, $\frac{1}{12}$ is alloy. The United States dollar is generally estimated in exchange at 4*s.* 2*d.* sterling. Besides dollars, there are coined in silver, *half-dollars*, *quarter-dollars*, *dimes* ($\frac{1}{10}$ dol.), *half-dimes* ($\frac{1}{20}$ dol.), and three-cent pieces. With regard to these, it was enacted in 1853, that the weight of the half-dollar shall be 192 grains, and that of the others proportional to this; and that such silver coins shall be legal ten-

ders for all sums not exceeding five dollars. Accounts are kept in dollars and cents, or hundredths of a dollar, which are written thus: $13.78—thirteen dollars and seventy-eight cents. The standard gold of the United States is of the same fineness as the silver —namely, $\frac{9}{10}$; and of this are coined double-eagles, eagles, half-eagles, and quarter-eagles; of 20, 10, 5, and 2½ dollars, besides three-dollar and one-dollar pieces. The dollar or thaler in Germany had various values. That of Prussia, which was most current, was equivalent to 3*s.* sterling.

DOLLAR, a village in Clackmannanshire, on the right bank of the Devon, 10 m. e.n.e. of Stirling. It lies in a plain under the Ochills (q.v.). Coal and iron occur in the vicinity. D. is noted for its academy, founded in 1818 under the will of capt. M'Nab, a native of the parish, who bequeathed £80,000 for the purpose. The academy was incorporated by act of parliament in 1847, and has a principal and 19 teachers in the classics, arts, modern languages, etc. The minister and kirk-session of D. were the original patrons and governors, but in 1847 the trust was extended so as to include the lord-lieutenant, vice-lieutenant, convener, and sheriff of the county, the principal of the university of Edinburgh, county gentlemen, two members of the presbytery of Stirling, and two representatives appointed by the parliamentary electors of Dollar. Pop. '71, 2,123. The principal industrial feature of D. are its many famous bleacheries on the banks of the Devon. A mile n. of D. are the fine ruins of castle Campbell, in a wild romantic situation, on the top of a high almost insulated rock, in a hollow in the bosom of the Ochills, amid mountain rivulets and bosky woods. It long belonged to the Argyle family. John Knox is said to have resided in the castle under the protection of Archibald, fourth earl of Argyle, the first Scotch noble to embrace Protestantism publicly.

DOLLART, THE, a gulf of the German ocean, at the mouth of the river Ems, between Hanover and Holland. It is about 10 m. in length by 7 in breadth, and was formed by inundations of the sea, the first of which took place in the latter half of the 13th c., and the last in the 16th century. By these watery inroads a large number of villages were submerged, and thousands of persons perished.

DÖLLINGER, JOHN J. IGNATIUS VON, one of the most distinguished of the Roman Catholic divines of modern Germany, was b. at Bamberg, Feb. 28, 1799. He was educated at Würzburg, where he received holy orders. For a time he was engaged in parochial duties in his native diocese; but having manifested a peculiar fitness for a literary life, he was appointed a professor at Aschaffenburg, whence, in 1826, he was removed to the chair of ecclesiastical history in the newly established university of Munich. From the first he was distinguished as a ready and profound writer. He inaugurated his new professorial career by a work on *The Doctrine of the Eucharist during the First Three Centuries*, in 1826, and a *History of the Reformation*, being a continuation of Hertig's *Handbook of Church History*. He subsequently undertook a new *History of the Church* (vol. i. 1833, vol. ii. 1835), which was speedily translated into French, and also into English, and was carried down to the 15th c.; with a compendium which came down to the reformation (1836–43). His very learned and suggestive essay on *The History, Character, and Influence of Islamism* appeared in 1838, and *The Reformation, its Internal Development and Effects*, in 3 vols., in 1846–48. The design of this work, which consists almost entirely of extracts (connected by a very slight thread of narrative) from the writings of the leading reformers and other contemporary Protestant divines, is to present in the words of the actors in the great religious drama of the 16th c., a picture, doctrinal, moral, social, and political, of the reformation and its results; but as the great body of the authorities (exclusively Protestant) are German, the interest of the work is mainly national.

For a time, D. undertook the chair of dogmatic theology, in which capacity he delivered lectures on "The philosophy of Religion," on "Symbolism," and on "Patristic Literature," none of which, however, have been published. He was a frequent contributor to the *Historisch-politische Blätter;* he published several pamphlets on subjects of occasional interest; and was one of the chief contributors to the Catholic cyclopædia, entitled *Kirchen-Lexicon*, in which his articles on Luther, on Bossuet, and on Duns Scotus attracted much attention. In the politico-religious movement of 1846–47, D. was elected to represent the university of Munich in the Bavarian chamber; but being deprived of his professorship, he became disqualified to sit in the chamber. In the parliament of Frankfort, in 1848, he was recognized as the leader of the Catholic party. Most of the measures of importance bearing on the relations of church and state which (however ineffectively) were originated in that assembly were prepared or suggested by him. In 1849, he was restored to his professorship at Munich, and also to his place in the Bavarian chamber, which he held till 1852. Since that year, he has devoted himself entirely to theological literature. His work entitled *Hippolytus und Kallistus* (1853) is a masterpiece of patristic criticism; and his *Heathenism and Judaism, the Vestibule of the History of Christianity*, is a most masterly survey of the religious, moral, and social condition of the world at the advent of our Lord. It was quickly followed by *The First Ages of Christianity*, to which it had been designed as an introduction. During the early discussions on Italian unity, D. delivered an address at Munich, which was represented as hostile to the temporal sovereignty of the pope. In order to explain his real

opinions on that important question, D. published, in 1861, an elaborate work entitled *The Church and the Churches*, which was partly a comparative survey of the condition of the non-Catholic communions, and of the church, and partly a *résumé* of the history and condition of the papal states; showing that, while the temporal sovereignty was the means providentially established for maintaining the spiritual independence of the papacy, yet it was by mo means essential; that the papacy long existed without it, and that even if it were overthrown, Providence would devise another means of attaining the same end. The second part was a criticism of the administration of the papal states, which is understood to have given dissatisfaction to the authorities, as being, although well meant, inopportune, and from this inopportuneness, unfriendly. A similar feeling is said to have been drawn forth by the part taken by Dr. D. in reference to the "Catholic union," some of the principles of which were supposed to trench dangerously upon the province of authority in matters of religious inquiry; but his orthodoxy and learning were unquestioned, and his influence, especially among Catholics of his own nationality, was very great until the approach of the time for the celebration of the council of the Vatican. It being understood that the doctrine of the infallibility of the pope would form a subject of discussion, D. took an active part in organizing an opposition. Articles which appeared in the *Augsburg Gazette*, in Mar., 1869, and which were reprinted more fully under the *nom de plume* "Janus," were ascribed to him or to his influence; and during the discussions of the council, he was entirely identified with the party opposed to the Ultramontane view. On the publication of the decree of the council, which defined the infallibility of the pope in all doctrinal teachings on faith and morals addressed *ex cathedra* to the universal church, D. refused to accept the doctrine. In Oct., and in depreciation of the impending censure of excommunication by the archbishop of Munich, he published an address to the archbishop, in which he claimed to be heard in the synod of German bishops, or before a committee of the cathedral chapter. His declaration on papal infallibility called forth replies from Dr. Hergenröther and others, and was accepted, on the other hand, by the so-called old Catholic party. D. was elected rector of the university of Munich (Feb. 29, 1817) by a large majority of votes. Persisting in his refusal to submit to the authority of the council, he was excommunicated by the archbishop of Munich on the 18th of April, 1871. In 1874, Dr. D. presided over the "old Catholic conference" at Bonn, where he frankly declared that he and his colleagues did not consider themselves bound by the council of Trent. He also introduced a declaration, adopted unanimously, that the eucharistic celebration in the church is not a continuous repetition or renewal of the great propitiatory sacrifice. His literary activity is little diminished. In relation to the prophecy of Orval, and other French prophecies supposed to bear upon the late war with Germany, he published recently an elaborate essay on *Prophecies and the Prophetical Spirit*, which has been translated into English by Alfred Plummer. In addition to his accomplishments in book-learning, Dr. D.'s attainments as a linguist, both in ancient and modern languages, are very remarkable. In 1871, D. received the honorary degree of D.C.L. from Oxford university; and in 1872, that of LL.D. from Edinburgh. In 1872, the king of Bavaria conferred on him the order of merit; and in 1874, the emperor of Germany the order of the red eagle, second class. In 1873, he was appointed president of the royal academy of science at Munich.

DOLLOND, JOHN, a distinguished optician, inventor of the achromatic telescope, was descended from a French refugee family, and b. in London, June 10, 1706. His father was an operative silk-weaver, in humble circumstances, and D. was also brought up to that occupation. Engaged at the loom all day, he devoted great part of the night to his favorite studies of mathematics, optics, and astronomy. Not content with these, he turned his attention to the most varied subjects, made himself acquainted with anatomy, and even theology, and went so far in the study of the classical languages as to translate the Greek Testament into Latin. French, German, and Italian also, he knew well. He apprenticed his eldest son, Peter, to an optician; and after the latter had established himself in business on his own account, he was joined by his father in 1752. John D. now devoted himself to the improvement of the dioptric telescope, in which he was encouraged by the most distinguished scientific men of the time. After a series of well-contrived experiments and researches, carried on for several years, he succeeded in constructing lenses that produced images without any colored fringe. See ACHROMATIC. This was undoubtedly the greatest improvement that the telescope had received since its first invention. The memoir (published in the *Philosophical Transactions* for 1758) in which he gave an account of his investigations, was rewarded by the council of the royal society with the Copley medal. In 1761, D. was elected a fellow of the royal society; his death took place on the 30th of Nov. of the same year. His two sons continued to carry on the business with great reputation and success.

DOLLY SHOP, the name popularly given in London to a shop where rags and other kinds of old articles are bought, and over the door of which a black doll is usually suspended. It is understood that dolly shops are in many instances a kind of unlicensed pawnbroking concerns. For small articles a few pence are given, on the understanding that the seller can buy them back at an advance some days after. In Edinburgh and

Glasgow, shops of this kind are known as *wee pawns*, and give some concern to magistrates and police.

DOLMEN, the name given in France to what British archæologists call a cromlech (q.v.). The dolmen, properly so called, consists of *one* large unhewn stone resting on two or more unhewn stones placed erect in the earth. But the name is sometimes applied to structures where several blocks are raised upon pillars, so as to form a sort of gallery. One of the most remarkable monuments of this kind is the *Pierre Couvert*, about a mile and a half from Saumur. It is 64 ft. long, about 15 ft. wide, and about 6 ft. high. It has four stones on each side, four on the top, and one at each end. The stone at the e. end has fallen down; all the others appear to be as they were originally placed. Some of them are of great size, one on the roof measuring 24 ft. in length, and more than 2 ft. in thickness. All are of the sandstone of the neighborhood. The floor is unpaved. Dolmen is believed to be a Celtic word, signifying a stone table. The monuments to which the name is given are supposed to be the sepulchers of the ancient Celts or Gauls.

DO'LO, a t. of northern Italy, in the government of Venice, and 12 m. w. from Venice, on the Brenta and Bretano. It is a station on the railroad between Padua and Venice. In the vicinity are many villages of the Venetian nobility. Pop. 4,468.

DOLOMIEU, DÉODAT-GUI-SYLVAIN-TANCRÈDE GRATET DE, 1750–1801; a French geologist and mineralogist. He was one of the knights of Malta when a boy, and fought a duel with and killed a brother knight, for which he was condemned to death, but was saved in consequence of his youth. He then turned his attention to science, and visited Spain, Sicily, and the Pyrenees. He minutely described the earthquake in Calabria in 1783, and in later years studied the Alps, where he discovered the mineral "Dolomite," which is named after him. He became professor in the school of mines and a member of the institute from its formation. In 1798, he was on the scientific staff of Bonaparte's expedition to Egypt. Here he lost his health, and on the way home was left at Messina, where he was an object of political hatred because he had revealed to the grand master of Malta the designs of the Neapolitans against that island. He was confined in a wretched dungeon, clothed in rags, and given only a bed of straw. There he was kept 21 months. Denied writing materials, he made a pen from a piece of wood, and with the smoke of his lamp for ink, wrote on the margins of his Bible—the only book he possessed—his *Traité de Philosophie Minéralogique*, and *Memoire sur l'Espèce Minerale*. At the conclusion of the treaty between France and Naples, he was released, and took the chair of mineralogy in Paris, made vacant by the death of Daubenton.

DO'LOMITE, BITTER SPAR, or MAGNESIAN LIMESTONE, a mineral consisting of carbonate of lime and carbonate of magnesia in somewhat variable proportions, sometimes nearly equal, the carbonate of lime often greatly preponderating; and usually containing also a little—sometimes nearly 20 per cent—of carbonate of iron. It is softer than limestone; usually white; sometimes gray, yellow, or brown; and occurs compact, cellular, or porous, granular, foliated, and crystallized. Its crystals are usually rhomboidal, and its cleavage is rhomboidal. It is readily distinguished from limestone by its feeble effervescence in acids. It occasionally occurs in veins, accompanied with quartz, calcareous spar, etc., but also as a rock, and forms mountain masses. It is often used as a building stone; the new houses of parliament are built of it. It is also burned and made into mortar, but the lime obtained from it remains much longer caustic than lime from common limestone; and if spread on land in the same quantity, impairs rather than increases the fertility of the soil.—*Brown spar* (q.v.) is a variety of dolomite.

DOLOMITE MOUNTAINS. The distinctive peculiarities of dolomite mountain scenery may be seen on the grandest scale in the s.e. of Tyrol and in the Carinthian Alp masses. When the dolomites *par excellence* are spoken of, it is the D. M. of this region that are meant.

DOLPHIN, *Delphinus*, a genus of *cetacea*, the type of a family, *delphinidæ*, which is characterized by a moderate size of head—differing in this from the *catodontidæ* or *physeteridæ* (see CACHOLOT)—and usually by having numerous simple and conical or nearly conical teeth in both jaws, although some of the species lose those of the upper jaw at an early age. The blow-hole is single. The family *delphinidæ* includes, along with the dolphins, porpoises, grampus, etc., many animals, which on account of their larger size are very commonly called *whales*, as the beluga or white whale, the caaing whale, the bottlehead, etc. It contains also a few species, which inhabit, not the ocean, but tropical and sub-tropical rivers, as the soosoo of the Ganges and the *inia* of the Amazon. The true dolphins have the snout prolonged into a rather slender beak, which is not only abruptly separated from the convex forehead, but even by a marked furrow. Both jaws are furnished with numerous equal teeth. The species are numerous, most of them recently discovered, and none of them apparently having the very wide geographical range formerly ascribed to the common D. (*D. delphis*), with which they were confounded. They are very voracious animals, and are said to prey not only on fishes, medusæ, cephalopods, etc., but even on the wounded and feeble of their own species. They live, however, in herds, which often delight the voyager in the ocean solitude by the gambols which they perform around his ship. "They may be discerned at a great distance; as they are con-

tinually leaping from the surface of the sea, an action which, as it seems to have no obvious object, is probably the mere exuberance of animal mirth. When a shoal is seen thus frolicking at the distance of a mile or two, in a few moments, having caught sight of the ship, down they come trooping with the velocity of the wind. When arrived, they display their agility in a thousand graceful motions, now leaping with curved bodies many feet into the air, then darting through a wave with incredible velocity, leaving a slender wake of whitening foam under the water; now the thin back-fin only is exposed, cutting the surface like a knife; then the broad and muscular tail is elevated as the animal plunges perpendicularly down into the depth, or dives beneath the keel to explore the opposite side.

The common D. is found in the Mediterranean and in the northern Atlantic ocean. It is usually not more than 6 or 8 ft. long, but individuals have been seen of 10 feet. The body tapers towards the tail. The tail is crescent-shaped, and about a foot in breadth. The beak is about 6 in. long. The blow-hole is crescent-shaped, with the horns directed backwards. The color is blackish on the back, grayish on the sides, and a satiny glistening white beneath. The female D. brings forth a single young one at a time, which she suckles and nurses with great care. Although an inhabitant of the ocean, the D. emits a peculiar murmuring or suppressed lowing cry. The flesh of the D. was formerly considered a delicacy, and sailors still regard the capture of one as a happy event.

From the form of its beak, the D. receives from the French the names of *bec d'oie* (goose-beak) and *oie de mer* (goose of the sea). It was very differently regarded and designated by the ancient Greeks: it was their *hieros ichthys* (sacred fish), was invested with many fabulous attributes, and was the subject of many mythological legends. It was supposed to be peculiarly friendly to men. It was sacred to Apollo, who was worshiped at Delphi with dolphins for his symbols. The figure of the D. appears on many ancient coins and medals: it is said to have been borne on the shield of Ulysses; it early appeared on the shield of some of the princes of France, and gave its name to one of the fairest of the French provinces, from which the heir-apparent of the French throne came to be styled the dauphin. It is not easy to account for the high regard in which the D. was anciently held; nor is it altogether easy to explain the very general transference of its name in modern times to the coryphene, a very different creature, remarkable for those changes of color in its dying moments which poets have delighted to celebrate.

Of the other species of D. one only occurs, and that but rarely, in the British seas, the bottle-nosed D. (*D. tursio*), which is said sometimes to attain a length of 24 feet. It appears to belong to the northern parts of the world.

Dolphins not unfrequently enter the mouths of rivers. A D. of the Arctic ocean (*D. leucas*) ascends into the fresh water of the Obi, to prey upon the ascending fishes of various kinds.

DOLPHIN, Black, *Aphis fabæ*, a species of *aphis* (q.v.), or plant-louse, which infests the bean, and often does considerable injury to crops, sucking the juices of the plants and preventing the development of flower-buds. It is of a dull, black, or dark-green color, the young spotted with silvery white. The first that appear are all wingless, but by and by winged individuals are produced, and the pest spreads with great rapidity. It is in the succulent tops of the plants that the aphides first appear, and a common practice of gardeners is to remove the tops in which they are observed.

DOM, or Don (from Lat. *dominus*, lord). This title was originally assumed by the popes, from whom it descended, in France at least, to bishops and other dignitaries, and finally to monks. In Portugal, the title *dom* is confined to the sovereign and his family. The Spanish *don* was originally confined to the nobility, but is now bestowed by courtesy as indiscriminately as the English *Mr.* or *gentleman*. The feminine *doña* is, in like manner, given to ladies.

DOMAIN. See Demesne, *ante*.

DOMAT, or DAUMAT, Jean, 1625-96; a French writer, known chiefly from his elaborate digest entitled *Lois Civiles dans leur Ordre Naturel Suivies du Droit Publique*, for which Louis XIV. settled upon him a pension of 2,000 livres. The work was published in English in 1722, and has passed through several editions.

DOM-BOC, or Doom-book (book of dooms or sentences, *liber judicialis*), the code of laws compiled by king Alfred, chiefly from the west-Saxon collection of his own ancestor Ina, but comprising also many portions of the Kentish collection of Ethelbert, with the supplements of his successors, and of the Mercian laws of Offa. "Ina's collection," says Dr. Pauli, "was the only one received entire into the Codex, which was chiefly applicable to the condition of the west Saxons. A few articles were admitted here and there from the Kentish and Mercian laws, but research into this matter is not possible, as Offa's book is lost." Alfred made few if any original laws, but contented himself with restoring, renovating, and improving those which he found already in existence. The west-Saxon dialect had become a written language earlier than any of the Teutonic dialects of the continent; and as the power of the clergy in Saxon England

was of a more limited kind than elsewhere, the laws of England, up to the period of the Norman conquest, were administered in the vernacular speech of the people. Alfred's peculiarly Christian character is strongly impressed on his code, which begins with extracts from the Bible, "The Lord spake all these words, saying, I am the Lord thy God." Then follow the ten commandments, the part of the Mosaic law relating to criminal offenses, and passages from the New Testament, including the golden rule. Yet it should be observed, that these extracts prove not the *ecclesiastical*, but only the *scriptural* character of the *dom-boc*. The code was ratified by the Witan, as Alfred expressly informs us. In addition to Dr. Pauli's life of Alfred, now published in two English translations, the reader is referred, for information on this subject, to Thorpe's Introduction to Alfred's Laws, in the *Ancient Laws and Institutes of England*, i. p. 58.

DOMBROW'SKI (properly DĄBROWSKI), JAN HENRYK, a distinguished Polish gen., was b. 29th Aug., 1755, at Pierszowice, in the district of Cracow. He entered the service of the elector of Saxony in 1770; but in 1792, on the first symptoms of the insurrection in Poland, proceeded to Warsaw. He took part in the Polish campaigns against Russia and Prussia, and exhibited such remarkable military talent, that on the termination of hostilities, Suwarrow offered him employment in the Russian service, and Prussia made him a similar offer. Both were refused, and D. went to France, where, in 1796, he was commissioned by the directory to form a Polish legion among his exiled countrymen, of which he was appointed commander. The legion brilliantly distinguished itself in the Italian campaign. While in Rome, the admirable discipline which D. preserved among his troops, raised him so high in the estimation of the senate, that it presented him with the standards which his great countryman Sobieski had taken from the Turks, when he compelled them to raise the siege of Vienna, and which he had sent to the church of San Loretto. In the campaign of 1799–1800, D. gave splendid proofs of his courage. After the peace of Amiens, D. became a gen. of division in the service of the Cisalpine republic; and after the battle of Jena, along with Wybicki, he was ordered by Napoleon (1806) to summon his countrymen to arms. His entrance into Warsaw, at the head of 12 Polish divisions, resembled a classical "triumph." At Dirschau and Friedland, he won fresh laurels. In the fatal Russian campaign of 1812, he commanded one of the three divisions of the fifth *corps d'armée*, and at the passage of the Beresina, saved from destruction the relics of Poniatowski's corps. In 1813, at the head of his Poles, he took an honorable part in the battles of Teltow, Grossbeeren, Jüterbogk, and Leipsic. After the fall of Napoleon, D. returned to Poland, and in 1815 was appointed by the emperor Alexander a gen. of cavalry and Polish senator; but in the following year he withdrew from public employment to his estate in the duchy of Posen. He died 6th June, 1818.

DOME (Ital. *duomo*). Though often used synonymously with cupola (q.v.), a dome, in the stricter sense which it has obtained in the languages of northern Europe, signifies the external part of the spherical or polygonal roof, of which the cupola (*cupo*, or cup) is the internal part. In Italian usage, however, it has a wider signification than even the first, being used to denote the cathedral or chief church of a town, *the house* (domus) *par excellence*, or house of God. The cause of the name of the building being thus applied to the form of the roof which covered it, arose from the fact, that the chief churches of Italy were at one period almost universally so roofed. In tracing the historical origin of the D., we are usually in the habit of regarding it as originating with the architecture of the eastern empire, because it was at Constantinople and in the Byzantine provinces that it was first employed in ecclesiastical structures. But it was the Romans who, in reality, were the inventors of the D., as of all the other applications of the semicircular arch. Of their success in applying it to large buildings, we have abundant proof in the ancient domes still to be seen in Rome and its neighborhood. The D. of the Pantheon is still probably the most magnificent D. in existence, and others of smaller size are to be seen in the temples of Bacchus, Vesta, Romulus, Hercules, etc. "From Rome it went to Constantinople, and from the same source, also, came the few insignificant attempts at domes in the western empire."—Fergusson's *Handbook of Architecture*, ii. 943. The external form of the D. of the church of St. Sophia at Constantinople, which became the typical Christian structure of the kind, will be seen in the illustration appended to BYZANTINE ARCHITECTURE. See PANTHEON. The D. of San Vitale, at Ravenna (q.v.), is said to be still more ancient than that of San Sophia, and is a very remarkable structure of the same class. On the church of St. Marco, at Venice, there are no less than five domes, the center one, as is usual, being much larger than the others. The interior of these domes is covered with mosaic (q.v.). So far from being peculiar to the few churches we have mentioned, domes occur in the churches of almost every town along the western shore of the Adriatic, and form, in fact, the chief architectural feature of this side of Italy. The construction of domes in modern times was revived in Rome, by the building of that of Our Lady of Loretto in 1507. But the three most celebrated modern domes are those of St. Peter's (q.v.) at Rome, of St. Paul's (q.v.) in London, and of the Pantheon (q.v.) in Paris. A very complete article on domes, which has been condensed in the *Penny Cyclopædia*, will be found in the *Encyclopédie Méthodique*, under "Architecture."

DOMENICHI'NO, or **DOMENI'CO**, ZAMPIERI, a celebrated painter of the Bolognese school, was b. in Bologna, 1581. He began his studies under D. Calvaert, and completed them under the Caracci. During the whole of his career, D. had much to suffer from the jealousy of rivals, who are not free from the suspicion of having caused his death by poison, 1641. His frescos are distinguished by correctness of design, soft delicacy, and freshness of color; the heads of his figures, in particular, are remarkable for expressive force. The masterpiece of D., the "Communion of St. Jerome" (in the Vatican), though suggested by Ag. Caracci's, is a sublime production. The "Life of the Blessed Virgin," and the "Cure of the Demoniac Boy," are of exquisite beauty. Out of Italy, the museum of the Louvre possesses the largest number of D.'s works.

DOMESDAY BOOK, or DOOMSDAY BOOK, the name of one of the oldest and most valuable records of England, containing the results of a statistical survey of that country made by William the conqueror, and completed in the year 1086. The origin of the name—which seems to have been given to other records of the same kind—is somewhat uncertain; but it has obvious reference to the supreme authority of the book in doom or judgment on the matters contained in it. It was anciently known by several other names, such as the *Liber de Wintonia*, or Book of Winchester; and the *Rotulus Wintonia*, or Roll of Winchester, because it was at one time preserved in the royal treasury in that city; the *Liber Regis*, or the King's Book; the *Scriptura Thesauri Regis*, or Record of the King's Treasury (where it was long kept, together with the king's seal, under three locks and keys); the *Liber Censualis Angliæ*, or Rate-book of England.

The way in which the survey was made will be best described in the words of the contemporary writer in the *Anglo-Saxon Chronicle*. After relating how, in the year 1085, England was threatened with invasion from Denmark and Flanders, and how king William prepared for its defense by laying waste the sea-shores, and by raising the largest army that had ever been seen in the island, "billeting the soldiers upon his subjects, every man according to the land which he possessed," the annalist goes on to say that at midwinter, when the king was at Gloucester, "he had a great consultation, and spoke very deeply with his witan [i.e., great council or parliament] concerning this land, how it was held, and what were its tenantry. He then sent his men all over England, into every shire, and caused them to ascertain how many hundred hydes of land it contained, and what lands the king had in it, what cattle there were in the several counties, and how much revenue he ought to get yearly from each. He also caused them to write down how much land belonged to his archbishops, to his bishops, his abbots, and his earls, and—that I may be brief—what property every inhabitant of all England possessed in land or in cattle, and how much money this was worth. So very straitly did he cause the survey to be made, that there was not a single hyde, nor a yardland of ground, nor—it is shameful to say what he thought no shame to do—was there an ox, or a cow, or a pig passed by, and that was not set down in the accounts, and then all these writings were brought to him."

The survey was made by commissioners called the king's justiciaries, who seem to have had the help of the chief men of every shire. By a sworn assize or jury of the sheriffs, lords of manors, presbyters of churches, reeves [i.e., grieves or overseers] of hundreds, bailiffs, and six villeins [i.e., tenants at will] of every village, they made inquest as to the name of the place; who held it in the time of king Edward (1041–66); who was its present possessor; how many hydes there were in the manor; how many homagers or vassals; how many villeins; how many cottars; how many serfs; what plowgates in demesne [i.e., reserved in the lord's own hand]; how many freemen; how many tenants in socage [i.e., tenants by hereditary right]; how much wood; how much meadow and pasture; what mills and fish-ponds; how much had been added or taken away; what was the gross value in king Edward's time; what was the present value; and how much each free-man or soc-man has or had. Of all this there was to be a threefold return or valuation: 1. As the land was held in king Edward's days; 2. As it had been given by king William; 3. As it stood at the time when the survey was made; and the jurors were to say further whether the value could now be raised.

The returns thus gathered in the several shires, and their hundreds and other subdivisions, were arranged and digested in the record which is now called the Great or Exchequer Domesday. The enumeration of the cattle and swine, which so moved the indignation of the Anglo-Saxon chronicler, was omitted from the record, doubtless because the live-stock was altering every month and year, so that an account of its numbers in any one year could not be of permanent importance; but that the enumeration was made, is proved by the records called Little Domesday and the Exon Domesday. These are believed to be transcripts of the original rolls or returns made by the conqueror's commissioners for the counties of Essex, Norfolk, Suffolk, Wilts, Dorset, Somerset, Devon, and Cornwall; and they set forth the number of horses, oxen, sheep, goats, and pigs, together with some other details left out in the compilation of the Great Domesday. The taxes were levied according to the divisions of the country given in the D. B., until 1522, when a new survey, popularly called the *New D. B.*, was made.

The mere statement which has been made of its contents, is enough to show the immense value of D. B. for all purposes of inquiry into the ancient condition of England. "It will ever," says Dr. Lappenberg, "be found an inexhaustible source

of information respecting the Anglo-Saxon and Norman constitutions, particularly the rights and revenues of the kings and their vassals, the relations of cities and towns, statistic accounts of various kinds, families and their landed members, together with innumerable matters highly interesting to inquiring posterity, but unnoticed by the chroniclers of those times, either as too well known or as worthless. An intimate acquaintance with Domesday should supply the basis of every historical account of England, particularly of its special history during the middle age." No other country of Europe can show such a work. It was fit, therefore, that it should have been the first great English record published at the national cost. It appeared in 1783 in two folios, being printed with types cast for the purpose, so as to represent the contractions of the original manuscript, and having been ten years in passing through the press. In 1816, two supplementary volumes were published, the one containing an excellent general introduction, by sir Henry Ellis of the British museum, with indices of the names of places and of the tenants in chief mentioned in the work; the other containing four other records of the same nature: 1. The Exon Domesday, already mentioned; 2. The Inquisitio Eliensis, a record closely resembling the Exeter Domesday, containing the survey of the lands of the monastery of Ely, in the counties of Cambridge, Hertford, Essex, Norfolk, Suffolk, and Huntingdon; 3. The Winton Domesday, containing two surveys of the city of Winchester, one made between 1107 and 1128, the other in 1148; and, 4. The Boldon Book, a survey of the possessions of the see of Durham, made in 1183. This last work is especially valuable, as partially supplying a deficiency in the survey for D. B., which did not extend to the counties of Durham, Northumberland, Westmoreland, and Cumberland, either, it would seem, because they had been lately laid waste by the conqueror, or because his dominion was not fully established in them. A new and better edition of the Boldon Book was issued in 1852 by the Surtees society, which, in 1857, printed *Bishop Hatfield's Survey*, another record of the possessions of the see of Durham, compiled between 1345 and 1381. A new and enlarged edition of sir Henry Ellis's *General Introduction to Domesday Book*, was published in 1833, in 2 vols. 8vo. See also Stubb's *Select Charters*, and Freeman's *Norman Conquest* (vol. v., 1876). In 1861, a fac-simile copy of that part of D. B. which relates to Cornwall, was published by the ordnance survey, as an example of what can be done by the new process of engraving called photozincography. This experiment proving successful, government has gone on publishing the rest of the D. B., county by county, in the same way. In 1872, government ordered a general return of owners of lands, to be prepared by the local government board. This new "Domesday Book" was published in 1874–76.

DOMESTIC ANIMALS are those which, in order to turn them to his use, man has tamed or reduced in a greater or less measure from their natural wildness, and which he makes the objects of his care, and in a living state his property. Many animals are useful to man, which he has never thus appropriated. Such are the deer and other game which the hunter pursues, and fishes generally, whether of the sea, lake, or river. Man has not yet found it possible to domesticate them, or has not found it necessary or desirable to do so. Individuals, indeed, of some species may have been domesticated, and become very tame, but these are exceptional instances. In general, those only are called domestic animals which have existed from one generation to another in a state of domestication. Of almost all of them, domesticated races exist, considerably different from any that are now found in a state of nature; the peculiar circumstances in which they are placed by domestication exercising a modifying influence, like that of cultivation in plants. Domestic animals mostly belong to the classes of mammals and birds. Of mammals, those which have been domesticated are exclusively of the common quadruped form, and mostly herbivorous. The greatest number, and these among the most important, belong to the order of ruminants; some of them being valuable for their flesh, their milk, their hair or wool, their hide, etc., or as beasts of burden and of draught, some even on all these accounts. To this order belong the ox, buffalo, and yak, the sheep, the goat, the reindeer, the camel, and the llama and alpaca. Of other herbivorous quadrupeds, the most important are the horse and ass, the elephant and the hog. Of the elephant, however, although for many ages it has been much employed for various purposes in India, no domesticated race exists; the individuals which man reduces to his service being still taken as at first from among the wild denizens of the forest. Domesticated races exist of two comparatively unimportant quadrupeds of the order of rodents, the rabbit and the cavy or Guinea-pig.—Of carnivorous quadrupeds, there are only two which have been generally and thoroughly domesticated, the dog and the cat. The uses to which these animals are destined are very different from those in order to which herbivorous quadrupeds are kept in a domestic state. Analogous to one of the uses of the dog is that to which the cheetah or hunting-leopard is applied by some of the princes of India, but, like the elephant, it is only individually domesticated. The same remark may be made concerning some other animals—the otter, the civet, etc.—which in different countries are tamed or kept in confinement to meet certain purposes for which man finds it convenient to employ them. The domestication of the ferret is rather more complete.—Of birds, the most important domestic species belong to the gallinaceous order, and to the family *anatidæ* among web-footed birds. To the former belong the common domestic fowl, the turkey, the

peacock, the Guinea-fowl, etc.; to the latter, the goose, duck, etc Of other birds, none can be said to be truly domesticated, except, perhaps, one or two species of song-birds, particularly the canary. The birds used in falconry are domesticated only in the same sense as the cheetah; but it is not uninteresting to observe that man has been able to make both birds and beasts of prey his servants.—Reptiles are quite capable of being tamed, and in some countries some of them are occasionally kept in houses for killing flies, or even for killing mice and rats; but none of them can be enumerated among domestic animals. Nor, perhaps, can any species of fish be so regarded, although artificial ponds have long been in use, and some species of fresh-water fish are to a certain extent the objects of care and of a kind of culture on the part of man.—In the lower divisions of the animal kingdom, only a few species ever receive such culture, or in their living state are claimed by man as his property. All these belong to the class of insects—viz., two or three species of bee, two or three species of silk-worm moth, and two or three species of cochineal insect. These may perhaps more fitly be described as *cultivated* than as *domesticated*.

Many animals not yet domesticated might probably be added with advantage to the number of domestic animals. Adaptation to particular climates and situations might probably be found to recommend species allied to those in which great part of the wealth of mankind has long consisted, and from which still more of it has been derived. It is not impossible, also, that as the waste places of the world become peopled, animals already becoming scarce may be advantageously domesticated on account of their fur or other products for which they are now pursued by the hunter.—The principal domestic animals, however, of the present day have been domestic animals, and highly valued as such, from time immemorial. We have no record of the domestication of the ox, the horse, the camel, the dog, etc. Even the llama and alpaca, although known only to the inhabitants of the Andes and adjacent regions, were found in a state of domestication there when South America was first visited by Europeans, and their subjection to man is probably to be referred to the earliest periods of Peruvian civilization. The limitation of some domestic animals to particular countries and climates—of which we have notable instances in the camel of the Asiatic deserts, the reindeer of the arctic regions, the yak of the steep and snow-clad Himalaya, the buffalo of tropical marshes, and the South American quadrupeds just mentioned—forbid us to suppose that all the important domestic animals were domesticated by the same people and at the same period, or that they have all spread in a state of domestication from a common center or source. Yet there are many circumstances which point to the same Asiatic region as that in which the greater number of them were first domesticated, which is commonly regarded as the cradle of the arts and sciences, and even of the human race.

DOMESTIC ARCHITECTURE. The external forms and internal arrangements of the domestic abodes of a people are far more influenced by their manners, habits, and occupations, and by the climate in which they live, than their ecclesiastical edifices and public buildings; and there is, consequently, no department of architecture which is so varied and national as domestic architecture. But not only are the circumstances of each country different in this respect—the same is the case with every department of each country, with every town in each department, with every street in each town; and a D. A. which fulfills its object, will not only adapt itself to the necessities, but will make the best, in point of artistic effect, of the specialties of every case with which it is called upon to deal. The circumstances of families, and even the tastes and fancies of individuals, are legitimate subjects of consideration in domestic architecture. To attempt to give to D. A. the beauty of uniformity, is consequently to mistake both its object and the source from which its charm is derived. When attained at all, uniformity is attained not in accordance with, but in defiance of, the utilitarian objects of domestic architecture. The results of this artistic falsehood may be seen in the monotonous and meaningless streets and squares that have been built in all our principal towns during the last eighty years. The legitimate charm of D. A., because the only one which can arise from the complete fulfillment of its object, is the charm of variety. It is the charm which our ancestors sought during the whole of the great architectural period of the middle ages, and which our architects, who in this, as in so many other respects, are returning to their principles, are now beginning to cultivate. But here, as in all similar cases, it must be borne in mind that, in general, it is the principle alone that can be revived, and that the details by which it was carried out can be legitimately copied only in the exceptional cases in which circumstances and the objects to be attained remain unchanged. The position of an Englishman in the 19th differs in many respects from that of an Englishman in the 14th c.; and to construct for the former a house in all respects resembling that which was constructed for the latter, would be to commit an error the same in kind as if we had sought for either of them a model dwelling in Pompeii or Canton.

An account of the forms of English houses from the 12th c. downwards, will be found in Parker's *Glossary of Architecture*. Apart from our own earlier examples, the forms of D.A. most suggestive for present use in this country, are those which are to be found in such wonderful beauty and variety in almost all of the older continental towns of the n. of Europe. It was from the D. A. of France and the Netherlands that that of Scotland, at

its best period, was mainly borrowed; and if we wish to improve it now, we can scarcely do better than revert to its original source.

DOMESTIC MANAGEMENT, financially considered, may be defined as the art of making a given income go the furthest possible in procuring for a family the means of living—the word living being understood in its wider and higher sense. It being assumed, as a fundamental maxim, that the outlay shall be within the income, the leading object of the art is rightly to apportion the outlay among the different requisites. How this is best to be done, can be discovered only by large experience; and if a young housekeeper were to begin her career without some indications of the path she should follow, she must fall into serious mistakes, occasioning loss and discomfort. Not that any amount of previous instruction, whether written or oral, can give the skill of experience; but attention to some of the more important maxims may help to avert very serious errors while the lessons of experience are being learned. By way of outline charts for this rather intricate navigation, we give here four schemes of household expenditure, based upon experience, and adapted to some of the more extensive classes of the British community, prefacing the schemes with a few general and miscellaneous observations.

It is a very safe rule, that the best quality of food is the cheapest in the end; "it goes further"—i.e., it gives more nourishment; but those who require to practice economy may, by going to market themselves, purchase good meat at a cheaper rate than they would if they sent for it, from reasons known to experienced buyers, such as the pieces they select not being called prime cuts, not being so well-shaped, etc., which in no way takes from the wholesomeness of the article. Again, good cooking renders things more digestible and nourishing; bad cooking is absolute waste, to say nothing of the injury it does to the stomach. How meat is rendered tender by boiling or broiling, without having its nutritive qualities extracted, is described in the articles BOILING and BROILING. For the time necessary for roasting, baking, stewing, and frying, good instructions are given in the very useful works, *The Dictionary of Daily Wants*, and Mrs. Beeton's *Book of Household Management*, where not only the mode of cooking, but the actual cost of each dish, is given.

Some books on housekeeping recommend that coal should be bought when cheap, and that groceries should be purchased in large quantities; but this is open to objections, that coal occupies a larger space than can be spared in small houses; that many articles of grocery waste in quantity or deteriorate in quality by keeping, as sugar, which loses weight, and tea, which loses aroma; and that both coal and grocery in masses, are apt to be wasted by servants, children, and thoughtless persons, from the circumstance of having large quantities to go to. Groceries may be *bought* cheaper in this way, and it is only personal experience that can decide in every case as to their being *really* cheaper. Candles and soap are the chief things that certainly improve by keeping. Candles should be hung up, if dips, but molds should be stored in boxes, and covered and kept in a dry place. Soap bought in bars, in as dry a state as possible, should be cut in lumps, six to the bar, and laid on shelves, to harden slowly.

A thorough knowledge of the art of choosing material for clothing, and making and cleaning articles of apparel, is also highly necessary, and, like good marketing for food, can only be acquired by practice. Many things must be considered in this kind of purchase; the evenness of the threads in cotton and linen fabrics, softness of texture, freedom from what is called "dress." In printed goods, the same rule is to be observed as to evenness of weaving, in addition to which, those kinds should be selected that have the pattern printed through, so as to show on the wrong side, and of a lilac or dark-blue color, as being the best for washing. Flannel goods should be chosen for their regular make, good width, and softness; and flannel articles should be made larger and longer than necessary, to allow for shrinking when washed. Good patterns for making from should be obtained, well-fitting and appropriate dress lasting longer and looking better than what is put together in an inconsiderate, slovenly manner; a clever needlewoman, like a clever cook, is the most truly economical one. The same remarks apply to furniture chintzes and linens for sheetings, etc. Articles chosen for glare and show, without regard to their being in keeping with the general style of the room or house, of a flimsy, irregular, or ill-printed make, must certainly turn out unsatisfactory and wasteful.

The accompanying scales relate to prices in London and other large English towns, and reckoned on the allowance of a loaf and a half of bread (weighing 4 lbs. to the loaf) for each individual. Young children consume less bread than full-grown persons, but they require more milk and sugar; therefore the scale can be equalized according to circumstances. Puddings and vegetable food for the children must also influence the amount for butcher's meat. It is supposed in these scales that the husband dines at home; if he dines in the city, or elsewhere, a reduction must be made in the butcher's, baker's, grocer's, and publican's bills. Half a pound of butter, and half a pound of sugar, are the usual weekly allowances for each person. If the children are too young to be educated, the money allowed in the following scales should be saved till they are older.

SCALE FOR AN INCOME OF £300 PER ANNUM, FOR A FAMILY CONSISTING OF HUSBAND, WIFE, THREE CHILDREN, A GENERAL SERVANT, AND OCCASIONAL ASSISTANT.

	£	s.	d.
Rent, taxes, water, and gas	45	0	0
Wages for servant and charwoman	14	0	0
Butcher meat, at 16s. weekly	41	12	0
Baker, 9 loaves at 8½d.; flour, 1s.	19	3	6
Grocer (tea, 1s. 6d.; parlor sugar, 7d.; children's and servant's, 1s. 8d.; parlor butter, 1s. 6d.; children's, 9d.; servant's, 8d.; spices, 4d.; cheese, 1s. 4d.; bacon, 1s. 2d.; rice, eggs, and pudding materials, 1s. 6d.), 11s. weekly	28	12	0
Vegetables and fruit	8	0	0
Milk, 3s. 6d. weekly	9	2	0
Beer for parlor and servant, 4s. weekly	10	8	0
Fuel	15	0	0
Washing (all done at home), soap, soda, mangling	4	10	0
Clothing for five persons	38	0	0
Church and charities	3	0	0
Library and books	2	0	0
Fire insurance on £300	0	6	0
Insurance on life	8	0	0
Education	20	0	0
Replenishing furniture, crockery, glass, etc	5	14	0
Traveling (change of air)	10	0	0
Doctor	5	5	0
Income-tax, at 4d. per pound	5	0	0
Omnibus, postage, and sundries	7	7	6
	£300	0	0

SCALE FOR AN INCOME OF £200 PER ANNUM, FOR A FAMILY CONSISTING OF HUSBAND, WIFE, THREE CHILDREN, AND A SERVANT.

	£	s.	d.
Rent and taxes, etc	32	0	0
Wages	5	0	0
Butcher, at 12s. weekly	31	4	0
Baker (9 loaves at 8½d.; flour, 9d.), 7s. 1½d. weekly	18	10	6
Grocer, 8s. weekly	20	16	0
Milk, 2s. 4d. weekly	6	1	4
Beer, 1s. 6d. weekly	3	18	0
Vegetables and fruit	6	10	0
Fuel	10	0	0
Washing (soap, starch, soda, etc.)	3	10	0
Clothing	17	10	0
Church and charities	1	10	0
Library and newspaper	1	10	0
Fire insurance	0	4	0
Insurance on life	6	0	0
Income-tax, at 4d. per pound	2	0	0
Education	12	10	0
Doctor	3	3	0
Replenishing	4	10	0
Traveling to sea-side	5	0	0
Omnibus, postage, sundries	8	13	2
	£200	0	0

SCALE FOR AN INCOME OF £100 PER ANNUM, FOR A FAMILY CONSISTING OF HUSBAND, WIFE, AND THREE CHILDREN.

[Rooms only should be rented, unless a lodger could be found, who would help to pay the rent of a cottage.]

	£	s.	d.
Rent, 5s. weekly	13	0	0
Butcher, 6s. weekly	15	12	0
Baker (7½ loaves at 7d.; flour, 8d.), weekly, 5s. 0½d.	13	2	2
Grocer, 4s. weekly	10	8	0
Milk, 1s. weekly	2	12	0
Vegetables, 1s. 8d. weekly	4	6	8
Beer (occasional)	1	6	6
Fuel	7	0	0
Carried forward,	£67	7	4

	£	s.	d.
Brought forward,	67	7	4
Washing (soap, starch, etc.)	2	0	0
Clothing	12	12	0
Doctor, or sick fund	3	0	0
Education	6	0	0
Life insurance	2	0	0
Fire insurance	0	2	0
Charities	0	5	6
Holiday excursions	1	10	0
Replenishing household goods	1	5	4
Books, papers, and periodicals	1	0	0
Postage and sundries	2	7	10
	£100	0	0

SCALE FOR AN INCOME OF £52 PER ANNUM, FOR A FAMILY CONSISTING OF HUSBAND, WIFE, AND THREE CHILDREN.

	£	s.	d.
Rent of rooms, 3s. 6d. weekly	9	2	0
Baker (7½ loaves at 7d.; flour, 8d.), 5s. 0½d. weekly	13	2	2
Butcher, 1s. 6d. weekly	3	18	0
Milk, 7d. weekly	1	10	4
Tea (quarter lb. at 3s.), 9d. weekly	1	19	0
Sugar (1½ lbs. at 4d.), 6d. weekly	1	6	0
Rice, treacle, and pearl-barley	1	6	0
Butter (½ lb. at 1s. 6d.; dripping, 1 lb. at 3d.), 1s. weekly	2	12	0
Candles, average 6d. weekly	1	6	0
Mustard, salt, and spice	0	4	0
Vegetables, 1s. 6d. weekly	3	18	0
Coal and wood, 1s. 3d. weekly	3	5	0
Soap and soda	1	10	0
Schooling, 3d. weekly	0	13	0
Clothing fund	3	16	6
Sick fund	0	10	0
Holiday excursions	1	0	0
Postage, books, and sundries	1	2	0
	£52	0	0

[This income could be improved by having lodgers, who would help to pay the rent, and also if a plot of kitchen-garden ground could be obtained. Since the above scales were prepared, the price of butcher meat, butter, and sundry other articles has risen considerably. This must therefore be considered.]

DOMICILE, a man's legal place of abode, or the place which the law will hold to be his residence. In determining questions of domicile, so often surrounded by difficulties, the law endeavors to follow the facts of each case, and, consequently, the legal as well as the natural view of the matter is expressed in that definition of a domicile in the code which says, "every man has his domicile where he has placed his hearth and centered his fortunes, whence he goes not forth without an occasion, from which, when he is absent, he is said to be abroad, and to which, when he returns, he is said to cease to be abroad."—Cod. 10, tit. 40, s. 7. Even in Rome, questions of domicile were not without importance, for the empire was divided for purposes of domestic government, and the inhabitant of one province was not subject to the magistrates of another. But it was in modern times, when Europe was divided into many independent kingdoms, and America was formed out of states having different local customs and laws, that the law of domicile assumed its full importance. It now constitutes one of the most difficult branches of private international law (q.v.). The following are its most general rules: 1. The place of birth is the original domicile of every one, provided that, at the time of his birth, it was the domicile of his parents; but if his parents were then on a visit or a journey; the home of the parents will be the domicile of birth, nativity, or origin (*domicilium originis*). 2. If the child is illegitimate, it follows the domicile of its mother. 3. The domicile originally obtained continues till a new one is acquired; unless it be lost by non-residence, under the provisions of a statute, as is the case with paupers, for the purposes of parish relief in Scotland. 4. Minors are generally deemed incapable of changing their domicile of their own accord, but it may be changed by a change in the domicile of the parents, which it follows. 5. If the father dies, his last domicile is that of his widow and children. 6. A wife follows the domicile of her husband. 7. The place where a man lives, if there be no ground for entertaining an opposite presumption, is his domicile. 8. If a person of full age, having a right to change his domicile, takes up his abode in a new place, with the acknowledged intention of remaining permanently fixed there (*animo manendi*), that place immediately

becomes, and that which he has quitted ceases to be, his domicile. Questions as to what amounts to intention, or what circumstances constitute sufficient proof of intention of remaining, or quitting a place of residence, are amongst the most difficult in the law of domicile. Most persons who are resident abroad have a sort of floating notion that, in certain conceivable circumstances, they would return to their native country, and to these vague feelings they give expression in a manner more or less vague. One of the most important effects of the law of domicile was as to the validity of the will which a deceased person leaves—the English rule being, that it must be according to the law of the domicile, wherever the will was made, though the law of Scotland allowed a will also to be good if it was executed according to the law of the country where it was made. A statute, however, was passed in 1861, to make the law uniform, so that the will of a British subject, as regards personal estate, made out of the United Kingdom, is deemed valid, wherever his domicile may be, if the will is conformable to the law of the country where made, or to the law of the domicile of origin. And by a later statute in 1868, even as regards real or heritable estate, an English will is to have effect given to it as regards property situated in Scotland. It is impossible, in our limits, to enumerate other effects of the law of domicile. Generally, it may be stated that it regulates the succession to personal or movable property, which is said to follow the person, and must be distributed after death according to the law of the country of which the deceased died a domiciled citizen. Heritable or real property, again, descends in accordance with the law of the land in which it is situated (*lex rei sitæ*). As to the effect of a domicile of citation in Scotland in actions of divorce, see DIVORCE, MARRIAGE.

DOMINANT, in music, the fifth above the tonic: the ruling or governing tone of the key. Ancient writers called the D. the *quinta toni*, from its being the next in importance to the tonic. The D. chord is always a major chord, the third being the *subsemitonium modi*, or leading note, which always rises a semitone to the tonic. The D. seventh is the major chord with the flat seventh above the D., and is the same in major and minor keys. The rules for the treatment of the D. seventh, and for the chord of the ninth on the D., apply to all other chords of the seventh or ninth, which arise from the other degrees of the scale. The D. seventh is a most important chord in modulation. The resolution of the D. seventh is always into the chord of the tonic, when not interrupted. The D. as a key is the nearest in relation to the tonic. Modulation into the key of the D. is so frequent in composition, that its form may be said to be stereotyped. The subdominant, or under-dominant, stands next in importance to the D., and has its place on the fourth above the tonic, or, which is the same, on the fifth below. The chord of the subdominant is major or minor, according to the mode of the key. The chords on all other degrees of the scale being either minor or diminished, give greater importance to the major chords of the tonic, D., and subdominant, in which chords all the notes of the scale are found, while the combination of these chords, giving the most perfect impression of a key, may account for their being of such importance in harmony.

DOMINANT TENEMENT. See SERVITUDE.

DOMINGO, SAN or SANTO, a maritime city of Hayti, capital of a province of the same name, and of the republic of San Domingo or the Dominican republic, stands on the s.e. coast, at the mouth of the Ozama, in lat. 18° 29′ n., and long. 69° 57′ west. It is the oldest settlement of European origin in America, having been founded in 1494 by Bartolommeo Columbus. The pop. numbers about 10,000; and the principal buildings are churches, including a cathedral, convents, hospitals, colleges, barracks, an arsenal, and a light-house. The town is surrounded by a wall 8 ft. thick and 10 ft. high, built of *mamposteria*, a composition of earth, powdered stone, and lime. The streets are broad, and intersecting at right angles. The chief trade is in timber and dye-woods. The name S. D. is sometimes applied to the whole island of Hayti. See HAYTI and DOMINICAN REPUBLIC.

DOMINIC, SAINT. See DOMINICANS.

DOMINICA, or DOMINIQUE, a British West India island, lies in lat. 15° 18′ n., and long. 61° 24′ w., containing about 290 sq.m., and (1870) 28,517 inhabitants. It is of volcanic origin, hot and sulphureous springs still attesting the fact. It is the loftiest of the Lesser Antilles, attaining, at one point, an elevation of 5,314 ft., and nearly one half of the surface consists of precipitous mountains and deep ravines. Where capable of cultivation, the soil is fertile; and, even on apparently inaccessible sites, the emancipated negroes have successfully established provision grounds. The principal productions are sugar, coffee, cocoa, cotton, lime-juice, molasses, rum, tamarinds, sulphur, indigo, rose-wood, and other cabinet woods. In 1856, the exports were £79,755; in 1866, £106,452; in 1875, £71,621. The imports in the same years were respectively £64,124, £62,188, and £62,310. In 1860, the tonnage entered and cleared was 18,777 tons; in 1865, 16,176; and in 1875, 24,748. In 1875, again, the revenue was £21,682, and the expenditure was £21,793; while in 1849, the returns had given £8,877 and £10,539. The public debt in 1878 was £8,000. The legislation of 1857 appropriated £700 for the purpose of affording aid, under statutory regulations, to schools of every denomination—a liberality which, while

accepted by Protestants, whether of the church of England or of dissenting bodies, does not appear to have been appreciated by the Roman Catholic priesthood. The abolition of slavery, independently of inferences to be drawn from correlative statistics, is admitted by all parties to have worked well in Dominica. In 1839, the planters at a public meeting acknowledged, "with feelings of unmixed gratification, the peaceable and quiet disposition evinced by the laborers, as a body, since their entire emancipation;" and, in 1852, the lieutenant-governor officially adverted to the prosperity and contentment of the same class. It is even said that most of the 20 members of assembly are men of color. The temperature, according to season and altitude, ranges from 88° F. down to chilliness; and even in the dry months, from Feb. to Aug., rain frequently falls. D. was discovered by Columbus, on his second voyage, in 1493, on a Sunday (whence its name Dominica, i.e., the Lord's day), being then thinly inhabited by Caribs. From the commencement of the 17th c. to the middle of the 18th, it may be described as having been a neutral island; but in 1759, it was captured by England, and permanently ceded by France in 1763. In 1802, it again came into the possession of France, but was finally handed over to England in 1814.

DOMINICAL LETTER, or SUNDAY LETTER, is one of the seven letters A, B, C, D, E, F, G, used in almanacs, etc., to mark the Sundays throughout the year. The first seven days of the year being marked in their order by the above letters in their order, then the following seven, and all consecutive sets of seven days to the end of the year, are similarly marked; so that the 1st, 8th, 15th, 22d, etc., days of the year are all marked by A; and the 2d, 9th, 16th, 23d, etc., by B; and so on. The days being thus marked, it is evident that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays in the year, as the number of the letters and of the days in the week is the same.

As the common year consists of 52 weeks and one day over, the dominical letters go backwards one day every common year. If the D. L. of a common year be G, F will be the D. L. for the next year. As a leap-year consists of 52 weeks and two days, the letters go backwards two days every leap-year. If in the beginning of a leap-year the D. L. be G, E will be the D. L. for the next year. This extraordinary retrocession, however, is made to take place at the intercalary day (the 29th Feb.) by the artifice of marking it by the same letter as the day preceding it, and thus the next Sunday is marked by the letter preceding that which marked the Sundays before the intercalary day. Suppose the 28th Feb. in a leap-year to be a Sunday, and marked by F, it is evident that the D. L. for the rest of the year will be E. As every fourth year is a leap-year, and the letters are seven in number, it is clear that the same order of letters must return in four times seven, or 28 years, which would, but for the leap-years, recur in seven years, and hence the solar cycle (see PERIOD). The dominical letters were first introduced into the calendar by the early Christians, to displace the nudinal letters in the Roman calendar. They are of use as a means of discovering on what day of the week any day of the month falls in a given year. See EASTER. Rules and tables for finding them are given in prayer-books, breviaries, etc., as well as in works on dates. See DATE.

DOMINICAN REPUBLIC, a state formed of the Spanish or e. section of Hayti (q.v.). Spain, in 1697, surrendered to France, by the treaty of Ryswick, the w. part of the island, retaining the remainder down to 1795. In the year last mentioned, however, the Spanish portion became nominally French. In 1814—the west having vindicated its independence—France formally relinquished, in favor of Spain, all claim to the east. In 1822, the colony, in imitation of the continental possessions, threw off the yoke of the mother-country, to link itself, more or less closely, with its African neighbors. But in or about 1843, it assumed a separate standing as the Dominican Republic, the anarchy of which it exchanged in 1861 for the despotism of its former masters. But in 1863, it again revolted, and Spain gave up the possession, and the republic has since maintained a troubled existence. The D. R. has an area of 18,000 sq.m., nearly two thirds of the area of the whole island. Its principal productions are sugar, tobacco, and coffee. Its pop., chiefly negroes and mulattoes, is estimated at 250,000. The capital, San Domingo, contains 15,000 inhabitants.

DOMINICANS, an order of preaching friars in the Roman Catholic church (*fratres prædicatores*), founded at Toulouse in 1215 by Dominic (Domingo) de Guzman. Dominic was born at Calahorra, in Old Castile, in 1170. He studied theology at Palencia, and in 1199 became canon and archdeacon of Osma in Castile. In 1205, along with his superior, Diego de Azebes, bishop of Osma, he began to itinerate through the s. of France, for the purpose of converting the "heretical" Albigenses; and convinced that the ignorance of the people and the worldliness of the clergy were great helps to the progress of heresy, he instituted the order which bears his name, for the express purpose of preaching and the cure of souls. Dominic, however, found it impossible to convert the Albigenses by this method, and therefore had recourse to another. In 1208, at the instigation of Dominic, the pope proclaimed a crusade against these "heretics;" the barons of France were summoned to take part in it, and headed by De Montfort, committed horrible slaughter on these unfortunate people. The order of the D. was confirmed by Innocent III. and Honorius III. in 1216. The members followed

the rule of St. Augustine, somewhat modified; their dress was a white garment, resembling that of the Carthusians, with a black cloak and pointed cap of the same color. In 1220 they took the vow of poverty. Dominic died at Bologna in 1221, and was canonized by Gregory IX. in 1233. He is said to have been ordinarily not a cruel or unfeeling man, but his religious passions were so vehement, that they entirely dried up the milk of human kindness in his heart, and his conduct towards heretics was merciless in the extreme. As early as 1206, he founded an order of Dominican nuns, which, after 1218, when the first convent was established at Rome, spread far and wide. These nuns followed the same rule as the friars, and were solemnly pledged to habits of industry. A *third* Dominican order (the Knights of Christ) was established in 1224, and confirmed in 1279. It was originally a company of knights and nobles who had leagued themselves together for the suppression of "heresy" by force of arms, but after the death of its founder, the order was changed into that of the *Penitents of St. Dominic*. The members of this branch of the D. were also called the Tertiary Dominicans. They were not bound by any vows, but their special duties were to observe particular fasts and devotions, and to execute great ecclesiastical judgments. They retained all their civic and domestic privileges. There were also *female* Penitents of St. Dominic, a few of whom, however, betook themselves to a conventual life, and became nuns. These few were chiefly in Italy; the most famous was St. Catharine of Siena. The glory of apostolic poverty, which encircled the D., the privileges which they possessed—especially of preaching and hearing confession—and the circumstance that as early as 1230, only 15 years after the foundation of their order, they secured a chair of theology in the great university of Paris, all helped to rapidly increase their numbers and influence. Within *six* years after their establishment, they had spread to England through one Gilbert du Fresney, and founded a monastery at Oxford. "The monks," writes a contemporary annalist, Matthew Paris, himself a Benedictine, "did not, in three or four hundred years, ascend to such a height of greatness as the friars, minors and preachers, within twenty-four years after they began to build their first house in England." Their progress was scarcely less rapid in Scotland, where they found a munificent patron in king Alexander II., who is said to have met St. Dominic at Paris about the year 1217. In Britain, the D. were called the *Black Friars*. In France they received the name of Jacobins, from the Rue St. Jacques (Lat. *Jacobus*) in Paris, where they first established themselves. Their monasteries arose throughout all Christendom, and were even to be seen on the shores of Asia, Africa, and subsequently America. Their monarchical constitution, which bound all the branches and congregations of the order under one grand head (*magister ordinis*), insured their progress and the co-operation of their efforts to secure influence in church and state. Through their preaching and proselytizing, it is undeniable that they exercised, at the time of the foundation of their order, and for a considerable time after, an influence alike extensive and beneficial. They have produced several great scholars and men of genius, such as Albertus Magnus; Thomas Aquinas, the normal theologian of the Roman Catholic church, and Raymund de Pennaforte. They have, however, acquired a black reputation in history in connection with the inquisition (q.v.), in which they were the chief agents. After 1425, when they obtained permission to accept endowments, they in some measure refrained from begging, and engaged themselves more with politics and theology. Their great rivals were the *Franciscans* (q.v.), and the mutual animosity of the two orders was strongly exhibited in the disputes of the Thomists and Scotists. These two orders divided between them the honor of controlling the church, and often the Catholic states of Christendom, until the rise of the Jesuits in the 16th c., who gradually drove both from the schools and the court, when the D. were compelled to return to their original vocation. Their power was, however, again revived to a certain extent in 1620, when the censorship of books was conferred on the master of the Vatican at Rome, who must always be a Dominican. In the 18th c., the order of D. possessed 1000 monasteries and convents, divided into 45 provinces, besides 12 separate congregations or sects. At present, the order flourishes only in Italy, France, Hungary, Switzerland, and America. The Dominican nuns, who are not numerous, have convents in Italy, France, Belgium, Hungary, Bavaria, and America.

DOM'INIS, MARCUS ANTONIUS DE, an ecclesiastic whose career was both singular and checkered. He was b. in 1566 at Arba, on the coast of Dalmatia, and educated, first at Loretto, and subsequently at Padua, where he greatly distinguished himself both by his ability and the varied character of his studies. While at Padua, he taught mathematics, physics, and eloquence. Having completed his theological curriculum, he was, after some time, appointed bishop of Segni, and two years later, archbishop of Spalatro, in which capacity, however, he quarreled with the pope, and having, moreover, exhibited certain Protestant leanings, he found it expedient to resign his post. In 1616, he came to England, where he was hospitably received. King James appointed him dean of Windsor; and while holding this office, he wrote his *De Republica Ecclesiastica*, a work in which he endeavored to show that the pope had no supremacy over other bishops, but was only *primus inter pares*. D. published one or two other productions between 1617 and 1618; but finding Anglicanism far from satisfactory, a revulsion of feeling occurred, and D. once more looked and longed for the unity of the Catholic

church. The motives that induced him to return to the Roman Catholic church are not known. Most writers consider that he was actuated by avarice and ambition, but a critical appreciation of his character would lead us to doubt this harsh judgment. He was, it has been supposed, desirous of discovering a church broad enough to form the basis of a universal Christianity. Men holding such opinions are always misunderstood, and so D., even after his return to Rome, was still suspected of heresy. In consequence, he was imprisoned in the castle of St. Angelo, where he died, Sept., 1624. Being subsequently condemned as a heretic, his body was raised from its grave, and burned.

While at Padua, D. wrote his *De Radiis Visus et Lucis in Vitris Perspectivis et Iride* (Venice, 1611). He was the first to point out that in the phenomenon of the rainbow, the light undergoes, in each rain-drop, two refractions and an intermediate reflection.

DOMIN'IUM, a Roman law-term, which has been received into the technical language of most of the legal systems of Europe. It may be described as a full legal right in and to an object—as the right from which alone legal possession could flow, but which actual possession alone could never confer, unless such possession had endured for the period of legal prescription. The right to possess is thus distinguished from the right arising from possession, which is the usufruct. Ownership or D. may be either absolute—that is to say, it may include the beneficial interest in the subject—or it may be bare ownership, consisting in some limited power over it at the time, or some ultimate right to it at a future time. D. must not be confounded with imperium (q.v.), which has a totally different signification.

DOM'INO, the name formerly given to the garb worn in winter by priests while officiating in cold edifices. It is now used to signify a masquerade costume, consisting of an ample cloak or mantle with wide sleeves. See MASQUERADE.

DOM'INOS, the name of a game, usually played with 28 oblong, flat pieces of ivory or bone, etc., each of which bears two numbers marked by points from nought to six. The party wins who has first played out his tablets, or, if this has been found impossible, who has the fewest points on the tablets still remaining. The game of D. has been attempted to be traced back to the Greeks and Hebrews, and also to the Chinese. So much is certain, that it was introduced about the beginning of the 18th c. from Italy into France, where it immediately became popular in the larger towns. From Paris it spread to Germany, where, as in France, it is now played in every coffee-house. The Cafe de l'Opera, in Paris, long boasted of assembling the most expert players; an honor, however, which was warmly contested by the establishments of Rouen and Poitiers.

DOM'INUS, the Latin word by which we commonly render lord, but which more properly signifies master, as opposed to slave (*servus*). Aurelianus is said to have been the first emperor who adopted D. as a title of honor on his medals, though it had long been made use of in conversation and in correspondence in that sense, as by Pliny in addressing Trajan. In legal phraseology, the *dominus litis* is the person really interested in the issue of an action, though not necessarily the pursuer.

DOMITIA'NUS, T. FLAVIUS, emperor of Rome from 81 to 96 A.D., was the son of Vespasian, and younger brother of Titus, whom he succeeded on the throne. The earlier years of his reign were on the whole advantageously occupied for the public benefit. Many good laws were passed, the provinces carefully governed, and justice rigidly administered. As he grew older, however, his ambition, his jealousy, and his pride, wounded by the failure of his campaigns against the Dacians and the Marcomanni, in 87 A.D., began to instigate him to the most atrocious cruelties. By murder or banishment, he deprived Rome of nearly every citizen conspicuous for talent, learning, or wealth. To win the army, he greatly increased the pay of the soldiers, and secured the favor of the people by prodigal largesses and gladiatorial shows and games, in which he sometimes took part in person. His cruelties became at length so intolerable, that a conspiracy—encouraged, if not organized—by his wife Domitia, whom he had doomed to death, was formed against him, and the tyrant fell under the dagger of the assassin, 18th Sept., 96 A.D.

DO'MO D'OS'SOLA, a charming little t. in the extreme n. of Piedmont, at the foot of the Simplon, near the right bank of the Tosa, which flows into Lago Maggiore. Its general aspect is peculiarly Italian. It has some trade and several handsome buildings, but is chiefly noteworthy as being a starting-point for tourists who wish to make excursions up the southern valleys of the Alps. The chief places of interest in the vicinity are the Val Anzasca, the Val Vigezzo, and the Falls of the Tosa. From D. D. the Simplon can be ascended in seven hours. Pop. 2,480.

DON (anc. *Ta'nais*), a river of Russia, has its source in a small lake in the government of Tula, in lat. about 53° 45′ n., and long. 38° 10′ east. It flows at first in a south-eastern direction through the governments of Tula, Riazan, Tambov, and Woronetz, and after winding s.w. through the country of the Don Cossacks, it advances to its embouchure in the sea of Azov, which it enters by three mouths, only one of which is navigable. The D. receives 80 affluents, of which the principal are the Sosna and the Donetz on the right, and on the left the Khoper, the Medvieditza, the Sal, and the Manitch. Its total length is about 1150 miles. Its course is obstructed by frequent

sand-banks, which, when the water is low, render navigation impossible to any but flat-bottomed boats. From April to June, however, during which months it overflows its banks, and forms unwholesome swamps on either side, it is navigable as high as Zadonsk, 600 m. from its mouth. The D. is connected by a canal with the Volga, and by this means the produce and manufactures of the interior are conveyed to the southern provinces of Russia. The waters of the D. abound in fish, the traffic in which commodity is considerable, especially in its lower course.

DON, a river of Aberdeenshire, rising on the w. border of the county in a peat-moss, 1640 ft. above the sea. It runs n.e., then e., and lastly s.e., entering the sea a mile n.e. of Old Aberdeen. It has a total course of 78 m., but only 42 in a straight line, and it drains a tract of 495 sq.m., chiefly composed of granite and gneiss, with a little syenite and clay-slate. In the upper part of its course, it receives some large mountain streams, but its chief tributary is the Ury, which comes 24 m. from the n.w. Near the junction of the Ury and D. is a curious conical gravel hillock, called the Bass, the subject of a prophecy by Thomas the rhymer. The D., at less than a mile from the sea, is crossed by the old "birg o' Balgownie," of one Gothic arch. Lord Byron, while a youth, had a superstitious dread in crossing this bridge, from an old prophecy connected with it. To keep this bridge in repair, sir Alexander Hay, in 1605, left an annuity of £2 5*s.* 8½*d.*, which sum has now accumulated to about £19,000, in addition to about £17,000 spent 40 years ago in the erection of a new bridge over the D., a quarter of a mile lower down.

DON, a title. See DOM, *ante*.

DON, or DUN, a river of the West Riding of Yorkshire, rising in the moors on the borders of Derbyshire and Cheshire. It runs 55 m., first s.e. to Sheffield, and then n.e. by Rotherham, Doncaster, and Thorne, into the Aire, which soon afterwards unites with the Ouse. Its basin consists of carboniferous and permian strata. Its chief tributaries are the Rother, Dearne, and Wente. It is navigable for the last 39 m. of its course below Sheffield, by the aid of artificial canals and cuts.

DO'NA, SAN, a t. of n. Italy, in the province of Venice, 18 m. n.e. from Venice, on the left bank of the Piave. Pop. 5,550.

DOÑA AÑA, a co. in New Mexico, on the border of Texas and Mexico, intersected by the Rio Grande and the Rio Pecos, and by several mountain ridges; about 20,000 sq.m.; pop. '70, 5,864. The productions are wheat, corn, wool, and live stock. Co. seat, Doña Aña.

DONABUE, a t. of Pegu, stands on one of the main branches by which the Irrawaddy enters the bay of Bengal, lat. 17° 10′ n., and long. 95° 27′ east. It is within the delta of this grand artery of the country, and is situated 65 m. to the n.w. of Rangoon, and 54 to the n.e. of Bassein, the principal seaports of the newly acquired British province. It is only on historical grounds, however, that the place is worthy of notice. Here the English were repulsed with considerable loss in both the Burmese wars; first in 1825, and again in 1853.

DONAGHADEE', a seaport in the n. of the co. of Down, on the Irish Channel, 18 m. English (14 Irish) e.n.e. of Belfast, and 22 m. s.w. of Portpatrick, Wigtonshire, with which it is connected by a submarine telegraph cable. It forms a crescent round the harbor, with two chief streets, one facing the sea. Its exports are cattle, grain, potatoes, etc. The embroidery of muslin was established in D. about 50 years ago, and it still maintains its pre-eminence in this branch of manufactures, which gives employment to the greater part of the female population. Pop. '71, 2,226. On the n. of D. is a conical mound, 140 ft. high, 480 ft. in circuit at the base, and surmounted by a modern miniature castle 50 ft. high, whence there is a very extensive prospect, including the Scotch coast and the Isle of Man. The Danes, in 837, are said to have destroyed a university which stood on a level a little s. of where D. now is.

DONALDSON, JAMES LOWRY, b. Md., 1814; graduate of West Point; served in the Florida and the Mexican wars, and in the war of the rebellion, in all with distinction; rose to be maj.gen. in 1865, and in 1869, retired from active service. He wrote *Sergeant Atkins*, a tale of the Florida war.

DONALDSON, JOHN WILLIAM, was b. in London, June 10, 1811. His father, Stuart Donaldson, a wealthy merchant, was descended from an old Scotch family; his mother was daughter of J. Cundall, esq. of Snail Green, Lancashire. He was educated first at the university of London, and afterwards at Trinity college, Cambridge. He graduated as B.A. in the year 1834, and obtained the second place in the first class of the classical tripos. The year following, he was elected fellow. His first work was a volume, entitled *The Theater of the Greeks*, partly original and partly compiled, which, having been carefully revised and improved in six successive editions, still holds its place as a school and college class-book. He was still resident at Cambridge, holding the office of assistant-tutor of Trinity, when he published the first edition of his *New Cratylus* (1839), a work remarkable for its research, erudition, and boldness, and as being the first attempt, on a large scale, to familiarize Englishmen with the principles of comparative philology, as established by the great scholars of Germany—Pott, Bopp, Grimm, and

others. Availing himself largely, but not servilely, of the labors of these men, he developed their principles, and continued their researches, with a special application to the history, structure, and etymology of the Greek language. The *New Cratylus*, in its latest, largest, and most improved form, is still the most important work which has been written in English upon the subject. Mr. D. soon after married the daughter of sir John Mortlock of Stapleford, and accepted the post of head-master of the grammar-school of Bury St. Edmunds, having previously taken holy orders. Notwithstanding the engrossing nature of his duties as head-master, he found time to prosecute and extend his linguistic studies, embracing in their wide range Hebrew and Arabic, and most of the dialects of modern Europe. In the *Varronianus*, of which the first edition appeared in 1844, he undertook to accomplish for Latin philology what in the *New Cratylus* he had done for Greek. He dedicated the work to the bishop of St. Davids (Dr. Thirlwall), in grateful recognition of the benefits derived from his Cambridge teaching. Among his other works of this period may be mentioned an edition of Pindar, of the *Antigone* of Sophocles (with a verse translation), *Maskil le Sopher* (a treatise on Hebrew grammar), and finally *Jashar*, a book written in Latin, and published at Berlin, the object of which was, by critical tests, to distinguish the fragments of the lost book of *Jashar* imbedded in the Pentateuch. This book was violently assailed by the so-called "religious press," which did not prevent its undaunted author from issuing a second edition.

Soon afterwards he resigned his place at Bury St. Edmunds, and returned to Cambridge, where he gave a course of lectures on Latin synonyms, and occupied himself with tuition. Here he wrote a volume entitled *Christian Orthodoxy*. Some critics vehemently disputed its right to the title. A smaller volume on classical scholarship followed. He had previously issued a *Greek Grammar* and a *Latin Grammar* for the use of schools. These, during his residence at Cambridge, he recast and enlarged, so as to rival in profundity and copiousness any other works on the same subjects. In 1856, he was appointed one of the classical examiners in the university of London, an honor which he owed chiefly to the strenuous report of Mr. Grote, the historian of Greece.

He was engaged in superintending the compilation of a new *Greek Lexicon*, when his health, for the first time, began to show symptoms of failure. A tour in Germany during the summer of 1860 did not produce any change for the better. Incipient disease of the brain, the result of overwork, showed itself first by neuralgic pains, and afterwards by more alarming symptoms. He removed to London, and died in his mother's house, after some weeks of great suffering, borne with calm and patient courage, on the 10th of Feb., 1861. In private life, he was distinguished by kindness of heart, ready wit, unfailing vivacity, and varied conversational powers. It ought, perhaps, to be mentioned that a little work, published anonymously under the title of *Philelentherus Anglicanus*, which made no small sensation at the time of its appearance, has been very generally attributed to Dr. Donaldson.

DONALDSON'S HOSPITAL, an extensive establishment at Edinburgh, of the character of Christ's hospital, London. Its founder was James Donaldson, a successful printer in Edinburgh, son of Alexander Donaldson, publisher, of whom some notice is taken in the articles BOOK-TRADE and COPYRIGHT. In 1763, Alexander started the *Edinburgh Advertiser* newspaper, which was afterwards conducted by his son James, and became a lucrative concern in his hands. Dying in 1830, James bequeathed the fortune of two generations, amounting to about £215,000, to trustees, for the endowment and erection of a hospital for the maintenance and education of poor boys and girls. The building, which occupies a commanding situation to the w. of Edinburgh, was begun in 1842, and finished in 1850, is a large and beautiful quadrangular structure, in the Elizabethan style, the late W. H. Playfair being the architect. The cost of the edifice and furnishings was nearly £124,000, but as this was defrayed by the accumulated interest, the original endowment remained untouched. The hospital can accommodate 300 children —150 boys and 150 girls: in 1877, it contained 214 children (120 boys and 94 girls), of whom 115 (70 boys and 45 girls) were deaf and dumb. Those eligible for admission are declared to be, "1st, Poor children of the name of Donaldson or Marshall, if appearing to the governors to be deserving; 2d, Such poor children as shall appear to be in the most destitute circumstances and the most deserving of admission." None are received whose parents are able to maintain them. The children are clothed and maintained in the hospital, and taught such useful branches of a plain English education as will fit the boys for trades, and the girls for being servants. The age of admission is from seven till nine, and that of leaving the hospital fourteen years. The children wear a simple uniform of modern fashion.

DONATELLO (properly, DONATO DI BETTO BARDI), one of the restorers of the art of sculpture in Italy, was b. at Florence, in 1383. He belonged to the Donato family, which reckons several scholars among its members, and has given some doges to the republic of Venice. *Donatello* was a diminutive given to the artist in childhood. He received his earliest instructions from Lorenzo Bicci. His first great works in marble were the "St. Peter" and "St. Mark" in the church of St. Michael in his native city. His own favorite, however, was the statue of an old man in the garb of a senator, on the steeple of the same church. It is known under the name of *Zuccone* (the gourd

or bald-head). He died at Florence, Dec. 13, 1466. D.'s principal works, besides those already mentioned, are a statue of "St. George" (in marble), "Judith bearing the Head of Holofernes" (in bronze), the "Crucifixion" (in wood), several statues of the "Baptist" (executed in various materials), and a grand equestrian statue (in bronze) of Erasmus Gattemelata, erected on one of the public places of Padua. He also executed a number of bass-reliefs. The whole tendency of D.'s genius was towards a reproduction of the antique; and his style, though not free from harshness and the rudeness of early art, sometimes reminds one of the glorious productions of ancient Greece.

DONA'TI, GIOVANNI BATTISTA, 1826–73; an Italian astronomer, professor in the royal institution at Florence. June 2, 1858, he discovered the comet now bearing his name. He discovered other comets, made spectroscopic observations, and published diagrams of lines in the spectra of the stars. In 1864, he was appointed director of the Florence observatory.

DONA'TION. A donation in prospect of death, *donatio mortis causa*, differs from a gift *inter vivos*, inasmuch as it is incomplete, and revocable during the donor's life, or ambulatory, as lawyers say. It differs from a legacy, on the other hand, in that it requires no probate, for it is not a testamentary act, the donee's title proceeding directly from the donor in his life-time. In Scotland, following the law of Rome, it is common to distinguish between donations *pure*—or those which do not take place in anticipation of death, marriage, or any other specific event—and gifts. Such donations are in reality gifts, but gifts which are not intended to be immediately delivered. It was with reference to this species of D. that the equitable arrangement called the *beneficium competentiæ* was introduced, by which the donor was allowed to retain as much as was necessary for his own subsistence before fulfilling the obligation, if he was reduced to indigence. Another implied condition of a D. by the Roman law was, that when any one who had no children made a D. of the whole or the greater part of his estate, the D. became void if he had children afterwards; the presumption being, that he would not have given his property away if he had anticipated that he was to become the father of a family. It is a general principle of law, that a D. is never presumed; but this rule suffers an exception in the case of aliment given without an agreement to pay board, which is presumed to be gratuitous unless given by one who makes a livelihood of entertaining strangers. Minors, and persons incapable of contracting, are not presumed to have been alimented gratuitously, unless their relationship to their entertainer be such as to warrant the presumption. Where the minor is possessed of an adequate separate estate, even the father may claim the expense of maintaining him, and the rule applies with greater force to all more distant relatives. Donations between man and wife (*inter virum et uxorem*) were by the Roman law, and are by the law of Scotland, revocable by the donor at any time during his or her life, *ne conjuges mutuo amore se spolient* (lest the spouses should despoil themselves from mutual love). But mutual grants for substantial considerations between the spouses are not revocable, if there be any reasonable proportion between the two. Thus, where there has been no ante-nuptial contract of marriage, the husband may provide for the wife in the event of her survivance, and the provision will be effectual in so far as it is rational. It will be revocable only *quoad excessum*. Donations in the prospect of marriage (*donationes propter nuptias*) in the Roman law were given by the husband in security of the dowry or *dos*, which he was bound to pay back to the wife or her relatives on the dissolution of the marriage. When the *dos* was returned to the wife, the D. was returned to the husband. In the law of Scotland, when donations *propter nuptias* are spoken of, we are to understand provisions made by the husband not with a view to the dissolution of the marriage, but as an equivalent for the dowry, or, as it is called in Scotland, the *tocher*.

DONA'TI'S COMET, discovered June 2, 1858. It was nearest the earth Oct. 10, when its apparent length, 51,000,000 m., made it a sight of wonderful magnificence. Its distance in aphelion is estimated at 15 billions m., and its return to the solar system is not expected till the year 3808.

DO'NATISTS were the followers of Donatus, a Numidian bishop who opposed the election of Cecilianus in 311 A.D. to the bishopric of Carthage, on the ground of the ordination having been performed by one who had been a traditor, or traitor—that is, one who, during persecution, had given up the sacred books to the pagan authorities; and also because Cecilianus had exhibited great hostility towards the victims of the late persecution. After some time, the council of Arles (Aug. 1, 314 A.D.) decided against Donatus, who in a short time seceded from the Catholic church, and formed a distinct sect, which, by 330, had 172 bishops in northern Africa. The D., like the followers of Novatian (q.v.), went upon the principle, that the essence of the true church consisted in the purity and holiness of all its members individually, and not merely in its apostolical and Catholic foundation and doctrine. They therefore both excommunicated all lapsed and gross offenders, not receiving them again but on being re-baptized, and also held that the efficacy of the sacraments depended on the worthiness of the administrator. Driven to fanaticism by the oppression of the secular power, they not only denied to the state all right to meddle with ecclesiastical affairs, but bands of Donatist ascetics collected, attacked the imperial troops (348), and continued to devastate Mauritania and Numidia for a dozen years. In the beginning of the 5th c., they seem to have almost

equaled the Catholics in number, and the eloquence of Augustine and these verities of Honorius were exercised upon the sect in vain; they continued to exist as a separate body. But by adopting a more prudent plan of proceeding, the Catholic bishops had, by the end of the 6th c., induced most of those that had left to return to the bosom of the church; and in the 7th c. the D. were extinct. Donatism is regarded by Neander (see *Dogmengeschichte*, translated into English by J. E. Ryland: Bohn, vol. ii. page 394) as a reaction against that form of Catholicism, "which conceived the church to be an outward organism, continued by the succession of bishops, who formed the necessary medium of communication with Christ, and for partaking in the Holy Spirit and salvation." "Whoever is shown to be a Christian in a right and lawful manner, is to me a Catholic," was a saying of the D.; while the church in general, guided by Augustine, wished to let the worthy and unworthy remain mixed together, and to defer the separation to the final judgment." Thus, while the D. had the merit of superior strictness of theory, it must be acknowledged that their views were less practical than those of their opponents.

DONA'TUS, ÆLIUS, a well-known grammarian and commentator, who taught grammar and rhetoric at Rome about 355 A.D., and was the instructor of St. Jerome. He wrote treatises, *De Literis; Syllabis; Pedibus et Tonis; De Octo Partibus Orationis;* and *De Barbarismo; Solecismo*, etc., the best edition of which is in Lindemann's *Corpus Grammaticorum Latinorum* (vol. i.). These writings form together a pretty complete course of Latin grammar, and in the middle ages were the only text-book used in the schools, so that Donat came, in the w. of Europe, to be synonymous with grammar, or with the elements of any science. *The Donat into Religion* is the title of a book by an English bishop, and there was an old French proverb, *Les diables estoient encore à leur Donat* (The devils were yet in their grammar). The Latin grammar of D. has formed the groundwork of the elementary treatises on that subject to the present day. D. was one of the first books on which the art of printing by means of letters cut on wooden blocks was tried, and copies of these Donatuses are reckoned among the greatest of bibliographical curiosities. The author also wrote a commentary on Terence, of which we possess only a part extending to five comedies, to be found in the edition of Terence by Kloz (2 vols., Leip. 1838).

From this D. we must distinguish a later grammarian, TIBERIUS CLAUDIUS DONATUS, from whom we have a very worthless life of Virgil, prefixed to many editions of that poet, and fragments of a commentary on the *Æneid*.

DONAUWÖRTH, a t. of Bavaria, situated at the confluence of the Wernitz and the Danube, about 25 m. n.n.w. of Augsburg. It is well built, in the form of an amphitheater, round the side of a hill, and is surrounded by walls. It was formerly a free imperial city of considerable importance, but it has now sunk into an insignificant place of 3,000 inhabitants. It is historically interesting, however, as the main cause of the thirty years' war; the severity of the punishment meted out to the inhabitants in 1607, in consequence of their adoption of the reformed doctrines, and their assault on a Roman Catholic procession of the "host," having led to the formation of the Protestant league, and Catholic union, the opponents in that long and severe struggle. It is likewise associated with the name of Marlborough, who stormed and carried the intrenched camp of the Bavarians here in 1704. Also, on the 6th Oct., 1805, the French, under Soult, obtained a victory here over the Austrians, under Mack.

DONAX, a genus of lamellibranchiate mollusks, of the family *tellinidæ*, with shell of two equal valves, which close perfectly, and are of a triangular form, prettily striated from the beak to the margin, the beak occupying the obtuse angle of the triangle. The species of D. are generally small. Several are found on the British coasts. The fossil species are not numerous, and belong to the eocene formation.

DON BENI'TO, a t. of Spain, in the province of Badajoz, 55 m. e. of the city of that name. It is situated near the left bank of the Guadiana, and is in general well built, with wide and tolerably clean streets. It has several squares, the chief of which is lined with the principal structures in the town, including the town-hall, prison, and a convent; and in the center is a public promenade. D. B. has manufactures of woolens, wine, and oil, and its proximity to the Guadiana affords it great trading facilities. Pop. about 15,000.

DON CAR'LOS. See CARLOS.

DONCASTER, a municipal borough in the West Riding of Yorkshire, on the right bank of the Don, on the Great North road, 35 m. s. of York. The country around is flat, but beautiful. Fine old elms line the broad and level road from the south. D. is very clean and well built. The High street is a mile long. It has manufactures of iron, brass, sacking, linen, and agricultural machines. Its corn-market is one of the largest in the kingdom. Pop. '71, 18,768. D. was the ancient *Danum*, and lay on the Roman road from York to Lincoln. Roman coins, urns, and a votive altar have been found here. It was the *Dona Castre* of the Saxons. The Saxon Northumbrian kings had a palace here. D. was burned by lightning in 759, and frequently ravished by the Danes. It has long been famous for its annual races, begun in 1703, and held a mile s.e. of the town in the second week of Sept. Col. St. Leger, in 1776, founded stakes

which have been yearly run for by the best horses in England. On an eminence 5 n w.s.w. of D. are the ruins of Conisborough castle, a Norman-Saxon round tower, 37 ft. in diameter and 86 ft. high, with walls 15 ft. thick, strengthened by square buttresses reaching the whole height. The door is arrived at by an external flight of 37 steps, and within is a cylinder open to the heavens.

DON COSSACK, a government in Russia in Europe, n.e. of the sea of Aral, on the river Don; 61,911 sq.m.; pop. '70, 1,086,264. The country is generally level and sandy, and the climate mild, though in winter there are sometimes very cold and severe storms. Cattle-raising is the principal business; hemp and flax are raised, and wine, salt, and caviare are among the exports. Seat of government, Novo-Tcherkask.

DONDRA HEAD, the most southerly extremity of Ceylon, is in lat. 5° 55′ n., and long. 80° 38′ east. As compared with cape Comorin, the corresponding point in the peninsula of Hindustan, it more directly faces the Indian ocean, and lies nearer the grand thoroughfares of eastern commerce. An adjacent village of the same name numbers 900 inhabitants.

DONEGAL', a seaport in the s. of Donegal co., at the mouth of the Eske, on a shallow creek of Donegal bay, 11 m. n.n.e. of Ballyshannon. It lies in a rich alluvial tract, surrounded on three sides by hills, behind which rise lofty picturesque mountains. Pop. '61, 1516; '71, 1422. D. exports corn and butter. On the river is Donegal castle, formerly belonging to the O'Donnels of Tyrconnel. On the shore are the ruins of a Franciscan monastery, founded in 1474 by Hugh O'Donnel. Near D. is a frequented sulphureo-chalybeate spa.

DONEGAL, a maritime co. in Ulster province, and washed by the Atlantic on the n. and west. Its greatest length is 85 miles; greatest breadth, 41; average, 27; area, 1865 sq.m., one third being arable, and $\frac{1}{100}$ in wood. The coast-line is 395 m. long, being indented by many deep bays, and loughs, some 2 to 20 m. broad, and 15 to 25 long. Some of the coast cliffs rise from 500 to 800 feet. Of the many isles off the coast, 17 are inhabited. Except a small tract in the e. and s.e., the surface is mountainous, moory, and boggy, with many small lakes and rivers, associated with endless fairy tales and traditions. The highest hill, Erigal, rises 2,462 ft., and several other hills exceed 2,000 feet. The mountain-ridges run n.e. and s.w. The largest stream is the Foyle, running 16 m. n.e. into Lough Foyle. Derg is the largest loch. The geological structure of D. consists of granite, metamorphic rocks, and graywacke, with Devonian and carboniferous limestone strata and trap. White marble occurs at Dunlewy. Except on the Foyle, the climate is moist, raw, and boisterous from violent w. and n.w. winds. There are many ruins of houses and churches overwhelmed with sand. Of the Irish counties, D., in ratio to its area, has least land in cultivation and occupied in towns and woods. The soil is generally cold and poor on the primitive rocks, and light clay on the slaty. In 1878, 237,222 acres were in crop, the largest proportion being oats, potatoes, turnips, and flax. There are manufactures of linen, worsted stockings, worked muslins, and kelp, and fisheries of cod, sole, plaice, herring, and mackerel. Trade is chiefly through Londonderry. Inaccessible retreats and abundance of turf-fuel made D. at one time the chief seat of illicit distillation in Ireland. It contains 6 baronies, 8 poor-law unions, and 51 parishes. Pop. '41, 296,448; '51, 255,160; '71, 218,324, of whom 165,270 are Roman Catholics, 27,125 Episcopalians, 23,080 Presbyterians, and the rest of other denominations. D. sends two members to parliament. The towns are small, the chief being Lifford, the county town; Ballyshannon, Letterkenny, Rathmelton, Donegal, and Killybegs. Industrious farmers and artisans occupy the low fertile tracts. The population of the mountain districts has been much diminished by emigration. Till 1612, when James I. planted Ulster with English and Scotch settlers, the s. part of D. was called Tyrconnel, and belonged to the O'Donnels, who, from the 12th c., were inaugurated as princes of Tyrconnel on Doune rock, near Kilmacrenan. D. has many ruins and traces of forts, of 30 religious houses, castles, and of the palace of the north Irish kings on a hill near Lough Swilly. Near Derry is the coronation-stone of the ancient Irish kings. D. contains many memorials of St. Columba. Warren, in 1798, captured a French fleet off Tory isle, which contains the remains of seven churches, two stone crosses, and a round tower. St. Patrick's Purgatory is on an isle in Loch Derg. Near Horn Head is a hole in the roof of a cave, called M'Swiney's Gun, from which issue, at times, jets of water with loud explosions.

DON'ELSON, FORT, on Cumberland river, Tenn., 12 m. e. of Fort Henry. It was an important point in the war of the rebellion, and was strongly held by the confederates until Feb., 1862, when the union forces under Grant laid siege to it. Buckner, the confederate commander, asked for terms, to which Grant replied: "No terms except unconditional surrender will be accepted. I propose to move immediately upon your works." Before night the fort and 8,000 prisoners were surrendered.

DONETZ', a river in s. Russia, a tributary of the Don. It is about 500 m. long, and is chiefly in the country of the Don Cossacks. It is navigable to Zmiev.

DONGARPUR', a fortified t. of Rajputana, in Central India, is in lat. 23° 50′ n., and long. 73° 45′ e., and is 345 m. to the n. of Bombay. It is the capital of a protected state of the same name, which contains 1000 sq.m., and 100,000 inhabitants.

DONG-NAI' is the name of a river and a t. in Anam or Cochin-China, an oriental state which has recently derived an adventitious interest from the combined attacks of France and Spain.—1. The river enters the Chinese sea, by various mouths, about lat. 10° 20′ n., and long. 107° east. It is navigable for large vessels as far up as Sai-gon, which, with a pop. of 180,000, and a trade of great value, stands 40 m. from the coast. From this city, a canal of 23 m. in length connects the D. with the Menam-kong, or Cambodia, which, in a more westerly channel, divides Anam from Siam.—2. The town is on an affluent of the river, being 25 m. to the n.e. of Sai-gon.

DONGOLA (NEW), or MARA'KAH, a t. of Nubia, capital of a province of the same name, is situated on the left bank of the Nile, in lat. 19° 10′ n., long. 30° 22′ east. D., which is a military station, is also a place of considerable trade. Its exports are chiefly slaves, in return for which it receives goods of all kinds from Cairo. Its bazaar is well supplied, and it has an indigo-factory belonging to the khedive of Egypt. Pop. estimated at 20,000. In the vicinity, on the fertile river-island of Argo, are the ruins of old Ethiopian and Egyptian buildings, colossal statues, etc.—OLD DONGOLA is a ruined town on the right bank of the Nile, 75 m. s.s.e of New Dongola. On the e. side, the desert in some places stretches down to the water-edge.

DONIPHAN, a co. in n.e. Kansas, on the Nebraska border and the Missouri river; crossed by the old California overland route, and by the Atchison and Nebraska, and the St. Joseph and Denver City railroads; 391 sq.m.; pop. '78, 15,122. The surface is chiefly prairie, and the soil good, producing wheat, corn, oats, butter, etc. Co. seat, Troy.

DO'NIS CONDITIONAL'IBUS, STATUTE DE, called also the statute of Westminster the Second, 13 Edw. I. c. 1, is the statute which first established in England the power of creating an entail (q.v.). Before the passing of this act. it had been held by the judges that a conveyance to a man and the heirs of his body was a fee-simple conditional, i.e., a fee-simple (q.v.) on condition that the donee should have heirs of his body; and this condition having been purified by the birth of an heir, the donee was at liberty to alienate or burden the land, and thus to defeat the original gift. In this respect, however, the gift differed from a fee-simple, that if the donee failed to exercise his power of alienation, and died without issue surviving, the land descended not to the heirs of the donee, but to those of the donor. To counteract the decision of the judges above noticed, the statute *de donis* was passed. It provided "that the will of the giver, according to the form in the deed of gift manifestly expressed, shall be from henceforth observed." From the date of this act, the courts recognized two estates in the land—viz., that of the donee, which is called a fee-tail (q.v.), and that in the donor, which was a reversion or expectancy, by which, on the termination of the estate-tail, the lands would revert to the original owner. As to the manner in which even this intention was defeated, see ENTAIL. Not only lands, but rents, dignities, etc., might be entailed under this act. *Co. Litt.* 20 *a.*

DONIZET'TI, GÄETANO, a famous Italian composer, was b. at Bergamo, in Lombardy, 1798. He learned the elements of music at the lyceum of that town, and later, the art of composing under Simon Mayr. D.'s first compositions belonged exclusively to church-music, but the only success he obtained by them was an appointment as a chorister at the church of Basilica di San-Maggiore. D. gave up that position very soon, and after several vicissitudes, entered the military service of Austria. D. now devoted himself to the composing of operas, of which he has left more than 60. *Enrico di Borgogna,* 1819, with 19 others that followed, failed to produce any marked result; and it was not until 1831 that his renown began to spread beyond Italy. *Anna Bolena, L'Elisir d'Amore, Lucrezia Borgia, Marino Faliero, Lucia di Lammermoor, La Fille du Régiment,* followed each other in rapid succession, adding new luster to his fame. D.'s last productions were *Don Sebastiano* and *Caterino Cornaro.* He died at Bergamo in 1848. Among modern Italian composers, D. is reckoned to be nearest to Rossini, whose style he imitated during the first stage of his career. D.'s music is praised not so much for melody as for dramatic truth and solidity of execution.

DON'JON, or DUNGEON, the principal tower or keep (q.v.) of a castle (q.v.) or fortress. It was so called either from being placed on a *dun* or elevation, natural or artificial, or because, from its position, it dominated (Lat. *dominio,* corrupted into *domgio, dongeo*) or commanded the other parts of the fortress. From the circumstance that the lower or under-ground story of the donjon was used as a prison, has come the modern meaning of the word. See CASTLE.

DON JUAN is a legendary and mythical personage like Dr. Faustus. The two have been made the representatives of two different tendencies, both proceeding from the same principle—from the principle, namely, of unbelief and godlessness, which necessarily turns self into either a god or a beast—the principle of subjectivism, or selfishness become dominant. In Faust, expression has been given to the subjective idealism of the Germanic nations, their tendency to subtle speculation and a rationalism antagonistic to faith. In D. J. appear the practical materialism and refined sensualism of the Romanic peoples, and the tendency of blind belief in a corrupt catholicism to pass into unbelief.

Although Faust and D. J. have thus the same source and the same termination, yet, as they proceed from opposite poles, they stand in contrast to each other, and, as was natural, have found different vehicles of expression—Faust in poetry, D. J. in music. The ideal of the D. J. legend is presented in the life of a profligate who gives himself up so entirely to the gratification of sense, especially to the most powerful of all the impulses, that of love, that he acknowledges no higher consideration, and proceeds to murder the man that stands between him and his wish, fancying that in so doing he had annihilated his very existence. Partly in wanton daring, partly to allay all uneasy misgiving, he then challenges that spirit in which he disbelieves to demonstrate to him its existence in the only way he holds valid—namely, through the senses. When this actually happens, when the spirit proves its existence and power by animating the marble statue which he had, with daring mockery, invited as his guest, and summoning him to the final tribunal, compels him to acknowledge the supremacy of spirit, and the worthlessness of a merely sensuous, godless, and immoral existence, it is all over with him, he is crushed, and sinks into hell.

This ideal career is aptly enough localized in one of the most luxurious cities of the once world-monarchy of the Saracens—viz., Seville—and the characters wear the names of the ancient noble families of the place. The hero of the story, D. J., is described as a member of the celebrated family Tenorio, and is represented as living sometimes contemporary with Peter the cruel, sometimes with Charles V. The chief aim of his sinful career is the seduction of the daughter of a governor of Seville, or of a nobleman of the family of the Ulloas. Being opposed by the father, he stabs him in a duel. He then forces his way into the family tomb of the murdered man, within the convent of San Francisco, causes a feast to be prepared there, and invites the statue which had been erected to his victim to be his guest. The stone guest appears at table as invited, compels D. J. to follow him, and, the measure of his sins being full, delivers him over to hell. At a later period, the legend came to be mixed up with the story of a similar profligate, Juan de Maraña, who had in like manner sold himself to the devil, but was at last converted, and died as a penitent monk in the odor of sanctity.

The genuine legend of D. J. was first put into form by Gabriel Tellez (Tirso de Molina), in *El Burlador de Sevilla y Convivado de Piedra*. This drama was transplanted to the Italian stage about 1620, and soon found its way to Paris, where numerous versions of it, among others Molière's *Festin de Pierre* (1669), made their appearance. It was brought on the English stage by Shadwell under the title of *The Libertine* (1676). In the end of the 17th c., a new Spanish version of Tellez's play was prepared by Antonio de Zamora, and brought on the stage. It is this version that forms the groundwork of the later Italian versions and of Mozart's opera. It was first put into an operatic form by Vincenzo Righini in *Il Convitato di Pietra* (1777); the text of Mozart's *Don Giovanni* was written by Lorenza da Ponte (1787). Through this famous opera the story became popular all over Europe, and has since furnished a theme for numbers of poets, playwrights, and writers of romance. A. Dumas has a drama, *Don Juan de Maranna;* Byron's *Don Juan* follows the name, and in so far the character of the original; and Prosper Mérimée's novel, *Les Ames du Purgatoire, ou les Deux Don Juan*, is founded upon it.

DONNE, JOHN, D.D., the son of an eminent merchant, cadet of an ancient family in Wales, was b. in London in 1573. His parents were Catholics, and he was educated in that faith. At the age of 11, he went to Oxford, where he remained three years; thereafter, he removed to Cambridge. Although he greatly distinguished himself at these seats of learning, the faith of his parents prevented him from taking a degree. At the age of 17, he entered Lincoln's inn, to read for the bar; and while so engaged, he carefully studied the principal points in dispute between Catholics and Protestants, and finally joined the latter. About this time, he wrote several of his minor poems, the erotic heat of which contrasted strangely with the austerity of his later years. In 1594, he went abroad, and lived for three years in Spain and Italy. On his return, he was made secretary to Lord Ellesmere, then lord keeper of the great seal. Here he fell in love with that nobleman's niece, and they were privately married. When the union was discovered, D. was imprisoned by his enraged father-in-law. After his liberation, he recovered his wife by legal process, and, without settled employment, went to reside at the house of sir Francis Wooley, a kinsman of his wife. After the death of sir Francis, he removed to London, and lived with sir Robert Drury, in Drury lane. With sir Robert he went to Paris; and on his return, at the instigation of James I., who was delighted with the *Pseudo-Martyr*, a book which D. had written against the Catholics, he entered holy orders. He was made D.D. by the university of Cambridge; and after accompanying an embassy to the queen of Bohemia, he was made on his return dean of St. Paul's, and vicar of St. Dunstan's. A fever carrried him off in 1631. His life has been written by Izaak Walton—forming one of the group of "lives" so praised by Wordsworth in a celebrated sonnet.

D.'s works consist of satires, elegies, religious poems, complimentary verses, and epigrams: they were collected and published by his son in 1650. An earlier but imperfect collection appeared in 1633. D. is usually considered as the first of a series of poets of the 17th c., who, under the infelicitous name of the metaphysical poets, all a con-

spicuous place in English literary history. The directness of thought, the naturalness of description, the rich abundance of genuine poetical feeling and imagery, now began to give way to cold and forced conceits, and elaborate exercises of the intellect. Yet it is generally acknowledged that, amid much rubbish, there is not a little real poetry, and that of a high order, in Donne. His fancy was rich and subtle, his wit singularly keen and poignant, and his word-painting such, that, if he had possessed, in addition, music and sensibility, he would probably have enjoyed a perpetual popularity.

DON'NYBROOK, or ST. MARY'S OF DONNYBROOK, a village and parish in Dublin co., Ireland; now included in Pembroke, a western suburb of Dublin. The parish contains the villages of Donnybrook, Irishtown, Merrion, Ringsend, and Sandymount. The village of Donnybrook was long noted for its fair (begun under king John), kept up for half the month of August every year. In later times the fair lasted only a week. It was long notorious as a season of debauchery and fighting, and in 1855 was finally abolished.

DON QUIXO'TE. See CERVANTES.

DOO, GEORGE THOMAS, one of the best English historical engravers of the present day, was b. in the parish of Christ Church, Surrey, Jan. 6, 1800. He has made himself best known by his famous plate of "Knox Preaching before the Lords of the Covenant," after Wilkie; while his admirable rendering of Eastlake's "Italian Pilgrims coming in sight of Rome," his exquisitely finished heads of women and children, after Lawrence, his engravings from Raffaelle, Correggio, and others, have succeeded in winning for him a very high place in the estimation of the admirers of his laborious art. In 1851, he was elected a fellow of the royal society, and, in 1856, a royal academician. He was appointed chairman of the engravings committee of the London international exhibition of 1862. In 1864, he completed, after eight years' work, a large engraving of the "Raising of Lazarus," by Sebastian del Piombo.

DOOBOV'KA, a t. on the Volga, in European Russia, government of Saratof; 180 m. w. of Saratof city; pop. '67, 13,676. The town has a number of manufactures, and an important river traffic,

DOOLY, a co. in s.w. Georgia, on Flint river; 530 sq.m.; pop. '70, 9,790—4,855 colored. The land is fertile, but much of it is occupied by pine forests. The chief productions are corn, cotton, and molasses. Co. seat, Vienna.

DOOM, the old name given to the last judgment, and to those representations of it in churches which have a religious rather than an artistic object. Many of the dooms are executed in distemper. In the reign of Edward VI. most of them were washed over, or otherwise obliterated, as superstitious. There is a fine one still remaining in the church of the Holy Trinity at Coventry.

DOOM or DUM PALM (*Hyphæne Thebaica*), a species of palm remarkable for the repeated forkings of its stem. It is a native of upper Egypt and of the central parts of Africa. In some districts, it is the most plentiful tree, sometimes even forming forests, sometimes growing amidst the very sands of the desert. Its leaves are fan-shaped. Ropes are made of the fiber of its leaf-stalks. Its fruit is about the size of an orange, but of a somewhat elongated irregular shape; the outer skin is red, and this being peeled off, a considerable thickness of a spongy dry substance is found within it —also part of the *pericarp*—which has an insipid sweetness, and a remarkable resemblance to gingerbread, so that the tree is sometimes called the GINGERBREAD-TREE. This substance is used as an article of food, and an infusion of it as a beverage. The infusion is cooling, gently aperient, and very salutary in fevers. The albumen of the seed is hard and semi-transparent, and is turned into beads and other little ornaments. Each fruit contains one seed. Egyptian bdellium (see BDELLIUM) is said to be an exudation of this palm.

DOOMSDAY BOOK. See DOMESDAY BOOK.

DOOMSTER. See DEEMSTER.

DOON, a Scotch river, rising in the s.e. of Ayrshire in Loch Enoch. It runs n.w. through Loch Doon (5 m. by ¾ m., amid treeless mountains), past Dalmellington, Burns's monument, and Alloway kirk, to the firth of Clyde, 2 m. s. of Ayr. It is 30 m. long. On leaving Loch Doon, the river flows through Glen Ness, a huge rocky and wooded ravine, not surpassed in picturesque beauty by any similar scenery in Scotland. On an islet in the loch are the ruins of Doon castle, where Edward, brother of Robert Bruce, is said to have lived. Burns has immortalized the D. in song.

DOOR AND DOORWAY, in art. The form of the doorway is determined by the architectural style of the building in which it is placed. In classical buildings, it is generally rectangular in form, though both Greeks and Romans, following the Egyptians, amongst whom the practice was almost universal, occasionally diminished the opening towards the top; and the Romans, in later times, very frequently threw over it the circular arch, which was the characteristic feature of their style. Egyptian doorways are known to us, for the most part, only by the examples which remain in monumental structures; and these, like the other members of the style as thus exhibited, are of gigantic proportions. The doorway of the temple at Edfu measures 74 ft. to its summit, but the lintel and cornice which cover it are so deep and massy as to occupy a space of no less than

23 ft., so that the height of the aperture is only 51. With the Egyptians, the doorway was an architectural object of very great importance. On either side of it, colossal statutes or obelisks were placed, and the approach to it was often lined with rows of gigantic sphinxes.

The Greek doorway was surrounded by moldings, and as the lintel or top-stone which covered it projected on both sides beyond the jambs, the moldings which ran round both jutted out at the place of meeting, forming a sort of shoulders, as in a doorway of Erechtheium. This arrangement, however, was by no means uniform, the moldings of the jambs being frequently quite separated from those of the architrave. The doors themselves, in antiquity, in private dwellings, were generally of wood; and in structures devoted to religious or public purposes, of metal, and occasionally of marble. They were generally paneled, and turned on pivots working in sockets. With the exception of the forms of the windows, and the tracery and foliage of the pillars, doorways are the most characteristic feature in all the styles of Gothic architecture. In the earliest, which we in this country are in the habit of calling Saxon, and which on the continent is commonly known as Romanic, they are of course very plain. There is seldom more than a few simple moldings, surrounding a semicircular arch, and in some of the earliest examples, the head of the opening is covered by two flat stones, leaning upon each other in the center, and their other ends being placed on the imposts, so as to form a triangle. In the Norman style, they become gradually more ornamental. The arch still continued in general to be semicircular, though there are a few instances of the segmental or horse-shoe arch. As the style advanced, the moldings and enrichments became more various. Of these, that which is most characteristic of the style is the zigzag molding. Circular or octagonal shafts were now frequently placed in the jambs, and these, too, were often ornamented with zigzag or spiral moldings, their capitals being enriched with foliage or grotesque heads or figures. The opening of the doorway often does not rise higher than the springing of the arch, and in this case it is generally flat, the semicircular space between it and the arch being frequently ornamented with a sculptured representation of some scriptural subject. The few Norman doors that exist are devoid of ornament, with the exception of projecting nails, and a simple iron scroll-work projecting from the hinge, and stretching to a greater or less extent over the door. As the doorway adheres strictly to the characteristics of the style, early English doorways of course generally terminate in pointed arches. In these the moldings are more numerous, the jambs contain a greater number of small shafts, some of which occasionally stand quite free, and on the whole the work is richer in form, and more finished in execution. The opening of the doorway is now frequently divided into two, either by a single shaft or a clustered column. In the decorated style, the doorways are not in general so deeply recessed as in the early English; and this circumstance takes from them in richness more than they gain in elegance by their greater height, and by the more delicate character of their ornamentation. In these, the moldings are commonly enriched with flowers or foliage, either in running patterns or placed separately at short intervals. Of these, the commonest are the ball-flower (q. v.), and a flower of four leaves, which often projects boldly, and produces a fine effect. The iron scroll-work on the doors resembles that in the former style, except that the terminations are more frequently worked into leaves or flowers. In other cases, the doors are paneled, and covered with characteristic tracery. In the perpendicular style, though the door continues to be arched, it is usually placed under a heavy square external molding. The doorway in this style loses much of the depth and richness which belongs to it in the earlier styles which we have been considering. Shafts are still used in the jambs, though not always, and they are generally small and few in number; the capitals of the jambs rarely possess the same richness of foliage, and frequently consist merely of plain moldings. One or more large hollows are often left in the jambs, forming small niches, which frequently contain statues. This latter characteristic seems to be peculiar to the perpendicular style. In the door ways, as well as in the windows of this style, the four-centered arch came into general use, but two-centered arches, and, in small doorways, ogees, are frequently to be met with. The doors in the perpendicular style, when ornamented, are usually paneled, the upper parts being sometimes covered with tracery, but the fine iron scroll-work of the earlier styles had entirely disappeared.

DOOR, the movable panel by which the opening to an apartment, closet, or passage is closed. Doors are made of wood, iron, bronze, or stone. When moving horizontally on hinges, they are called *swing*-doors; when two such are used to close one opening, they are *folding*-doors. *Sliding*-doors are those which move on rollers, and may be pushed aside. A *jib*-door is one which is concealed as much as possible when shut. A *trap*-door is one which opens vertically over a horizontal opening, as a hole in a floor, etc. When a small door closes an opening cut in a larger one, it is usually called a *wicket*.

Doors are commonly made of wood, and these we shall first describe. The most simply made door is constructed of several boards joined together at their edges by a *rebate*, or a *plowed and tongued groove* (see CARPENTRY); these are held together by a transverse piece simply nailed to each board; this is called a *ledge*, and the door thus made, a *ledge*-door. These are commonly used for workshops, stabling, etc.;

but when durability and appearance are to be combined, a stout frame is first made, its parts joined together by mortise and tenon. See CARPENTRY. This frame has one or more openings—usually four—which are filled with thin pieces called *panels*, fitted into grooves plowed in the edges of the frame. The horizontal pieces of the frame are, according to their position, called the top-rail, bottom-rail, lock-rail, and frieze-rail. The lock-rail is that to which the lock is fixed, the frieze-rail intermediate between the middle and top-rail in large doors. The extreme vertical parts of the frame to which the rails are fixed are called *stiles*, and the intermediate vertical part, a *mounting*. Doors are named one, two, four, six, etc., paneled doors, and are further described by the kind of molding which surrounds the panel, and from the description of panel. The main object of framing, besides appearance, is to counteract the tendency of the wood to warp, by binding the different parts together with pieces having their fibers at right angles to each other.

In many old buildings, the outer, and even some inner doors are made of massive oaken planks, bound together with ornamental iron straps. Iron doors are chiefly used to intercept fire. For this purpose, they are best made of wrought iron, with double sides. Bronze doors are sometimes used for churches and other large buildings. They are usually ornamented with castings in high and low relief. Those of the baptistery of the cathedral of Florence, by Ghiberti, and the pantheon of Rome, are among the most celebrated examples. A few examples of marble doors exist, chiefly in cemeteries and some Belgian churches.

DOOR, a co. in n.e. Wisconsin, between Green bay and lake Michigan; 625 sq.m.; pop. '75, 8,020. Agriculture is the chief business. Co. seat, Gibraltar.

DOO'RA. See DURRA.

DOOR-KEEPER, in the senate and house of representatives of the federal congress, and in the corresponding bodies in state legislatures, an officer chosen by vote of the body who has general charge of the rooms. He announces messages from presidents, governors, or the co-ordinate legislative bodies; attends to the dispatch of documents, and assists the sergeant-at-arms in keeping order.

DOORN, in English, *thorn*, is a common name in s. Africa. It indicates various communes in the Cape Colony. It also designates two rivers, distinguished as *Great* and *Little*, both of them joining the Olifant, or Elephant, on the right, but the smaller from the s.e., and the larger from the north-east.

DOORN'BOOM, *Acacia horrida*, the most common tree in the wastes of s. Africa. The name D. (*thorn-tree*), given to it by the Dutch colonists, and the botanical specific name, are due to the number and sharpness of its spines. It seldom much exceeds 30 ft. in height, but its timber is hard and tough, and is much used for house-carpentry, etc. See ACACIA.

DOOS'TEE, a river of Beloochistan, running s. through the entire country, and falling into the Arabian sea. It is about 900 m. long.

DOQUET, or DOCKET (from the same root as *dock*, to cut off or clip), a small piece of paper or parchment, containing a brief or summary of a large writing. All attestations or declarations annexed to written instruments are called doquets, more particularly those that are done by a notary. The notarial D. is said to be the most ancient example of fixed style in Europe; and though latterly appropriated to the instrument of sasine, it was formerly common to all solemn instruments. It consisted of a Latin attestation, holograph of the notary, annexed to the notarial instrument prepared by him. The name of the notary was set forth, and the authority mentioned, by which he had been appointed to be a notary. In the case of an instrument of sasine, it stated that he was personally present with the witnesses; that he saw, knew, heard, and noted the circumstances mentioned in the sasine; that he prepared the instrument, and the number of pages it contained. In addition to his subscription, the notary was formerly in use in Scotland to add his *signum*, which was a flourish of the pen, called a paraph or ruck. Latterly, he only subscribed the document on each page; and on the last page, opposite to the D., he added to his subscription the motto which he had assumed on his admission as a notary. The notarial D. of instruments of sasine was superseded by 8 and 9 Vict. c. 35, s. 5.

DOR. See DUNG BEETLE.

DOR, or MONT DOR (often written less properly Mont d'Or), a chain of mountains in France comprised in the great group of the Auvergne (q.v.) mountains in the department of Puy-de-Dome. They are clearly of volcanic formation, and rise in the Puy-de-Sancy, which is the highest peak of central France, to the height of 6,190 feet.

DORA D'ISTRIA. See GHIKA HELENA, *ante*.

DORAK', a t. of Persia, in the province of Khuzistan, situated on a marshy plain at the junction of the D. with the Jerrahi. It is surrounded by a mud-wall, and defended by a fort. By a canal which unites the D. with the river Karun, a considerable trade is carried on. D. is also reported to have thriving manufactures. Pop. 6,000.

DORAN, JOHN, PH.D., a copious contributor to miscellaneous literature, descended from an old Irish family of Drogheda, was b. in London in 1807. In early life he resided in France and Germany, and was chiefly educated by his father. So early as 1822, he produced the melodrama of *The Wandering Jew*, and at the age of 20 became the editor of the *Literary Chronicle*. In 1835, he wrote a history of Reading, but from that time till 1854, he confined his labors to the periodical press. In the latter year he published *Habits and Men*, followed by *Table Traits and Something on them*. *Lives of the Queens of England of the House of Hanover* appeared in 1855; *Knights and their Days*, in 1856; *Monarchs retired from Business*, in 1857; *History of Court Fools*, in 1858; *New Pictures and Old Panels*, in 1859; *The Princes of Wales*, in 1860; and a *Memoir of Queen Adelaide*, in 1861. In 1864, he produced *Their Majesties' Servants*, a history of the stage from Betterton to Kean; in 1868, *Saints and Sinners;* and in 1873, his most interesting work, an account of Mrs. Montague and the "blue stockings" of her day, under the title of *A Lady of Last Century*. In 1876, he published *Mann and Manners*, the letters of sir Horace Mann to Horace Walpole. His last work, *London in Jacobite Times*, appeared in 1877. Besides being a large contributor to miscellaneous literature, Dr. D. several times edited the *Athenæum*, and at his death, 25th Jan., 1878, he was editor of *Notes and Queries*.

DORCAS SOCIETY, the name given to an association of ladies who supply clothes to necessitous families. The name is taken from Acts ix. 39: "And all the widows stood by him weeping, and shewing the coats and garments which Dorcas made, while she was with them."

DORCHESTER, a co. in s.e. Maryland, on Delaware and Chesapeake bays, intersected by the Delaware and Dorchester railroad; 640 sq.m.; pop. '70, 19,458—7,556 colored. Productions, wheat, corn, etc. Co. seat, Cambridge.

DORCHESTER, a co. in Canada, bordering on Maine, and drained in part by Chaudière river. Pop. '71, 17,779.

DORCHESTER, a parliamentary and municipal borough, the co. town of Dorsetshire. It has a considerable trade in ale and beer, and sends much butter to London. Pop. '71, 6,915. It sends one member to parliament. D. was the Roman *Durnovaria* or *Durinum*, a walled town with a fosse, and a chief Roman British station. Parts of the wall, 6 ft. thick, remained till 1802. Near D. are the remains of the most perfect Roman amphitheater in England, 218 by 163 ft., and 30 ft. deep, the seats rising from the arena, cut in the chalk, and capable of holding 13,000 spectators. There is also a Roman camp with a ditch and high vallum. Near D. is a large British station with three earthen ramparts, a mile and a half in circuit, and pierced by intricate passages, and inclosing barrows. The inner rampart is 60 ft. high. Here, in 1685, judge Jeffreys, in his "bloody assize," sentenced to death, in two days, 109 persons implicated in Monmouth's rebellion.

DORCHESTER, formerly accounted a separate city of Massachusetts, U. S., was in 1870 annexed to the city of Boston. The fortification of Dorchester heights, in 1776, compelled the evacuation of Boston.

DORCHESTER (*ante*), formerly a t. in Norfolk co., Mass., but now the 16th ward of the city of Boston; pop. '75, 15,788. The locality was settled by Puritans from Dorchester, Eng., under the lead of the Rev. John White, who landed at Nantasket, June 11, 1630. The codfishery, so important to New England, originated in Dorchester, and there was erected the first mill in America driven by water-power. Large portions of this district are exceedingly attractive, with beautiful suburban residences.

DORDOGNE, a river rising in s. central France, running w. through the departments of Corrèze, Lot, and Dordogne, and falling into the Garonne, 13 m. n. of Bordeaux; about 220 m. long, and navigable for 150 miles.

DORDOGNE, a department in the s.w. of France, formed of the ancient province of Périgord, with small portions of Limousin, Angoumois, and Saintonge. Area, 3,531 sq.m. Pop. '76, 489,848. The surface is for the most part hilly, and covered with broom and underwood, with here and there a valley of extraordinary beauty and fertility, inclosed with hills, the sides of which are generally clothed with vineyards. There is a great deficiency of corn, but the want, as an article of food for the inhabitants, is supplied to some extent by the immense produce of the chestnuts, which, with the walnut and the oak, are the prevailing trees in the forests. The climate is generally mild. Mines of coal, iron, and manganese are worked; marble, alabaster, and millstones are quarried. The manufactures are coarse woolens, hosiery, brandy, oil, paper, etc. D. carries on considerable trade in iron, wine, hams, and truffled turkeys. It has five arrondissements—viz., Bergerac, Nontron, Périgueux, Ribérac, and Sarlat, with Périgueux as capital.

DORDRECHT. See DORT.

DORÉ, PAUL GUSTAVE, a French artist of great and versatile power, was b. at Strasburg in 1832. He was educated at Paris, and very early gave indication of superior ability. His first attempts were sketches, contributed to the *Journal pour Rire* and others of the Paris periodicals. In 1855, he exhibited his picture of the "Battle of the

Alma," which was followed by the "Battle of Inkerman" in 1857. In this year he first became heard of in England by the reissue of his illustrations of the legend of the "Wandering Jew," the power of weird and grotesque imagination displayed in which could not fail to arrest attention. The success of this work might seem to have determined the future career of the artist, who has since chiefly worked as an illustrator. His productiveness in this field is amazing. He has illustrated editions of *Rabelais*, of the *Contes Drolatiques* of De Balzac, of Dante's *Divina Commedia*, of *Don Quixote*, of Lafontaine's *Fables*, of Milton, and of the Bible—all of which bear the impress of D.'s original genius. He has has also illustrated Tennyson's works, Coleridge's *Ancient Mariner*, the *Legend of the Wandering Jew*, and a tour in Valencia, besides executing a vast mass of miscellaneous work. He has from time to time reproduced and exhibited in Paris and London many of his designs. The "Dore Gallery," used for this purpose, has been open in London for several years. "Christ leaving the Prætorium" is his most important painting. The slightest of D.'s productions shows that he is at once artist and poet, and excites a greater interest than many works more free from hastiness and mannerism. In 1861, D. received the decoration of the legion of honor.

DO'RIA, ANDREA, a noble Genoese, and one of the greatest admirals of his age, was b. at Oneglia in 1468. At an early age, he took service in the guard of the pope, Innocent VIII., and afterwards distinguished himself in the battles which the Milanese and the French fought against Genoa and the kings of Aragon. It was D. who, in 1503, after a short campaign, crushed the rebellion in Corsica. When Genoa, in 1513, got rid of the French domination, D. was appointed capt.gen. of the galleys, in which capacity he carried on a war of extermination against the dangerous swarms of African pirates who infested the Mediterranean. During the war between Francis I., king of France, and Charles V., emperor of Germany, and king of Spain, D. commanded the French fleet, reinforced by his own galleys, and inflicted everywhere severe losses upon the enemy. After the defeat of Francis I. near Pavia, D. accepted the command of the papal fleet; but upon the return of the king from his captivity, entered once more the French service, with the title of high-admiral of the Levant. He blockaded Genoa, for having espoused the cause of the emperor, and putting to flight the party of the Adorni, took the town. On finding the independence of his country threatened by the French, D. with his whole force went over to the emperor, and by so doing hastened the deliverance of Italy from French domination. In 1529, D. entered Genoa without resistance, and refusing the title of sovereign, which was offered by the emperor, established there a popular form of government, which remained in vigor up to the end of the republic. The grateful country decreed him the title of "Father of Peace;" and the emperor, in whose service D. continued, conferred upon him the order of the golden fleece, together with the principality of Melfi. In 1532, D. won a decisive victory over the Turks near Patras, and the conquest of Tunis (1535) was chiefly his work. He took part in the joint expedition against the Turks under Barbarossa in 1539, and in another against Algiers in 1541, where he lost 11 of his own galleys. The tranquillity of his last years was disturbed by the conspiracy of Fieschi. D. took fierce revenge upon the conspirators for the death of his nephew Gianettino. D. died without offspring, in 1560, at Genoa, in his 93d year.

DO'RIANS, one of the four principal peoples of Greece, who took their name, according to the legend, from Dorus, the son of Hellen, who settled in Doris; but Herodotus says that in the time of king Deucalion they inhabited the district Phthiotis; and in the time of Dorus, the son of Hellen, the country called Histiæotis, at the foot of Ossa and Olympus. But the statement of Apollodorus is more probable, according to which they would appear to have occupied the whole country along the northern shore of the Corinthian gulf. Indeed, Doris proper was far too small and insignificant a district to furnish a sufficient number of men for a victorious invasion of the Peloponnesus. In this remarkable achievement they were conjoined with the Heracleidæ, and ruled in Sparta. Doric colonies were then founded in Italy, Sicily, and Asia Minor. Strikingly as all the four nations of Greece differed from each other in language, manners, and form of government, the D. in particular differed from the Ionians. The former preserved a certain primitive solidity and earnestness, but with it something coarse and hard. See O. Müller's *Die Dorier* (2 vols., Breslau, 1824; 2d ed. 3 vols, 1844). The *Doric dialect* bore the same character; it was harsh and rough, while the Ionian was soft and polished, yet the former had something venerable from its antiquity, and was therefore employed in hymns and choruses. In philosophy, the influence of the Doric character was particularly visible in the Pythagorean school and its attachment to the aristocracy. It is no less traceable in architecture in the the strong unadorned Doric pillars, which form so marked a contrast to the slender and decorated Ionian columns.

DOR'IC ORDER. The oldest, strongest, and simplest of the three orders of Greek architecture. See COLUMN, ENTABLATURE, GREEK ARCHITECTURE.

DO'RIS, a genus of gasteropodous mollusks of the order *nudibranchiata*, the type of a family called *doridæ*, and sometimes popularly SEA-LEMONS. The body is oval, the abdomen flat, the back flat in some and elevated in others, the mouth a small proboscis with two small tentacula, the vent situated in the back, and surrounded by a

circle of branched or plumed gills. The species are found in all seas, many in those of Britain; but they are more numerous in the southern hemisphere. Some of them attain a considerable size. Few of them inhabit deep water. They crawl on rocks, sea-weeds, etc., where they are often left by the tide, or swim in a reversed position; the foot, made concave by muscular action, serving to buoy them up. Some of them are pretty and interesting inmates of the aquarium. Gosse mentions, that specimens of *D. bilamellata* were "very social in confinement, continually finding out one another, and crawling close up together."—*A Naturalist's Rambles on the Devonshire Coast.*

DORIS, a small mountainous district of ancient Hellas, between Phocis, Ætolia, Locris, and Thessalia, was the earliest home of the Dorians. With its four towns, Boium, Cytinium, Erineus, and Pindus, it formed the Doric Tetrapolis, which was afterwards completely destroyed by the Macedonians, Ætolians, and other nations, so that at the time of the Romans, only a few remains of these towns were visible.—D. was also the name of a district in Asia Minor, on the coasts of Caria, inhabited by colonists from the Peloponnesus; it formed a *hexapolis.*—In modern Greece, D. forms an eparchy of the government of Phocis.

DORKING, or DARKING, a t. in England, in the middle of Surrey, stands in a picturesque valley on the left bank of the Mole, 23 m. s.w. of London by road. It lies on the Roman road which ran between London and Chichester. Pop. '71, 5,419. Its chief trade is in flour, lime, and chalk from the adjacent pits. D. gives its name to a peculiar breed of domestic foul. See POULTRY.

DORMANT (Fr. sleeping). In heraldic representation, an animal dormant has its head resting on its forepaws, whereas an animal couchant has its head erect.

DORMANT VITALITY is a term used to designate a peculiar condition which is manifested by many organized beings, and which is characterized by an apparent suspension of all the vital actions. Beings in this state can scarcely be said to be *alive*, since they exhibit no vital activity, nor can they be designated as *dead*, since that implies their incapability of resuming their former state; hence, since they retain their peculiar attributes without manifesting them, the term D. V. seems the most appropriate for them. This condition may result either from the withdrawal of the stimuli necessary for the maintenance of vital actions (as water, heat, etc.), or it may proceed from some change in the organism itself, whereby its power of responding to these stimuli is for a time diminished or lost. We shall illustrate our meaning by a few striking examples of each kind of dormant vitality.

1. D. V. from the withdrawal of the necessary stimuli.

Seeds deprived of access to air and moisture may retain their vitality for an enormous time. "I have now before me," says Dr. Lindley, "three plants of raspberries which have been raised in the gardens of the horticultural society, from seeds taken from the stomach of a man whose skeleton was found 30 ft. below the surface of the earth, at the bottom of a barrow that was opened near Dorchester. He had been buried with some coins of the emperor Hadrian, and it is probable, therefore, that the seeds were 1600 or 1700 years old." A more remarkable illustration of the vitality of seeds is afforded by a case communicated to Dr. Carpenter, and published in his *General and Comparative Physiology* the facts of which may be shortly stated as follows: In a town in the state of Maine, about 40 m. from the sea, a well was being dug, and at a depth of about 20 ft. a stratum of sand was found, which excited interest, from the circumstance that no similar sand was known to exist nearer than the sea-beach. It was, in the first instance, collected in a heap, but was subsequently scattered about the spot on which the heap had stood. In a year or two, when the very existence of the sand was almost forgotten, it was observed that a large number of small trees were growing up on the ground where it had been strewed. They turned out to be beach plum-trees, and they actually bore the beach-plum, which had never before been seen except immediately upon the sea-shore. These trees had therefore sprung up from seeds which were in the stratum of sea-sand that had been pierced by the well-diggers, and had probably retained their vitality through a period of time beyond the estimation of human calculation—the period, namely, in which the sea had gradually receded 40 m. from its present limits.

Among the lower animals, we find several of comparatively complex structure, in which D. V. can be induced for a considerable period, as, for instance, several years by the abstraction of their *moisture.* The well-known rotifer, the wheel-animalcule, may be reduced to a state of perfect dryness, and kept in this condition for a great length of time (certainly three or four years, and some writers say far longer) without evincing a sign of life, and yet it will immediately revive on being moistened. The *tardigrades,* an allied tribe, have been desiccated by the most powerful means which chemistry affords, and have been then heated to a temperature of 250°, and have still been revived by water, although in their active state a temperature of 120° destroys them. In Woodward's *Manual of the Mollusca,* cases are recorded of living snails crawling out of shells which were supposed to be empty, and in which they must have been dormant for several years, and the eggs of snails and others of the lower animals have a still greater power of revivification after drying. Sir James Emerson Tennent describes various fishes in Ceylon which bury themselves in the mud when the pools or tanks dry up, and remain torpid until the periodic rains of that country ensue, and previous observers

had noted similar facts in other tropical countries. Humboldt relates that crocodiles and boas are sometimes found alive, though torpid, in hardened mud, and revive on the application of water.

A *diminution of temperature* will induce this phenomenon in many animals. In one of capt. sir James Ross' voyages, several caterpillars having been exposed to a temperature of 40° *below zero*, froze so completely that, when thrown in a tumbler, they chinked like lumps of ice. When thawed, they resumed their movements, took food, and became transformed into the chrysalis state. One of them, which had been frozen and thawed four times, subsequently became a moth. In the North American lakes, frozen fishes are often found in the ice, which revive when gently thawed. Spallanzani kept frogs and snakes in a torpid state for three years in an ice-house, and then revived them by warmth. The same capability does not exist, at all events to the same extent, in the warm-blooded animals. A *total* suspension of vital activity in a bird or a mammal for any length of time, from the prolonged application of severe cold, or from any other cause, is never followed by recovery. The stories of certain birds burying themselves in the mud during winter, are regarded by the best authorities as more than questionable; and in hibernating mammals (see HIBERNATION), the suspension is not total. How we are to explain, or whether we ought to believe, the remarkable cases of certain Indian fakirs, who are stated to have the power of suspending all their vital activity for days, or even weeks, we do not know. The late Mr. Braid, of Manchester, published a collection of these cases, directly obtained from British officers who had been eye-witnesses of them in India, in his *Observations on Trance or Human Hibernation*, 1850. We quote one of these, vouched for by sir Claude Wade. The fakir was buried in an underground cell, under strict guardianship, for *six weeks;* the body had been twice dug up by Runjeet Singh (at whose court the exhibition came off) during the period of interment, and had been found in the same position as when first buried. In this and in all the other recorded cases, the appearance of the body when first disinterred is described as quite corpse-like, and no pulsation could be detected at the heart or in the arteries. The means of restoration employed were chiefly warmth to the vertex, and friction to the body and limbs.

2. Dormant vitality from changes within the organism.

The insect world affords us the chief illustrations of this variety of dormant vitality. The pupa or chrysalis stage of insect life is in itself one of dormant vitality, unconnected with any of the external influences which we have been describing. That this stage may be much shortened by artificial heat, and prolonged by artificial cold, has been known since the time of Reaumur; but, as the following case shows, there are other causes inherent in the animal itself, which tend at a certain time to prolong the pupa condition. In the *papilio machaon* there are two generations every year; for the butterfly that comes forth in the early summer lays eggs which rapidly pass through all the phases of insect life, and produce another set of eggs later in the season, whose *larvæ* or caterpillars turn into *pupæ* before the winter. The pupa stage of the first brood (in July) lasts only 13 days, while that of the second brood (which commences in Sept.) lasts 9 or 10 months, the butterfly not appearing until the following June. The difference of temperature is obviously quite insufficient to account for the great diversity between the two periods. Several other similar cases may be found in Kirby and Spence's *Entomology*.

DORMER, or DORMER WINDOW, is a window placed in a small gable rising out of a sloping roof, often made use of for the purpose of enlarging and lighting the attic or garret-rooms of modern houses. It is also popularly known as a storm-window. *Dormers* do not appear to have been invented before the middle of the 14th century.

DORMITORY (Fr. *dormitoire*, from Lat. *dormire*, to sleep), a sleeping apartment in a monastery, or other religious establishment. Dormitories are usually of considerable size, sometimes having a range of cells parted off on each side.

DORMOUSE, *Myoxis*, a genus of rodent quadrupeds, ranked by some naturalists in the family *muridæ* (rats, mice, etc.), and by others in the family *sciuridæ* (squirrels, etc.), being, in fact, a connecting link between the one family and the other. Their habits resemble those of squirrels; the dentition, however, more nearly agrees with that of mice. There are four molar teeth on each side in each jaw: the upper jaw has not the anterior rudimentary fifth molar, characteristic of squirrels. The molars have their summits marked by transverse ridges. There are no cheek-pouches. The ears resemble those of mice. The fore-paws have each 4 toes and a rudimentary thumb; the hind-feet have 5 toes. The fur is very fine and soft. The tail is long, and in the different species exhibits characters variously intermediate between those of mice and squirrels. This genus and the closely allied genus *graphyurus* are remarkable as the only genera of rodents in which there is no cæcum. The species of D. are beautiful little animals, natives chiefly of the s. of Europe. Some species are also found in Africa, and the genus *graphyurus* is entirely African. The only British species of D. is the COMMON D., RED D., or MUSCARDINE (*M. avellanarius*), an inhabitant of woods in some parts of England. It is about the size of a common mouse, with head proportionally large; has a rather pointed muzzle, large prominent eyes, and a flattened tail, thickly clothed with rather long hair; and is of a tawny red color on the upper parts, and white beneath.

It is extremely gentle and easily tamed, feeds on beechmast, acorns, hazel-nuts, grain, etc., and spends the colder parts of winter in a state of torpidity, although in mild weather it wakens up to consume a little of the store of food which, like squirrels, it lays up for that season. Before its hibernation begins, it is generally very fat, nor does it become emaciated by hibernating. It makes a nest of tangled or interlaced herbage opening from above, usually in copse or underwood; and produces about 4 young ones at a birth. It often assumes a remarkable posture in feeding, suspending itself by its hind-feet; more generally it sits upon its haunches, and holds its food in its fore-paws. This species is found in all parts of continental Europe, from the Mediterranean to Sweden.—The FAT D. (*M. glis*) is a larger species, grayish brown, about the size of a rat, with tail very like that of a squirrel, a native of the s. of Europe, where it inhabits forests, leaping from branch to branch with great agility. It is eaten by the Italians, as it was by the ancient Romans, who highly esteemed it, and fattened it for the table in receptacles called *glirария*.—The GARDEN D. (*M. nitela*), common in Europe as far n. as Poland, is frequently found in gardens, and even in outhouses. It is often very destructive of the fruit of wall and espalier trees. It is rather smaller than the fat D., grayish brown, black round the eyes, and has the tail tufted only at the extremity. All the species of D. hibernate; and from this circumstance the name seems to be derived (Lat. *dormio*, to sleep).

DORNBIRN, a t. of Austria, in the n.w. of Tyrol, about 8 m. s. of the eastern extremity of the lake of Constance, is situated on the Lossen, a small mountain stream. The houses are widely scattered. The women of D. are chiefly employed in muslin-embroidery; the men are for the most part carpenters, and are principally engaged in the construction of wooden houses, which are carried in detached pieces to the market-town (Bregenz), and are thence exported. Pop. '69, 8,486.

DORNER, ISAAK AUGUST, D.D., b Würtemberg, 1809; son of a Lutheran minister; studied at Tübingen, and a professor there in 1838. Soon afterwards he was professor of divinity and councilor of the consistory at Königsberg. From 1847 to 1853, he held a chair at Bonn, then removed to Göttingen; and in 1863, was appointed professor of systematic theology and exegesis in the university of Berlin. His best known work is the *History of the Development of the Doctrine of the Personality of Christ.* This and others of his works have been published in English.

DORNICK, DORNIC, DORNOCK, a species of figured linen, for a full description of which see Ure's *Dict. of Arts and Manufactures.* Dornicks were formerly made in considerable quantity at Dornich, or Tournay, in the Netherlands, and hence their name. From this place, the manufacture was probably carried to Norfolk by the Dutch, who emigrated thither during the persecution of the duke of Alva. By a statute, 5 and 6 Ed. VI. c. 24, this manufacture, or "mystery," carried on at Norwich, is carefully protected. All persons except those residing in Norwich or Pulham, are forbidden to carry on the "mystery," under pain of forfeiture of the article, and of the sum of 6*s.* 8*d.* for every six yards so made. By 4 Will. and Mary, c. 5, s. 2 (68), a duty of 10 per cent, in addition to duties previously levied, is laid on all tapestry or dornicks imported, except from France. It is scarcely necessary to add, that these stringent provisions are no longer in observance.

DORNOCH, a royal burgh and co. t. of Sutherlandshire, situated near the entrance to the DORNOCH FIRTH—an inlet of the North sea, running 25 m. inland, and separating Sutherland from Ross-shire. The cathedral stands in the center of the town, and is an object of considerable attraction. It is said to have been begun in the 11th c. by St. Bar, and was enlarged in 1270 by bishop Gilbert Murray. It was burned in 1570, and thereafter partially repaired. In the year 1837, it was to a certain extent restored by the late duchess of Sutherland. It is in the shape of a cross, and is surmounted with a tower and clock spire. The interior is fitted up and used as the parish church. D. was, in olden times, the residence of the bishops of Sutherland and Caithness. The west tower of the bishop's palace stands immediately opposite to the cathedral. Next to it is a handsome building, in the old English style of architecture, for the courts of law and public offices. The town has a neat, clean appearance, and is lighted with gas. It is considered one of the best bathing-places in the north, and has extensive "links," fit for archery, golfing, and other exercises. D. is one of the six northern burghs which send a member to the house of commons. It was constituted a royal burgh by Charles I. in 1628. The last victim in Scotland to the laws against witchcraft was burned here in 1722. Pop. '71, 625.

DOROGH, a t. of Hungary, 20 m. n.n.w. from Debreczin, situated in the midst of a very fertile district. The pop., 8,222 in number, are chiefly engaged in agricultural pursuits.

DOROGOBUSH, or DOROGOBOUGE, a t. of Russia, in the government of Smolensk, is situated on the left bank of the Dnieper, about 50 m. e.n.e. of Smolensk. It is a small town, but pretty, and well built, and has some manufactures. Pop. '67, 7,865. At D., the French under Eugene, in their retreat from Moscow, encountered many disasters.

DOROGO'I, or DOROHOY, a t. in Roumania in the n. part of Moldavia, 80 m. n.w. of Jassy, on the Shiska; pop. 10,000. It has a large transit trade, and several important annual fairs.

DOROSMA, a t. of central Hungary, Little Cumania, 6 m. w.n.w. of Szeged. It contains a Roman Catholic high school. Pop. '69, 9,688.

DORP, a t. in Prussia, in the government of Dusseldorf, 17 m. n.e. of Cologne; pop. '72, 10,690. It has recently grown to importance for manufactures of iron, steel, paper, tobacco, etc.

DORPAT, or DERPT (Russian, *Gurlev;* Esthonian, *Tartolin*), a t. of Russia, in the government of Livonia, is situated on the Embach, here crossed by a fine granite bridge, 150 m. n.e. of Riga, and is built in the form of a semicircle. It consists of a town proper, with two suburbs. Its streets are straight and clean; its houses, which are mostly of one story, are built of brick or wood, have handsome fronts, and are often showily painted. It is the winter residence of the Livonian nobles and gentry. The Domberg hill, at the n.w. extremity of the town, is tastefully laid out in avenues and promenades; its summit, formerly the site of a cathedral, destroyed by fire in 1775, is now occupied by an observatory, the university library, schools of anatomy and natural history, museums, etc. The observatory—one of the most renowned in Europe, and long presided over by the celebrated Struve—possesses a great refracting telescope, presented by the emperor Alexander I. The university, founded in 1632 by Gustavus Adolphus, suppressed in 1656 by the Muscovites, and re-established by Alexander I. in 1802, is also famous. It supports a staff of about 70 professors and lecturers, and is attended by between 800 and 900 students, of every religious denomination, who are taught theology, ethics, law, medicine, natural philosophy, and natural history. German is employed, except for law. It is also the chief school of the Protestant clergy in Russia, and the Reformed synod of Wilna send their students hither. D. has a botanical garden, containing 18,000 plants, some of which cannot be obtained in any other botanical garden in Europe. D. was formerly a walled town, and the ramparts still exist, but have been converted into public walks. The chief employment of the people consists in supplying the wants of those connected with the university. Pop. '67, 20,780.

DORR, THOMAS WILSON, 1805–54; b. R. I.; graduate of Harvard, 1823. He was the leader of a party in 1840–41 whose object was to extend the right of suffrage in Rhode Island, it being much restricted by property qualifications, and otherwise. This party framed a new constitution, which was voted on, Dec., 1841, when it was claimed that a clear majority of the male citizens of the state voted for its adoption. In April, 1842, an election for state officers under this constitution was held, and Dorr was chosen governor. In May the new government undertook to organize and assume full power. They were resisted by the regular state government, and made some show of using force, but there was no actual fighting. Before the close of the month the Dorrites were scattered, and their leader was arrested, tried for treason, and sentenced to imprisonment for life, June 25, 1844. In 1847, he was released under an act of general amnesty, and in 1851, was restored to civil and political rights.

DORRE ISLAND, lying to the n. of Dirk-Hartog island (q.v.), in lat. 25° 10′ s., forms, like its southern neighbor, part of the breast-work of Shark bay, in western Australia. It is 20 m. long.

D'ORSAY, ALFRED GUILLAUME GABRIEL, Count, 1798-1852; a famous leader of society in London and Paris, who was not only the beau ideal of social elegance, but a man of universal intellectual and artistic gifts. Through his mother, by a morganatic marriage, he was a grandson of the king of Würtemberg. When young he served in the French army, and in 1822, while stationed at Valence, on the Rhone, he made the acquaintance of the earl of Blessington and his family, an event which affected the course of his after life. In Dec., 1827, he married lady Harriet Gardner, 15 years of age, the daughter of the earl of Blessington by his first wife. The union was not happy, and was dissolved soon after Blessington's death in 1829. The widowed countess was accompanied to England by D'Orsay, and the two lived in the same house, their residence becoming a resort of the fashionable artistic and literary society of London. The count's charming manner, brilliant wit, and artistic faculty were accompanied by benevolent moral qualities which endeared him to all his associates. He was always a Bonapartist, and naturally hastened to Paris in 1849, all the more readily because his home in London had been broken up through bankruptcy. The countess went with him, but died a few weeks after their arrival. He then endeavored to support himself by painting portraits. Only a few before days his death he was appointed director of fine arts.

DORSE (*Gadus callarias*, or *Morrhua callarias*), a fish of the same genus with the cod, haddock, etc.; plentiful in the Baltic and in other northern seas, but scarcely known on the coasts of Britain. It never attains so great a size as the cod, being seldom more than 2 ft. in length, but much resembles it in form and color, although its color is more variable, from which it has received the name of VARIABLE COD. It is also called the BALTIC COD. It differs from the cod in the greater length of the upper

jaw. It enters the mouth of large rivers. It is in great request on the coasts of the Baltic, being esteemed the best fish of all this family.

DORSET, EARL OF. See SACKVILLE.

DORSETSHIRE, or DORSET, a maritime co. in the s. of England, on the English channel, between Devonshire and Hampshire. Its greatest length is 58 m.; greatest breadth, 40; average, 21; area, 627,265 acres; a third being arable, a ninth waste, and the rest in pasture. The coast-line is 75 m. long, with some cliffs and headlands. St. Alban's Head is 344 ft. high. Portland isle (q.v.) is connected with the mainland by a remarkable formation known as Chesil bank. The surface is uneven and bleak. Chalk downs run along the s. coast, and through the middle of the county nearly from e. to west. The highest point is Pillesden Pen, 934 feet. The chief rivers are the Stour and the Frome. Geologically, D. consists of strata of plastic clay, chalk, oolite, lias, with some weald and greensand. Remains of colossal reptiles have been found at Lyme Regis. The chief mineral productions are the celebrated Purbeck and Portland building-stones, coarse marble, and white china and pipe clays. The climate is mild. The chalk hills or downs are covered with short, fine pasture, on which countless numbers of South-down sheep are fed. The soil is chiefly sand, gravel, clay, and chalk. D. is mainly a pastoral county, producing sheep, cattle, cheese, and butter; but some wheat, barley, hemp, linseed, hops, etc., are raised. Sanfoin is grown on the chalk hills. There are small manufactures of linen, silk, woolens, flax, hemp, buttons, stockings, and ale and cider. D. is divided into 12 poor-law unions, and about 290 parishes. The chief towns are Dorchester, Brideport, Poole, Weymouth and Melcombe Regis, Shaftesbury, and Wareham. D. sends 10 members to parliament, 3 for the county, and 7 for the above towns. Pop., '71, 195,537. The London and Southwestern, and Somerset and Dorset railways run through the chief districts. D. has ancient British and Roman remains, as stone circles, cromlechs, barrows, camps and amphitheater, and 3 Roman stations. There are some remains of 40 abbacies, priories, hospitals, etc. The ruins of Corfe castle, a seat of the Saxon kings of Wessex, are among the grandest in England.

DORSEY, JOHN SYNG, 1783–1818; b. Philadelphia; studied medicine with Dr. Physick, and first became noted as a physician to a yellow-fever hospital. He was a highly accomplished surgeon, and author of *Elements of Surgery* and of various papers on medical subjects.

DORSIBRANCHIATES, worms living in mud or sand, or swimming in the sea, whose respiratory organs are in the form of tufts or branchial appendages along the back or sides. One species, the lob-worm, is greatly prized in Europe for fish bait. The eunice, another species, has been known to reach the length of 4 feet.

DORSTE'NIA. See CONTRAYERVA.

DORT, or DORDRECHT, a t. of the Netherlands, in the province of South Holland, situated on an island formed by the Maas, about 12 m. s.e. of Rotterdam. An inundation in 1421, in which upwards of 70 villages were destroyed and 100,000 people drowned, separated the site upon which D. stands from the mainland. D. is fortified on the s. side, and its position is naturally so strong, that though frequently besieged, it has never been taken. It is one of the oldest towns in Holland, and some interesting historical particulars attach to it. Here, in 1572, the states of Holland, after their revolt from Spain, held their first assembly, and declared the prince of Orange to be the only lawful governor of the country. In 1718–19, the conclave of Protestant divines known as the synod of Dort, met here and condemned the doctrines of Arminius as heretical, and affirmed those of Calvin. (For an account of the questions at issue, see ARMINIUS.) The Gothic buildings in which the synod sat, whose miraculous labors, according to the president's closing address, "made hell tremble," is now used as a public-house, and the particular room in which they met is degraded into a dancing-saloon. Among the principal buildings of D. are a Gothic church with a tall square tower, and containing a beautiful marble pulpit, and the town-hall. The town is traversed by canals, and the Rhine and the Maas afford it great facilities for trade. Large ships can go quite up to the quays. Gigantic wood-rafts, valuing sometimes as much as £30,000 each, obtained from the Black forest and Switzerland, come down the Rhine to D., which has numerous saw-mills; ship-building docks, salt and sugar refineries, bleacheries, and manufactures of tobacco, white-lead, etc. It has also considerable trade in corn, flax, oil, timber, and salt-fish. Pop. '74, 25,823.

DORTMUND, the most important t. of Westphalia, on the Cologne and Minden railway, is situated on the Emscher, 47 m. n.n.e. of Cologne. It is the center of a mining district, with numerous foundries, and the head-quarters of the mining authorities of Westphalia. D. was formerly surrounded by massive walls, but the greater part of these have been removed, and the town is now quite modern in its aspect. Its history goes back into the earliest middle-age traditions, figuring in the time of Charlemagne under the names of Throtmanni, Tremonia, Trotmunde, and Dortmunde. Subsequently it became a free Hanse town, but was ceded to Prussia in 1815, at the congress of Vienna. The town-hall of D. is one of the oldest in Germany. D. is an important railway center, and manufactures railway material on a large scale. Coal and iron are wrought in the neighborhood; and in D. are nearly 50 beer-breweries. Pop. '75, 57,742.

DORY, *Zeus*, a genus of fishes, the type of a family, *zeïdæ*, which is sometimes regarded as merely a group of the great family of *scomberidæ*, but is at least a very distinct group, characterized not only by an oval and much compressed form of body, but also by a protractile mouth. The teeth are feeble. The species of *zeïdæ* are distributed in the seas of all parts of the world, although only three occur on the British coasts, and two of these are very rare (see BOAR-FISH and OPAH). In the D. genus, the general surface of the body is smooth and destitute of scales, but spiny scales or bony shields guard the dorsal and ventral edges. The anterior portions of the dorsal and anal fins are spiny, and are very distinctly separated from the spineless portions; the spines of the dorsal fin are prolonged into long filaments, and the tail-fin is rounded. The British species (*zeus faber*), popularly known as the JOHN DORY, sometimes attains a considerable size: Pennant mentions one which weighed 12 lbs.; but it is seldom seen of much more than 18 in. in length. It is principally found on the southern, and particularly the south-western coasts of England, visiting them, apparently, in pursuit of pilchards; but becomes more rare towards the north. It is highly esteemed for the table, having among modern epicures pretty much the same reputation which it had among those of ancient Rome. It is common in the Mediterranean. The name D. is generally supposed to be properly *dorée* (gilt), and to refer to the prevailing yellowish color and golden luster of the fish; whilst the familiar appellation, *John*, is in like manner derived from *jaune* (yellow), although it has been suggested that it may rather be from the Gascon *jau*, a cock—names signifying cock, sea-chicken, St. Peter's cock, etc., being given to this fish in different languages. The D. has a remarkable dark spot on each side. An idle legend refers these spots to the finger and thumb of St. Peter, and the D. thus disputes with the haddock the honor of being reputed the fish from whose mouth he took the tribute-money. Other species of D., very similar to the European, are found in the seas of other parts of the world—one of them Australian, exhibiting similar dark spots.

DOSITH'EANS, named after their founder Dositheus, who was a companion of Simon Magus, in the 1st c. A.D. Various stories are told of Dositheus; that he claimed to be the Messiah, and that after the death of John the Baptist, he assumed to take the place of that leader. The Samaritan high-priest ordered his arrest, when he took refuge in a cave, and is said to have starved to death.

DO'TIS, or TOTIS, a t. in the n.w. of Hungary, district of Komorn, and 37 m. w.n.w. of Pesth. Between the town proper and its suburb, called *Lake Town*, from its situation on a small lake, are the remains of an old castle, said to have been a favorite residence of Mathias Corvinus, the Hungarian king. D. contains a splendid château, the property of the Esterhàzy family, the gardens adjoining which are laid out in the English fashion. Pertaining to this castle are some very extensive wine-vaults, one of them containing a tun capable of holding 34,700 English gallons. Pop. '69, 9,855.

DOT'TEREL, *Charadrius morinellus*, a species of plover (q.v.), which in summer inhabits the northern parts of Europe and Asia, breeding chiefly in the highest latitudes, and migrates on the approach of winter to the countries around the Mediterranean and those of similar climate. It appears in Britain as a bird of passage, both on its northward migration in spring, and on its southward migration in autumn. Some breed in the mountains both of Scotland and of England, always at very considerable elevations. The D. is about nine inches and a half in its whole length. In summer plumage, the upper parts are of a brownish ash color, the feathers edged with deep red; the cheeks, throat, and a band above the eyes, white; the breast bright rust color, with a white gorget on the upper part of it, bounded above by a blackish line; a conspicuous black patch on the middle of the belly; some of the tail-feathers tipped with white. The D. has become proverbial for stupidity; but the readiness with which it allows itself to be approached seems to be entirely owing to its coming from regions little frequented by man, and it becomes shy and watchful after a little experience. It is much esteemed for the table, and well known in the London market.

DOUAI, or DOUAY, a t. of France, in the department of Nord, situated on the river Scarpe, about 20 m. s. of Lille. It is a dull, lifeless place, but is surrounded with walls, and is strongly fortified. The principal buildings are the churches, the Hotel de Ville, the public library, the museum, a hospital, and the old buildings of the English college. There are several good schools in D., and a great cannon-foundry. The manufactures include lace, tulle, cotton, oil, soap, brushes, iron machinery; and there is an active trade in corn, seed, and linen. Pop. '76, 23,348. D. has existed since Roman times. It was long a bone of contention between the Flemish counts and the French rulers. It passed with the rest of Flanders under the dominion of Spain, but was taken by Louis XIV. in 1667. Marlborough captured it in 1710, but the French re-occupied it after his withdrawal, and were finally confirmed in the possession of it by the peace of Utrecht.—The *English Catholic College* at D., long the sole or chief theological seminary for English-speaking Catholics, was founded by Dr. William (afterwards cardinal) Allen in 1568. By reason of political difficulties with the Spanish authorities, then in possession of the town, the college was transferred to Rheims in 1578; but in 1593, it was again established at D., and there it flourished till the French revolution, when it was broken up. Subsequently it was re-established on a smaller scale by the Benedictine fathers, and is still conducted by them.

DOUAY BIBLE. See BIBLE.

DOUAY, CHARLES ABEL, 1809–70; a native of France; graduate of the military academy of St. Cyr; served in the war in Algiers, and in the Crimea, where he was conspicuous in the attack on the Malakoff. For services in the battle of Solferino he was made gen. of division. In the German war he commanded at Weissenburg, where he was defeated by the crown prince Frederick William, and found dead on the battle-field.

DOUAY, FÉLIX CHARLES, 1818–79; brother of Charles Abel; served as a capt. in the siege of Rome in 1849, and in the Crimean war, where he rose to brig.gen. He was in Mexico with Maximilian, serving as gen. of division. In the Franco-German war, he led the 7th army corps, and was taken prisoner at Sedan. In Paris, he led the 4th army corps against the commune. He was the first to enter Paris, May 21, and saved the Louvre from entire destruction. His latest command was the military district of the Rhone.

DOUBLEDAY, ABNER, b. N. Y., 1819; graduate of West Point, and a civil engineer. In the Mexican war, he served in the artillery, and became capt. It is said that he fired the first gun on the union side in the war of the rebellion, at Fort Sumter, April 12, 1861. He served with honor through the war, and rose to be brevet maj.gen.

DOUBLE CONSCIOUSNESS. Double or divided consciousness has likewise been designated double personality. The term comprehends a group of morbid mental conditions involving some modification in the clearness of the idea of personal identity. Individuals are often encountered with confused notions of the "me" and "not me;" others conceive that parts or properties of their frame belong to another person, or that they are inhabited and ruled by a spirit or entity acting in opposition to their will and interests; and there are others who, at different times and under different circumstances, such as when influenced by, or free from moral or physical stimulation, conceive that they are different persons, and endowed with different qualities and powers. These manifestations, however, do not fully illustrate the state under consideration, which has been described as exhibiting, in some measure, two separate and independent trains of thought, and two independent mental capabilities in the same individual, each train of thought and each capability being wholly dissevered from the other, and the two states in which they respectively predominate, subject to frequent interchanges and alterations. In the most marked or perfect form of this phenomenon, the individual is conscious of the two independent trains of thought, and conceives, in consequence of the apparent independence of these, that he is two distinct persons at the same time. There are few instances of this mental affection on record (see Wigan *On Duality of Mind*, Abercrombie's *Inquiry into Intellectual Powers*, Ellicot in Combe's *System of Phrenology*, 3d edition). A servant-girl, at the period of puberty, gave evidence of double personality for three months. In an advanced stage of the affection, the circumstances which occurred during the paroxysm were completely forgotten by her when it was over, but were perfectly remembered during subsequent paroxysms. She was, for example, taken to church while in her abnormal state. She shed tears during the sermon, particularly during an account given of the execution of three young men, who had described, in their dying declarations, the dangerous steps with which their career of vice and infamy commenced. When she returned home, she recovered in a quarter of an hour, was quite amazed at the questions put to her about the sermon, and denied that she had been in church; but next night, when taken ill, she mentioned that she had been there, repeated the words of the text, and gave an accurate account of the tragical narrative of the three criminals by which her feelings had been so powerfully affected (*Philosophical Transactions*, Edin. 1822). This description assimilates the patient to the class of somnambulists. But such perversions of the faculties generally involve a more palpable and complete duality of mind. The personal identity seems to be lost or impaired. A. B. conceived that he was himself and another person at the same time; he acted as if this belief were sincere, and could not divest himself of the conviction that in his body were two minds or persons suggesting courses of conduct widely opposed. He was certain that his original self, A. B., was a base, abandoned scoundrel, tempting his other, or new, or better self—to whom, it should be noted, was attached the emphatic *Ego*—to commit crimes or acts of which he altogether disapproved. The second person in this duality repelled, struggled with these abominable solicitation, such as that he should commit suicide; and loathed the tempter or first person. This struggle sometimes became real and visible, when the hands, acting under the will of No. 2, or the virtuous and opposing principle, beat and bruised the legs, body, or head, which, it may be presumed, were supposed to belong to No. 1, the vicious or tempting impulse. The object of the one was obviously to inflict pain upon the other. The blows were so severe as to leave marks for days; and when these were adverted to, the answer was, as if from No. 2, "Don't justify him, he deserved it." Such conflicts generally occurred during the night, and the interference of the night-watch was required to part or pacify the combatants.* In this case the manifestations of disease might be attributed to the abstruse but vain philosophical inquiries of the mind during health.

* Fifth annual report, Crichton royal institution, 1844, p. 13.

While it is quite intelligible that habits of protracted self-analysis, or of that abstraction which loses all idea of distinct personality in the act of thinking, or in the subject occuyping attention, may induce such a condition, a more physical explanation has been sought in the alternate morbid activity of different parts of the brain, in the non-consentaneous or independent and alternate activity of the two hemispheres of the brain. which, when acting together, are held to be the organ of the mind in its unity and entireness. Latterly, the views of sir William Hamilton have been brought to bear upon the point; and still more recently, the theory called "unconscious cerebration," which supposes certain impressions to exist unperceived, and to become objects of consciousness only under certain conditions, has been applied to the same purpose; but, in so far as the impairment of the conviction of personal identity is concerned, the problem still awaits solution.

DOUBLE FLAT, a musical character used to lower the note before which it is placed two half-tones.

DOUBLE FLOWERS. See FLOWER.

DOUBLE REFRACTION. If a crystal of pure carbonate of lime, known as Iceland spar, be laid over a printed page, two distinct views of the letters will be seen through the transparent stone. The letters in the two images will have a fainter color than the original, except when the two images overlap. The production of two images in this manner is called double refraction. If the crystal is made to rotate while always in contact with the paper, one of the images of a dot will be seen to rotate, while one remains unmoved. The stationary image is called the ordinary, the moving one the extraordinary image. The rays which form the ordinary image follow the common law of refraction of light. The others have a different index of refraction. Other crystals besides Iceland spar are doubly refractive. For an elaborate demonstration of the causes of this effect, see Lloyd's *Wave Theory of Light*, London, 1873.

DOUBLE SHARP, a musical character the reverse of the double flat.

DOUBLE SHOTTING is, as its name implies, an augmentation of the destructive power of ordnance, by doubling the shot fired off at one time from a gun. Sometimes three shots are fired at once, in which case the piece is said to be "treble-shotted."

DOUBLE STARS. As seen by the naked eye all stars appear to be single, but the telescope shows us that many are double, while it resolves others into several distinct bodies. In some instances telescopes of low power suffice to reveal the separation; others require instruments of the largest kind and very delicate adjustment. The object-glass especially needs to be free from all defects. Sometimes one of the components of a double star may hide another from view, and in other instance, while they are apparently near, they may yet be far from each other in almost the same line of sight. In certain cases, Herschel found that one of the components described an orbit about the other. A star which is single to ordinary vision, but which may be resolved into two stars thus physically related, is called a binary star. The components of the same star are almost invariably of a different color. The colors of some double stars, however, are complementary, producing together white light. Eight of the stars known to be physically double have periods of revolution less than a century, while about 400 appear to have a period of more than 1000 years for this process.

DOUB'LET (so called from being originally lined or wadded for defense) was a close, tight-fitting garment, the skirts reaching a little below the girdle. It was almost identical with the jerkin. The sleeves were sometimes separate, and tied on at the arm.

DOUBLING THE CUBE was a celebrated geometrical problem among the ancients. The object was to find the side of a cube whose content should be twice that of another given cube; and various accounts are given of how the problem was suggested. One legend brings the matter into connection with Delos (hence the name of "the Delian problem"), and relates that the oracle of Apollo in that island, being consulted by the inhabitants during the prevalence of a pestilence, gave for answer, that they should make the altar of Apollo, which was in the form of a cube, as large again. This was done, and yet the pestilence continued; and the oracle being again consulted, replied, that the altar must retain its cubic form, which had not been attended to in the enlargement. This problem perplexed the Delians, as it did mathematicians of after-ages. Even Plato, whom they consulted on the difficulty, could give them no solution, and had recourse, according to the story, to evasion.

The problem, however, is older than Plato; before his time, it had occupied Hippocrates of Chios (not the physician Hippocrates), and was studied afterwards by Eratosthenes, Nicomedes, Hero, and others. Apollonius applied conic sections to the solution of the question, as did also Menæchmus; Nicomedes invented a curve, which he called the conchoid, for the express purpose, and Diocles the cissoid. The analytical method introduced into geometry by Descartes showed this problem in its true light. It was seen to be only a special case of the solution of a cubic equation—a solution which is impossible by geometry, i.e., by the use of the circle and straight line. It may, however, be represented by the intersection of two conic sections, of which one may be a circle. Descartes made use of the parabola with the circle, which is the simplest way. With numbers, the question is merely one of the extraction of the cube

root. If the side of a cube be one foot, its solid content is $1 \times 1 \times 1 = 1$ cubic foot. The side of a cube of double that content, or 2 cubic feet, is $\sqrt[3]{2} = 1.259921$.

DOUBLINGS, the heraldic term for the linings of robes or mantles, or of the mantlings of achievements. See MANTLING.

DOUBLOON (Sp. *dublone*, double) is the name of a gold piece coined in Spain and Spanish America. The dublon de Isabella, coined since 1848, is of 100 reals, and equivalent to 25 84 French francs, or 20*s.* 8*d.* The older Spanish doubloons vary in value from 85 to 81 francs.

DOUBS, a department of France, on the eastern frontier, separated from Switzerland by the Jura mountains, is situated in lat. 46° 35′ to 47° 31′ n., and long. 5° 42′ to 7° 4′ east. Area about 2,000 sq. miles. Pop. '76, 306,094. D. is traversed by the river Doubs, a tributary of the Saone, and is separated, on the n.w., from the department of Haute Saone by the Oignon, also a tributary of the Saone. The surface is hilly, being crossed by four parallel ranges of the Jura mountains. The climate is more rigorous than in most similar latitudes. The pine and the walnut attain a huge size, and the common orchard trees thrive well. Maize, potatoes, hemp, and flax are raised. The pasturage is excellent, and rears good breeds of horned cattle and horses, which are exported. In the valleys, great quantities of butter and cheese are produced. The rivers are well stored with fish. Mines of iron and coal are worked, and gypsum and marble are abundant. The trade is principally in iron, cattle, horses, and dairy produce. D. is divided into the four arrondissements of Besançon, Baume-les-Dames, Montbelliard, and Pontarlier. The capital of D. is Besançon.

DOUCHE. See BATH and HYDROPATHY.

DOUGH is the name given to the moistened and kneaded flour in the first stage of making bread (q.v.).

DOUGHERTY, a co. in s.w. Georgia, on Flint river; crossed by two railroads; 300 sq.m.; pop. '70, 11,517—9,424 colored. It is level and fertile, producing corn, oats, cotton, etc. Co. seat, Albany.

DOUGLAS, a co. in n.e. Colorado, on the Kansas border; traversed by the Kansas Pacific and the Denver and Rio Grande railroads; 4,500 sq.m.; pop. '70, 1388. The bottom-lands are fertile; other parts are more adapted to grazing. Coal and iron are found. Productions chiefly agricultural. Co. seat, Castle Rock.

DOUGLAS, a co in s.e. Dakota, formed after the census of 1870; about 500 sq. miles. It is not yet settled.

DOUGLAS, a co. in n.w. Georgia, formed after the census of 1870. It is on the Chattahoochee river, and has an area of about 300 sq. miles. Cotton and corn are the chief productions, and minerals are found. Co. seat, Douglasville.

DOUGLAS, a co, in e. Illinois, on Kaskaskia and Embarras rivers; intersected by the Chicago division of the Illinois Central railroad; 375 sq.m.; pop. '70, 13,484. It has a level surface and fertile soil, producing corn, oats, wheat, wool, and butter. Co. seat, Tuscola.

DOUGLAS, a co. in e. Kansas, on the Kansas river, intersected by the Leavenworth, Lawrence, and Galveston railroad; 470 sq.m.; pop. '78, 18,971. It is of rolling upland, with a black loamy soil, producing corn, wheat, butter, etc. Co. seat, Lawrence.

DOUGLAS, a co. in. w. Minnesota, reached by the (proposed) St. Paul and Pacific railroad; 720 sq.m.; pop. '75, 6,319. The surface is mostly level, and there are many small lakes. Productions agricultural. Co. seat, Alexander.

DOUGLAS, a co. in s. Missouri, on the upper waters of the White river; 648 sq.m.; pop. 70, 3,915. The surface is hilly, much of it still covered with forests. Lead ore is found. The productions are chiefly agricultural. Co. seat, Ava.

DOUGLAS, a co. in e. Nebraska, on the Missouri river, bounded on the w. by the Platte, traversed by the Union Pacific and the Omaha and Southwestern railroads; 350 sq.m.; pop. '76, 25,722. The soil is fertile, and the surface an undulating prairie. Productions agricultural. Co. seat, Omaha.

DOUGLAS, a co. in w. Nevada, on the California border; 900 sq.m.; pop. '75, 1718. It is a rough region, but embraces the most fertile portion of the Carson valley. There are pine forests in the mountains, and water-power is abundant. Gold, silver, and copper are found, but mining is not prosecuted to any great extent. Productions agricultural. Co. seat, Genoa.

DOUGLAS, a co. in s. Oregon, on the Umpqua river; crossed by the Oregon and California railroads; 5,000 sq.m.; pop '75, 6,033. Productions, wheat, corn, barley, butter, wool, etc. Co. seat, Roseburg.

DOUGLAS, a co., in n.w. Wisconsin, on lake Superior and the Minnesota border; reached by the Lake Superior and Mississippi railroad; 1300 sq.m.; pop. '75, 741. Agriculture is the principal business. Co. seat, Superior.

DOUGLAS, DAVID, 1798-1834; a botanist, native of Scotland. He was employed in the Glasgow botanic garden for a time; then sent abroad as collector of specimens;

for the botanical society of London. In 1824, he explored a great part of Oregon and California, and in 1827, crossed the continent from fort Vancouver to Hudson bay, returning with sir John Franklin to England. In 1829, he visited the Sandwich islands, where, falling into a pit for entrapping wild cattle, he was gored to death by an animal already caught.

DOUG'LAS, the largest t. and principal seaport of the Isle of man, is so called from its being situated near the junction of two streams—the *Dhoo* (black) and *Glass* (gray). D. lies on the margin of a highly picturesque bay, on the e. side of the island. From the excellence of the sea-bathing, and its central position, it is fast increasing in importance as a watering-place. The old town, standing on the south-western edge of the bay, consists of narrow tortuous streets, and presents a vivid contrast to the handsome modern terraces and villas which occupy the rising ground beyond. Lately the erection of a deep-water landing pier has removed the necessity of passengers landing in small boats. A new street from this pier leads through the heart of the old town, a bill, or act of Tynwald, having been passed directing its formation. Conspicuous in the center of the crescent of the bay stands castle Mona, formerly the residence of John, duke of Athol, but now converted into a first-class-hotel. The tower of refuge, a picturesque object, occupies a dangerous rock, in the southern area of the bay, called Conister, and was erected in 1833 for the safety of shipwrecked mariners, by the late sir William Hillary, bart., who, during his residence at D., founded the royal national life-boat institution. D. is the principal packet station of the island, and possesses telegraphic communication with England. Pop. '71, 13,846.

DOUG'LAS, THE FAMILY OF. Archæology has failed in its efforts to pierce the obscurity which veils the origin of the heroic race of which it has been said:

> So many, so good as of Douglas blood have been,
> Of one surname, in one kingrick, never yet were seen.

A legend of the 16th or 17th c. told how, about the year 770, a Scottish king, whose ranks had been broken by the fierce onset of a lord of the isles, saw the tide of battle suddenly turned by an unknown chief; how, when the victory was won, the monarch asked where was his deliverer; how the answer ran in Erse, *Sholto Du-glas* ("Behold that dark-gray man"); and how the warriar was rewarded with that Clydesdale valley which, taking from him its name of Douglas, gave surname to his descendants. This fable has long ceased to be believed. Equal discredit has fallen on the theory which, 60 years ago, the laborious Chalmers advanced in his *Caledonia*, that the Douglases sprang from a Fleming of the name of Theobald, who, between the years 1147 and 1164, had a grant of lands on the Douglas water from the abbot of Kelso. There is no trace of any connection between the Flemish Theobald and the Douglases; nor were the lands which he acquired on one side of the stream any part of their old domain on the other. What was boasted of the Douglases by their historian, two centuries ago, therefore still holds true: "We do not know them in the fountain, but in the stream; not in the root, but in the stem; for we know not who was the first mean man that did by his virtue raise himself above the vulgar." It was thought likely, in the beginning of the 15th c., that the Douglases and the Murrays had come of the same stock, and in this old conjecture all that is known on the subject must still be summed up.

1. *William of Douglas,* the first of the family who appears in record, was so-called, doubtless, from the wild pastoral dale which he possessed. He is found witnessing charters by the king and the bishop of Glasgow between 1175 and 1213. He was either the brother or the brother-in-law of sir Freskin of Murray, and had six sons, of whom Archibald, or Erkenbald, was his heir; and Brice, a monk of Kelso, rose to be prior of Lesmahago (a dependency of Kelso, on the outskirts of Douglasdale), and in 1203 was preferred to the great bishopric of Murray. He owed this promotion, no doubt, to the influence of his kinsmen the Murrays, and it contributed not a little to the rising fortunes of his own house. He was followed beyond the Spey by four brothers, of whom one became sheriff of Elgin; another became a canon of Murray; a third, who had been a monk of Kelso, seems to have become archdeacon of Murray; and a fourth, who had been parson of Douglas, appears to have become dean of Murray.

2. *Sir Archibald, or Erkenbald, of Douglas* is a witness to charters between 1190 and 1232. He attained the rank of knighthood, and beside his inheritance of Douglas, held the lands of Hailes, on the Water of Leith, from the monks of Dunfermline, and had a grant of the lands of Levingston and Hirdmanston from the earl of Fife. He is said to have acquired other lands in Clydesdale by his marriage with one of the two daughters and heiresses of sir John of Crawford.

3. *Sir William of Douglas,* apparently the son of sir Archibald, figures in record from 1240 to 1273. He appears in 1255 as one of the Scottish partisans of king Henry III. of England; and in 1267, is found in possession of the manor of Fawdon, in Northumberland, by gift of the king's son (afterwards Edward I.). He seems to have had a brother, sir Andrew, the progenitor of the Douglases of Dalkeith and Morton, and certainly had two sons.

4. *Hugh of Douglas,* the elder, acquired land in Glencorse, in Lothian, by marriage with the sister of sir Hugh of Abernethy; and dying without issue about 1287, was succeeded by his younger brother.

5. *Sir William of Douglas*, distinguished in the family traditions as *William the Hardy*, had all the daring and restless spirit which was characteristic of his descendants. His first appearance is in 1267, when his head was nearly severed from his shoulders in defending his father's English manor from a foray of the men of Redesdale. Twenty years later, he is found at the head of an armed band, carrying off his future wife, a wealthy widow, Alionora of Lovaine, from the manor of her kinsfolks, the La Zouches, at Tranent, in Lothian. We hear of him immediately afterwards as spoiling the monks of Melrose, deforcing the king's officers in the execution of a judgment in favor of his mother, unlawfully imprisoning three men in his castle of Douglas, and beheading one of them. He was the first man of mark who joined Wallace in the rising against the English in 1297; and for this his lands of Douglas were wasted with fire and sword, and his wife and children carried off by Robert Bruce, the young earl of Carrick, then a partisan of England. But the knight of Douglas soon left the insurgent banners, and submitting to his old patron, king Edward I., to whom he had again and again sworn fealty, was sent prisoner to the castle of York, where he died about 1302. It appears that he possessed lands in one English, and in seven Scottish counties—Northumberland, Berwick, Edinburgh, Fife, Lanark, Ayr, Dumfries, and Wigton.

6. The history of his son, *the Good Sir James of Douglas*, is familiar to every one, as Bruce's greatest captain in the long war of the succession. The hero of seventy fights, he is said to have won them all but thirteen, leaving the name of "the black Douglas" —so he was called from his swarthy complexion—as a word of fear by which English mothers stilled their children. He was slain in Andalusia, in 1330, on his way to the Holy Land with the heart of his royal master, and dying unmarried, was succeeded by his brother.

7. *Hugh of Douglas*, of whom nothing is known except that he made over the now great domains of his family, in 1342, to his nephew *Sir William of Douglas* (son of a younger brother of the good sir James—sir Archibald of Douglas, regent of Scotland, slain at Halidon hill in 1333).

Earls of Douglas.—Hitherto, the Douglases had no higher title than that of knight; but in 1357, sir William of Douglas, who had fought at Poitiers, and distinguished himself in other fields, was made earl of Douglas, and afterwards by marriage became earl of Mar. His ambition aimed at still greater things, and in 1371 he disputed the succession to the Scottish crown with Robert II. (the first of the Stewarts). He claimed as a descendant of the Baliols and Cummings; and his pretensions were abandoned only on condition that his son should marry the king's daughter. He died in 1384. His son James, second earl of Douglas and Mar, the conqueror of Hotspur, fell at Otterburn in 1388; and as he left no legitimate issue, the direct male line of William the hardy and the good sir James now came to an end. His aunt had married for her second husband one of her brother's esquires, James of Sandilands, and through her lord Torphichen is now the heir general and representative at common law of the house of Douglas.

The earldom of Douglas, meanwhile, was bestowed on an illegitimate son of the good sir James—Archibald, lord of Galloway, surnamed the grim. By his marriage with the heiress of Bothwell, he added that fair barony to the Douglas domains; and having married his only daughter to the heir-apparent of the Scottish crown, and his eldest son to the eldest daughter of the Scottish king, he died in 1401. His son and successor, Archibald, fourth earl of Douglas, was, from his many misfortunes in battle, surnamed "the Tyneman," i.e., the loser. At Homildon, in 1402, he was wounded in five places, lost an eye, and was taken prisoner by Hotspur. Next year, at Shrewsbury, he felled the English king to the earth, but was again wounded and taken prisoner. Repairing to France, he was there made duke of Touraine, and fell at Verneuil in 1424. He was succeeded by his son Archibald, who distinguished himself in the French wars, and dying in 1439, was buried in the church of Douglas, where his tomb yet remains, inscribed with his high titles of "duke of Touraine, earl of Douglas and of Longueville, lord of Galloway, Wigton, and Annandale, lieutenant of the king of Scots." His son and successor, William, a boy of sixteen, is said to have kept a thousand horsemen in his train, to have created knights, and to have affected the pomp of parliaments in his baronial courts. His power and foreign possessions made him an object of fear to the Scottish crown; and, having been decoyed into the castle of Edinburgh by the crafty and unscrupulous Crichton, he was, after a hasty trial, beheaded, along with his brother, within the walls of the castle, in 1440. His French duchy and county died with him; his Scottish earldom was bestowed on his grand-uncle (the second son of Archibald the grim), James, surnamed the gross, who in 1437 had been made earl of Avondale. He died in 1443, being succeeded by his son William, who, by marriage with his kinswoman (the only daughter of Archibald, fifth earl of Douglas, and second duke of Touraine), again added the lordship of Galloway to the Douglas possessions. He was, for a time, all-powerful with king James II., who made him lieut.gen. of the realm; but afterwards losing the royal favor, he seems to have entered into a confederacy against the king, by whom he was killed in Stirling castle, in 1452. Leaving no child, he was succeeded by his brother James, who, in 1454, made open war against king James II., as the murderer of his brother and kinsman (the sixth and eighth earls of Douglas). The issue seemed doubtful for a time,

but the Hamiltons and others being gained over to the king's side, Douglas fled to England. The struggle was still maintained by his brothers, Archibald, who by marriage had become earl of Murray, and Hugh, who in 1445 had been made earl of Ormond. They were defeated at Arkinholm in May, 1455, Murray being slain on the field, and Ormond taken prisoner, and afterwards beheaded. Abercorn, Douglas, Strathaven, Thrieve, and other castles of the Douglases, were dismantled; and the earldom of Douglas came to an end by forfeiture, after an existence of 98 years, during which it had been held by no fewer than nine lords. The last earl lived many years in England, where he had a pension from the crown, and was made a knight of the garter. In 1484, he leagued himself with the exiled duke of Albany to invade Scotland. He was defeated and taken prisoner at Lochmaben, and, on being brought to the royal presence, is said to have turned his back upon the king. The compassionate James III. spared his life, on condition of his taking the cowl. "He who may no better be, must be a monk," muttered the old man, as he bowed to his fate. He died in the abbey of Lindores, in April, 1488; and so ended the elder illegitimate line of the Douglases.

Earls of Angus.—Meanwhile a younger illegitimate branch had been rising to great power. William, first earl of Douglas, was the faithless husband of a faithless wife. She was believed to have had a paramour in sir William Douglass of Liddesdale. Her jealous husband, who slew that "flower of chivalry," had himself shared the affections of the wife of his wife's brother, Margaret Stewart, countess of Angus and Mar. The issue of this amour, which in that age was accounted incestuous, was a son George, who, in 1389, had a grant of his mother's earldom of Angus; married, in 1397, the youngest daughter of king Robert III.; was taken prisoner at Homildon in 1402, and died of the plague in England in the following year. He was succeeded by his son William, who, dying in 1437, was succeeded by his son James, who died without issue, when the title reverted to his uncle. George, fourth earl of Angus, took part with the king against the Douglases in 1454; his loyalty was rewarded by a grant of their old inheritance of Douglas-dale; and so, in the phrase of the time, "the Red Douglas"—such was the complexion of Angus—"put down the Black." He died in 1462, being succeeded by his son Archibald, surnamed Bell-the-Cat, and sometimes also called the great earl. After filling the highest offices in the state, and adding largely to the family possessions, he retired to the priory of canons regular at Whithorn, in Galloway, where he died in 1514. Having outlived his eldest son, he was succeeded by his grandson, Archibald, who, in 1514, married the queen-dowager of Scotland, Margaret, sister of Henry VIII. of England, and widow of James IV. of Scotland. The fruit of this marriage was a daughter, Margaret, who, marrying the earl of Lennox, became the mother of Henry, lord Darnley, the husband of queen Mary, and father of king James VI. The earl of Angus had, for a time, supreme power in Scotland, but in 1528, the young king, James V., escaped from his hands, and sentence of forfeiture was passed against Angus and his kinsmen. The king swore that while he lived the Douglases should have no place in his kingdom; and he kept his vow. On his death in 1542, Angus returned to Scotland, and was restored to his honors and possessions. He died at Tantallon in 1556. His nephew, who succeeded him, died two years afterwards, leaving an only son, Archibald, eighth earl of Angus. This "good earl," as he was called, died in 1588, when his title devolved on his kinsman William, the grandson of sir William Douglas of Glenbervie, second son of Archibald Bell-the-Cat. Dying in 1591, he was succeeded by his son William, who next year obtained from the crown a special recognition of his high privileges as earl of Angus, of taking the first place and giving the first vote in parliament, of leading the vanguard in battle, and of bearing the crown in parliament. He seems to have been a man of scholarly tastes, and is said to have written a history of the Douglases. Having turned Roman Catholic, he was forced to leave Scotland, and spent his latter years in exercises of devotion at Paris, where he died in 1611, being succeeded by his son.

Marquises and Duke of Douglas, and Lords Douglas.—William, eleventh earl of Angus, was created marquis of Douglas in 1633, and dying in 1660, was succeeded by his grandson James, who died in 1700, leaving issue one son and one daughter. The son Archibald, third marquis of Douglas, was created duke of Douglas in 1703, and died childless in 1761, when his dukedom became extinct, and his marquisate devolved on the duke of Hamilton, as descended in the male line from William, earl of Selkirk, third son of the first marquis of Douglas. His grace's sister, lady Jane Douglas, born in 1698, and married in 1746 to sir John Stewart of Grandtully, was said to have given birth at Paris to twin sons in 1748. One of them died in 1753; the other, in 1761, was served heir of entail and provision general to the duke of Douglas. An attempt was made to reduce his service, on the ground that he was not the child of lady Jane Douglas; but the house of lords, in 1771, gave final judgment in his favor. He was made a British peer in 1790, by the title of baron Douglas of Douglas castle, which became extinct on the death of his son James, fourth lord Douglas, in 1857, when the Douglas estates devolved on his niece, the countess of Home. The title of earl of Angus was claimed in 1762, as well by the duke of Hamilton as by Archibald Stewart, afterwards lord Douglas; but neither urged his claim to a decision, and the title is still in abeyance. The right attached to it of bearing the crown of Scotland, was debated before the privy council in 1823, when it was ruled that lord

Douglas's claim to that honor, being a claim of heritable right, fell to be decided in a court of law. It has been supposed that the motto of the Douglas arms, *Jamais arrière*, "Never behind," alludes to the peculiar precedence inherent in their earldom of Angus. The bloody heart commemorates Bruce's dying bequest to the good sir James; the three stars which the Douglases bear in common with the Murrays, seems to denote the descent of both from one ancestor.

EARLS OF MORTON.—Sir Andrew of Douglas, who appears in record in 1248, was apparently a younger son of sir Archibald, or Erkenbald, of Douglas, the second chief of the house. He was the father of William of Douglas, who, in 1296, swore fealty to king Edward I. for his lands in West Lothian, and who was probably the father of sir James of Douglas—surnamed of Lothian, to distinguish him from his kinsman of Clydesdale—who, in 1315, had a grant from Bruce of the lands of Kincavil and Calder-clere. He died about 1320, being succeeded by his son, sir William of Douglas of Liddesdale, who acquired the lordship of Dalkeith (by resignation of the Grahames), the barony of Aberdour in Fife, lands in Tweeddale, and great territories in Liddesdale, Eskdale, and Ewesdale which had been forfeited by the Soulises and Lovels. In 1335, he had a grant of the earldom of Athol, but resigned it in 1342. The knight of Liddesdale—as he was called by his contemporaries, who regarded him as "the flower of chivalry"—was assassinated in 1353 by his kinsman, William first earl of Douglas, partly to revenge his wife's dishonor, partly to revenge the death of sir David of Barclay, who had been assassinated at the instance of the knight of Liddesdale, in revenge for the slaughter of his brother John. Dying childless, he was succeeded by his nephew, sir James of Douglas of Dalkeith. This great chief, who died in 1420, saw Froissart sit as a guest at his board; himself possessed books of law, grammar, logic, and romance; and enjoined in his will that all the volumes which he had borrowed from his friends should be returned to them. His alliances were as princely as his life. His first wife was a daughter of "Black Agnes," the heroic countess of Dunbar; his second was a sister of king Robert II.; and he matched his eldest son, sir James of Douglas of Dalkeith, with a daughter of king Robert III. Their grandson married a daughter of king James I., and in 1458, was created earl of Morton. His grandson, the third earl, dying without male issue in 1553, the earldom devolved on his daughter's husband, the regent Morton—James Douglas, great-grandson of Archibald Bell-the-Cat. After his fall, the title went to Archibald eighth earl of Angus; and when he died childless in 1588, it passed to the lineal male descendant of sir Henry of Douglas (the son of sir John of Douglas, the brother of the knight of Liddesdale), sir William Douglas of Lochleven, who thus became seventh earl of Morton. His losses in the great civil war compelled him, in 1642, to sell Dalkeith to the earl of Buccleuch, and his Tweeddale and Eskdale lands to others; but Aberdour and other old domains of the family still remain with his successor, the earl of Morton, who, there is every reason to believe, descends legitimately in the male line from William of Douglas, the great progenitor of the race in the 12th century.

EARLS, MARQUISES, AND DUKES OF QUEENSBERRY; EARLS OF MARCH, AND EARLS OF SOLWAY.—James, second earl of Douglas and Mar—the hero of Otterburn—had an illegitimate son, sir William of Douglas of Drumlanrig, whose descendants were created viscounts of Drumlanrig in 1628, earls of Queensberry in 1633, marquises of Queensberry in 1682, dukes of Queensberry in 1684, earls of March in 1697, and earls of Solway in 1706. On the death of the fourth duke of Queensberry in 1810, that title, with the barony of Drumlanrig and other lands, went to the duke of Buccleuch; the title of marquis of Queensberry, with the baronies of Tinwald, Torthorwald, etc., went to the heir-male of the family, sir Charles Douglas of Kelhead; and the title of earl of March, with the barony of Neidpath, went to the earl of Wemyss. The title of earl of Solway had become extinct in 1778.

EARLS OF SELKIRK, FORFAR, AND DUMBARTON; VISCOUNT BELHAVEN, AND LORDS MORDINGTON.—In 1646, the third son of the first marquis of Douglas was created earl of Selkirk. In 1651, the eldest son of the same marquis was created earl of Ormond, and in 1661, earl of Forfar. In 1675, the fourth son of the same marquis was created earl of Dumbarton. In 1641, the second son of the tenth earl of Angus was created lord Mordington. In 1633, sir Robert Douglas of Spot, a descendant of the Morton family, was created viscount of Belhaven. Of all these titles, that of the earl of Selkirk is the only one not now dormant or extinct.

A *History of the Houses of Douglas and Angus*, by David Hume of Godscroft, was published at Edinburgh in 1644, in 1 vol. fol., and reprinted in 1748 in 2 vols. 8vo. It preserves the traditions of the family, and has some literary merit, but its accuracy is not to be trusted. The earlier history of the Douglases has been critically examined by the late George Chalmers in his *Caledonia*, vol. i. pp. 579–84 (Lond. 1807); by Mr. Riddell in his *Remarks upon Scotch Peerage Law*, pp. 174–78 (Edin. 1833); by Mr. Cosmo Innes, in the *Registrum Episcopatus Moraviensis*, pp. xliv.-xlvii. (Edin. 1837); and the *Liber S. Marie de Calchou*, vol. i. pp. xxvii., xxviii. (Edin. 1846); and by Mr. Joseph Robertson in the *Origines Parochiales Scotiæ*, vol. i. pp. 152–60 (Edin. 1851). The descent of the houses of Angus and Dalkeith was first ascertained by Mr. Riddell in his *Remarks upon Scotch Peerage Law*, pp. 154–64 (Edin., 1833); and in his *Stewartiana*, pp. 82–4, 137–42. The charters and correspondence of the Morton family have

been edited for the Bannatyne club by Mr. Cosmo Innes in the *Registrum Honoris de Morton* (Edin., 1853, 2 vols. 4to).

DOUGLAS, GAWYN or GAVIN, a Scottish poet, was the third son of Archibald, fifth earl of Angus, and was b. in the year 1474 or 1475. He was educated at St. Andrews for the church, and was early appointed to the rectory of Hawch or Prestonkirk. In 1501 he was made dean or provost of the collegiate church of St. Giles. From the marriage of his nephew, the sixth earl of Angus, to the widowed queen of James IV., Douglas expected rapid preferment; but the jealousy of the nobility and the regent Albany was such that D., who had through the influence of the queen obtained the bishopric of Dunkeld directly from the pope, was tried before the Scottish peers, found guilty of conspiring against the privileges of the crown, and condemned to imprisonment. After reconciliation with the regent, he was set at liberty in about a year, and inducted into his bishopric. Owing to his nephew's ill-treatment of the queen, who thereupon joined with the regent against the Douglases, Gavin D. was deprived of his bishopric, on which he went to England to obtain the aid of Henry VIII. He was, however, suddenly cut off at London by the plague in 1522, and was buried in the Savoy church. One of D.'s earliest poetic efforts was a translation of Ovid's *Remedy of Love*, but it has not been preserved. In 1501, he wrote his *Palace of Honor*, addressed to king James IV. The leading idea of the poem, and some of the details, resemble Chaucer's *Temple of Fame*. *King Hart*, the only other long poem of D., presents a metaphorical view of human life. But the most remarkable production of this author was a translation of Virgil's *Æneid* into Scottish verse, which he executed in the years 1512 and 1513, being the first version of a Latin classic published in Britain. It is generally allowed to be a masterly performance, though in too obsolete a language ever to be popular. D.'s verse is far from rhythmical to modern ears; yet the felicitous character of his allegories, and the rich beauty of his descriptions, might well tempt the lovers of genuine poetry to give him a trial. A collected edition of his works in four volumes was issued under the superintendence of John Small, M.A., in 1874.

DOUGLAS, GENERAL SIR HOWARD, Bart., G.C.B., son of admiral sir C. Douglas, was b. at Gosport in 1776. Entering the army when young, he served in Spain and Portugal in 1808 and 1809, and again in Spain in 1811 and 1812. He was governor of New Brunswick from 1823 to 1829, lord high commissioner of the Ionian Islands from 1835 to 1840, and from 1842 to 1847 was M.P. for Liverpool. In 1851, he became a gen. in the army, and col. of the 15th regiment of foot. He has written several treatises, among which are *An Essay on the Principles and Construction of Military Bridges, and the Passage of Rivers in Military Operations* (Lond. 1816); a treatise on *Naval Gunnery* (1819; 4th edit., 1855); *Observation on Carnot's Fortification*, etc. His treatise on *Naval Gunnery* is regarded as a standard authority in foreign countries, although his recommendations were not acted upon by the British admiralty until 13 years after the publication of his work. He censured the conduct of the war in the Crimea in 1855, and declared that Sebastopol could not be reduced unless by a change in the plan of operations, such as he traced. His prophecy was verified by the event. He also published *Considerations on the Value and Importance of the British and North American Provinces*, and a treatise entitled *Naval Evolutions*. He died Nov., 1861.

DOUGLAS, JOHN, D.D., was the son of a respectable shopkeeper of Pittenweem, Fifeshire, and was b. there in 1721. In 1736, he entered St. Mary's college, Oxford, where he took his bachelor's degree after five years' study. D.'s life is little more than a chronicle of his very numerous preferments, which ended in his being translated to the see of Salisbury in 1791. He died on the 18th May, 1807. D. only occasionally resided on his livings. He generally spent the winter months in London, and the summer months at the fashionable watering-places, in the society of the earl of Bath, who was his great patron. He was devoted to literature; but most of his productions were only interesting to his own time. Among other works chiefly of a pamphlet kind, he wrote a *Vindication of Milton from the Charge of Plagiarism, adduced by Lauder* (1750); *A Letter on the Criterion of Miracles* (1754); an ironical pamphlet against the Hutchinsonians and Methodists, entitled *The Destruction of the French Foretold by Ezekiel* (1759); and the *Introduction and Notes to Captain Cook's Third Voyage* (1781).

DOUGLAS, STEPHEN ARNOLD, 1813–61; a statesman; b. Brandon, Vt., d. Chicago. His father, a respectable physician, died when he was two months old, leaving the mother in straitened circumstances. The son lived with her on a farm until he was 15 years old, when he apprenticed himself to a cabinet-maker. Before the end of two years his health failed and he abandoned his occupation. After attending Brandon academy for one year, he removed with his mother to Canandaigua, N. Y., and resumed his studies in the academy there, at the same time beginning to prepare himself for the legal profession. In 1833, he went to Winchester, Ill., walking a part of the way for lack of funds, and opened a school, which he taught for three months, still pursuing his studies for the bar. In 1834, he was admitted to practice and within a year was elected attorney-general for the state. He resigned this office, Dec., 1835, on being elected a member of the legislature. In 1837, he was appointed register of the United States land office at Springfield, but resigned in 1839. In 1837, he was nominated for member of congress by the democratic party, and came very near an election. In 1840,

he was appointed secretary of state of Illinois. In 1841, he was elected a judge of the supreme court of the state by the legislature, but resigned in 1843 to become again a candidate for congress. He was elected this time by over 400 majority, and re-elected for two successive terms. He resigned after his election for the third time, to accept the post of senator of the United States for six years from Mar. 4, 1847. As a member of the house of representatives, he took an active part in the political discussions of the time. In the Oregon controversy he took extreme ground against Great Britain, claiming the whole territory for the United States up to lat. 54° 40′. He was also an earnest advocate for the annexation of Texas, and as chairman of the committee on territories, 1846, reported the joint resolution declaring that country to be one of the states of the American union. He was an ardent supporter of president Polk in the war with Mexico. The bills to organize the territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas, and Nebraska, were all reported by him, as were also those providing for the admission to the union of the states of Iowa, Wisconsin, California, Minnesota, and Oregon. He was a strenuous opponent of the "Wilmot proviso," and of every other measure for resisting the extension of slavery by federal action, holding to the doctrine called "squatter sovereignty"—the doctrine, in other words, that the settlers in a territory had the right to say whether they would have slavery or not. In Aug., 1848, however, he so far relinquished this doctrine as to propose an amendment to the Oregon bill, extending the Missouri compromise line of 36° 30′ to the Pacific, thus prohibiting slavery in the region n. of that line, and recognizing it in that s. thereof. The amendment prevailed in the senate, but was lost in the house of representatives. The land was now filled with excitement upon the slavery question, and the compromise measures of 1850 were devised and passed as a "final settlement" of the controversy. Instead of quieting the agitation, however, they fanned it to an intenser heat. In 1852, D. was an unsuccessful candidate for the democratic nomination for president of the United States. During the congressional session of 1853–54, he reported the bill to organize the territories of Kansas and Nebraska, the freedom of which from slavery was solemnly guaranteed by the Missouri compromise of 1820. This restriction Douglas now proposed to repeal or disregard, leaving those territories under the doctrine of "squatter sovereignty," open to the introduction of slavery. The enactment of this measure created intense excitement in the northern states, and D. was hotly denounced. From this time forward the question of the extension or non-extension of slavery was the paramount issue before the country—the compromise measures of 1850 proving utterly abortive as a means of stopping anti-slavery agitation. In 1856, D. was again a candidate for the presidential nomination of his party, but James Buchanan gained the nomination. In 1858, desiring a re-election to the senate, he engaged in a political canvass of the state of Illinois—Abraham Lincoln, the republican candidate for senator, being his antagonist. They spoke from the same platform in regular debate, upon conditions mutually agreed to, in every quarter of the state. A majority of the popular vote was cast against him, but D. carried the legislature by a small majority, and was consequently re-elected to the senate. He was in favor of the annexation of Cuba to the United States, and a warm champion of the Pacific railroad. In the presidential election of 1860, the democratic party was divided, D. being supported by the northern and Breckinridge by the southern section. The republicans nominated and elected Abraham Lincoln. After the beginning of the war of the rebellion, D. took strong ground in favor of the union, giving his influence to uphold the general government. During his last illness, he dictated for publication a letter in which he declared it to be the duty of all patriotic men to sustain the union, the constitution, the government, and the flag, against all assailants. He was short of stature, but stoutly built, and was familiarly called "the little giant." He was endowed with qualities which gave him great power over masses of men. His first wife (1847) was Martha, daughter of col. Robert Martin of Rockingham co., N. C.; his second, Adele, daughter of James Madison Cutts of Washington. By his first wife he had three children, the eldest of whom, Robert Martin Douglas, was for a time private secretary of president Grant.

DOUGLASS, David Bates, 1790–1849; b. N. J.; graduate of Yale, 1813. He went into the army, and was one of the defenders of fort Erie, for which he was brevetted captain. In 1815, he was assistant professor of natural and experimental philosophy at West Point; in 1819, astronomical surveyor in fixing the boundary with Canada from Niagara to Detroit, and the next year in the same capacity further west. In 1832, he accepted the professorship of civil architecture in the university of New York, and prepared the designs for the building on Washington square. He surveyed the region of Croton river, with a view to a supply of water for the city; his plan was accepted, and he was appointed chief engineer. In 1839, he planned and laid out Greenwood cemetery. From 1841 to 1844, he was president of Kenyon college. In after years he laid out cemeteries at Albany and Quebec. His last official position was professor of mathematics and natural philosophy in Hobart college.

DOUGLASS, Frederick, American orator and journalist, was born at Tuckahoe, near Easton, Maryland, about 1817. His father was a white man, his mother a negro slave, and he was reared as a slave on the plantation of col. Edward Lloyd until 10 years old, when he was transferred to a relative of his owner at Baltimore. There he

worked in a ship-yard, and taught himself to read and write. At the age of 21, he escaped to New York, and thence to New Bedford, in Massachusetts, where he married a woman of color, and worked until 1841, when he attended an anti-slavery convention at Nantucket, and spoke so eloquently on the subject of slavery, that he was employed as an agent of the Massachusetts anti-slavery society, and lectured for four years with great success. In 1845, he published his autobiography, and accepted an invitation to make a lecturing tour in Great Britain, where, in 1846, a contribution of £150 was made to buy his freedom. Returning to America, he established, in 1847, *Frederick Douglass's Paper*, a weekly abolition newspaper, at Rochester, N. Y. In 1855, he re-wrote his autobiography, under the title of *My Bondage and my Freedom*. In 1871, he was secretary to the Santo Domingo commission; and in 1872 was elected a presidential elector for the state of New York. Mr. D. is a tall, dark mulatto; a bold, vigorous, earnest, and fluent speaker, and a ready and able debator.

DOUR, a t. of Belgium, in the province of Hainault, 9 m. w.s.w. of Mons. It is well built and prosperous, and has several schools and a literary society. Coal and iron mines are worked in the vicinity; there are also many quarries, and to some extent, weaving, bleaching, and leather-dressing are carried on. Pop. 8,500.

DOU RO (Span. *Duēro*, Port. *Doūro*), the name of one of the largest rivers of Spain and Portugal, rises in the province of Old Castile, about 30 m. w.n.w. of the town of Soria. From its source its flows s.e. to Soria, then winds towards the w., and pursues a general westward direction till it reaches the Portuguese border; it then flows s.w., forming for about 60 m. the boundary between Spain and Portugal; then crossing Portugal and flowing w., it falls into the Atlantic below Oporto. Its Portuguese tributaries are comparatively small. The total length of the river is about 500 miles. The D. is a noble river, and flows through some of the most imposing rock-scenery in the world, as at Barca d'Alva; but is rapid, and of difficult navigation, on account of rocks, sand-banks, etc. It passes through a large portion of the wine-country of Portugal, and conveys the produce to Oporto for exportation in flat-bottomed boats, containing from 30 to 70 pipes each.

DOUROUCOU'LI, a small monkey of Brazil, sleeping by day but active and fierce at night in pursuit of birds and insects. The body is only about 9 in. long, the tail 14; fur soft and grayish white, with a brown stripe down the back. The dourouculi looks more like a cat than a monkey, and sits up like a dog. It has a harsh disagreeable voice, and is difficult to domesticate.

DOUSA, JANUS, (JAN VAN DER DOES), 1545–1604; a Dutch statesman, historian, poet, and philologist, the defender of Leyden. He studied at Douay, Paris, and in other cities, and became friendly with many eminent scholars. In 1572, he was sent as ambassador to England, and in 1574, was charged with the government and defense of Leyden, then besieged by the Spaniards. When the university of Leyden was founded he was appointed first curator. In 1585, he was sent to England to solicit assistance from queen Elizabeth. In 1591, he was a member of the states-general. His principal work was the *Annals of Holland*.

DOVE (probably from the same root as *dive*, owing to its habit of ducking the head; compare Lat. *columba* with Gr. *kolumban*, to dive), a name sometimes extended, as the name pigeon also is, to the whole family of *columbidæ*, sometimes like it restricted—at least when used without prefix—to the genus *columba* of the more recent ornithological systems. No distinction between the terms dove and pigeon is sanctioned either by constant scientific or general popular use. Audubon attempts to make a distinction, giving the name pigeon to those species of which many nests are built close together on the same trees, and dove to those which are solitary in their nidification; but this distinction is quite unsuitable to the European species, and contrary to British usage. See PIGEON.

DOVE. In Christian art, the dove is employed as an emblem of the Holy Ghost, no doubt from the fact of this being the form in which the Spirit descended on our Lord at his baptism. From the dove being also used to symbolize purity, it is generally represented white, with its beak and claws red, as they occur in nature. In the older pictures, a golden nimbus surrounds its head; the nimbus being frequently divided by a cross, either red or black. In stained glass windows we see the dove with seven rays proceeding from it, terminating in seven stars, significative of the seven gifts of the Holy Spirit. Holding an olive branch, the dove is an emblem of peace. When seen issuing from the lips of dying saints and martyrs, it represents the human soul purified by suffering. A dove with six wings is a type of the church of Christ; and when so employed, it has the breast and belly of silver, and the back of gold, two wings being attached to the head, two to the shoulders, and two to the feet. The pyx or box for containing the host (q.v.) in Catholic churches, is sometimes made in the form of a dove, and suspended over the altar; and the dove is often placed on the covers of fonts. In this position it may still be seen in parish churches in England.

DOVE, HEINRICH W., one of the ablest recent physicists of the continent, was b. in 1803, at Liegnitz, in Silesia, where his father was a merchant. He studied at Breslau and at Berlin, at the latter of which he took the degree of doctor in 1826. He was suc-

cessively "privatdocent" and assistant professor of natural philosophy in Königsberg. Having been transferred to a similar post in Berlin, he subsequently became full professor, and was elected to a seat in the royal academy of sciences. His writings, which are very numerous, are to be found in the memoirs of that academy, and in Poggendorff's Annalen, besides several published separately. The most celebrated of these refer to meteorology, climatology, induced electricity, and circularly polarized light. We may mention among his works *Ueber Mass und Messen* (2d edition, Berlin, 1835), a treatise on the art of measuring, and the origin and comparison of the metrical standards of different nations; *Meteorologische Untersuchugen* (Berlin, 1837), a remarkable treatise *Ueber die nicht periodischen Aenderungen der Temperaturvertheilung auf der Oberfläche der Erde* (4 vols., Berlin, 1840–47); *Untersuchungen in Gebiete der Inductionselectricität* (Berlin, 1843). In conjunction with other distinguished German philosophers, D. commenced, in 1837, the publication of an extensive series of treatises on different branches of natural philosophy. This work, called *Repertorium der Physik*, remains unfinished. In his capacity of director of all the Prussian observatories, he published annually an account of their labors. To him is due, amongst a great variety of optical discoveries, the application of the stereoscope to the detection of forged bank-notes—an ingenious and useful idea. To English readers, D. is best known by his treatise on the *Distribution of Heat on the Surface of the Globe*, which was published in 1853, by the British association. In this work he enters fully into the causes of periodic variations of temperature at different parts of the globe, and lays down in admirable charts the monthly and annual isothermal and isabnormal lines—thus tracing the variations in form and position of the different isothermals throughout the year. *Das Gesetz der Stürme* (4th ed., 1874) has also been translated (The Law of Storms). Other works are *Ueber Electricität* (1848); *Optische Studien* (1859); *Eiszeit, Föhn, u. Sirocco* (1867); *Klimatologie von Norddeutschland* (1871). D. died 6th April, 1879.

DOVE, Richard Wilhelm, b. Berlin, in 1833; 1862, professor in the university of Tübingen; in 1865, at Kiel, and in 1868, at Göttingen. He was a member of the Reichsrath in 1871, and sided with the liberals. In 1860, he established and began to edit the well-known periodical, *Zeitschrift für Kirchenrecht*, a leading European publication on ecclesiastical law. He still writes for this magazine.

DOVECOT. It is enacted by the Scottish statute, 1617, c. 19, that no person shall build a dovecot or pigeon-house, either in town or county, unless he be possessed of lands or teinds of the yearly value of ten chalders of victual, lying within at least 2 m. of it. It is also declared, that no person having such qualification shall build more than one dovecot within the "bounds foresaid." It has been held that the statute imposes no restraint on proprietors possessed of a greater rent, beyond limiting them to one dovecot for each portion of ground that yields ten chalders yearly. The statute does not extend to dovecots already built, and if a dovecot be challenged, it must be proved to have been built subsequently to the date of the statute, otherwise the contrary will be presumed. If an estate be purchased, or otherwise acquired from a person who was legally entitled to build a dovecot, the dovecot may be legally retained, but cannot be rebuilt if it become ruinous. The statute 2 Geo. III. c. 29, for the protection of pigeons, does not extend to Scotland. See Pigeon. Dovecot breakers are guilty of theft, and very severe punishments were assigned to them by the old statutes.

DOVER, the capital of Delaware; in Kent co., on Jones river and the Delaware railroad; 77 m. s. of Philadelphia; pop. '70, 6,394—1839 colored. It is regularly built, with straight, wide, well-shaded streets, crossing at right angles. There are some fine public edifices, notably the city hall, post-office, and court-house; and there is considerable manufacturing industry.

DOVER, a city of New Hampshire, U. S., founded in 1623, is the oldest in the state. It has considerable cotton, woolen, iron, brass, and leather manufactures, and extensive print-works, and is well supplied with churches and educational establishments. Its pop. in 1870 was 9,294.

DOVER (*ante*), the seat of justice of Strafford co., N. H., on the Cocheco, 2 m. above its junction with the Piscataqua, 12 m. from Portsmouth, on the Boston and Maine railroad; pop. '80, 11,693. It is handsomely laid out, and has a great number of fine residences, and some imposing public buildings. Water-power is supplied by the Cocheco, which here has a fall of 32 ft., the dry season being provided for by a great reservoir. The chief business is the manufacturing of cotton, wool, leather, carriages, hats and caps, machinery, etc., in which probably 2,000 persons are engaged. There are excellent schools and a good city library. The place was settled in 1623, and is the oldest town in the state. Like most of the early settlements in New England, Dover suffered from Indian attacks. In 1698, 23 of the people were killed and 29 carried into captivity. The city charter dates from 1855.

DOVER, a t. in Morris co., N. J., on the Rockaway river, the Morris canal, and a branch of the Delaware, Lackawanna, and Western railroad; pop. about 2,000. It is the center of an iron-mining region, and the people are largely engaged in the mining

and manufacturing of that material. There are also other manufactures. The surrounding scenery is beautiful.

DO'VER, a parliamentary and municipal borough in the e. of Kent, 66 m. e.s.e. of London, and the head-quarters of the south-eastern district of the British army, is not only a charmingly situated watering-place, but, being the nearest point of the English coast to France, is a seaport of rapidly growing importance. Within the last few years £750,000 have been expended by the government in constructing a magnificent pier, which, running out a distance of 2,100 ft. seawards, terminates in a fort fitted to bear two guns of heavy caliber, so mounted, that they will completely sweep the channel. This granite isthmus affords a safe anchorage for vessels in the stormiest weather, and travelers for Calais, about 25 m. distant, or Ostend, for which places passenger and cargo steamers leave twice a day, are enabled to embark or land in any state of the tide, or even when a furious gale is raging. Works which will cost over a million sterling are contemplated by the government to carry out a scheme for the erection of Dover bay into a naval rendezvous and coaling-station. The fortifications comprise Dover castle, which occupies a commanding position on the chalk cliffs, 375 ft. above the level of the sea, and in the construction of which Saxons and Normans displayed no small amount of ingenuity; the western heights, fort Burgoyne, the south front, the drop redoubt, the citadel, the western outworks, and the north center bastion. No special trade is attached to the town, which transacts a miscellaneous maritime business with the French and Belgian ports, and offers excellent harbor accommodation for every variety of shipping. Pop. of borough, which returns two members to parliament (1871), 28,506. D. is well sheltered by the cliffs, and ends landward in a charming valley leading to what is known as "The Garden of Kent." In Roman days it was known as Dubris; the Normans called it Dovere; the French, Douvres; whilst in legal documents of this day the town is Dovar, all four terms being variations of the word "Dour," the name of the small river which runs through the town. Fortified and walled by William the Conqueror, during whose reign it was nearly burned down, noted as the place of king John's submission to the pope, besieged by the French, held during the civil war by the parliamentarians, threatened by the first Napoleon, and celebrated as the head-quarters of the lord wardens of the cinque ports, D. holds a distinguished place in English history. Three submarine cables connect it with the continent, and, if the designs of eminent French and English civil engineers are practicable, a tunnel will soon be constructed under the channel, which will bring France within half an hour's journey from Dover.

DOVER, STRAIT OF (*Fretum Gallicum, Pas de Calais*), the sea-channel between England and France, connecting the English channel and North sea, whose tides meet here. It is 18 to 25 m. broad, and 6 to 29 fathoms deep, but at Warne and Ridge Shoals only 1½ to 4 fathoms. The English coast consists of chalk cliffs 300 to 600 ft. high, succeeded on the s. by lower greensand, and the French, from Calais to cape Grisnez, is of similar strata. Britain and the continent seem to have been once united here by an isthmus. In Aug., 1875, capt. Webb, an English naval officer, accomplished the wonderful feat of swimming the S. of D. in 21¾ hours.

DO'VERON, or DE'VERON, a river of the n.e. of Scotland, rising in the w. of Aberdeenshire, a little s. of the Buck of the Cabrach (2,377 ft. high). It runs 55 m. n.e., or 36 in a straight line, through adjacent parts of the counties of Aberdeen and Banff, and partly dividing them, past Huntly to the North sea at Banff. It drains a basin of 410 sq.m., composed of syenitic greenstone, metamorphic rocks, graywacke and old red sandstone.

DOVER'S POWDER is a preparation of powder of ipecacuanha 1 dram, opium in powder 1 dram, and sulphate of potash 1 ounce. The whole is thoroughly mixed, and the ordinary dose is from 5 to 10 grains. Occasionally, saltpeter is added. It is a most valuable medicine, and acts as a sudorific, increasing the proportion of sweat or sensible perspiration. In feverish conditions, where there is the dry furred tongue, and the dry skin, and the brain out of order, D. P. is reckoned to prove injurious; but where the tongue is moist, the skin moist and soft, and the brain comparatively unaffected. D. P. is of great service.

DO'VRE FJELD. See SCANDINAVIA.

DOW, LORENZO, 1777–1834; b. Conn.; an American preacher of limited education, noted for his eccentricities as well as zeal. In youth he was in much perplexity about religion, but finally joined the Methodists, and for a short time was a preacher in that denomination, which he left under a conviction that he was called to be a missionary to the Roman Catholics of Ireland. His preaching in that country attracted crowds of people, and brought him some persecution. He also visited England, introducing there the system of camp-meetings, which is still popular among the Methodists. After returning to the United States for a time, he repeated his visits to Ireland and England in 1805. He afterwards preached for many years in the United States, traveling all over the country, and sometimes making appointments a year in advance, which he filled at the exact day and hour. His natural eloquence and his eccentricities of dress and speech attracted large audiences everywhere. He preached much against the Jesuits, whom he

regarded as conspirators against civil and religious liberty. His *Polemical Works* appeared in 1814. Among his other writings are *The Stranger in Charleston, or the Trial and Confession of Lorenzo Dow; A Short Account of a Long Travel;* and the *History of a Cosmopolite*—the cosmopolite being himself.

DOW, NEAL, a temperance reformer, b. Me., 1803. He is the author of what is known as the "Maine Law," prohibiting the sale of intoxicating drinks in that state under severe penalties, in operation since 1851. He was a brig.gen. of volunteers in the war for the suppression of the rebellion, and was taken prisoner near Port Hudson in 1863. He is still an uncompromising opposer of strong drink even as moderately used.

DOW'AGER (Fr. *douairière*, from *douaire*, dowry, dower, derived from the Greek and Lat. *dos*, a thing given, verb *do*, to give), a widow with a dower (q.v.); but commonly the title is applied only to the widows of persons of high rank. The queen-dowager, as the widow of the king, enjoys most of the privileges which belonged to her as queen-consort. But it is not high treason to conspire her death, because the succession to the crown is not thereby endangered. Still no man can marry a queen-dowager without special license from the king. Though an alien born, the queen-dowager is entitled, by the common law, to dower after the king's death, though it was not till recently that this privilege belonged to the alien widow of a subject. A queen-dowager, though she should marry a subject, does not lose her regal title, as peeresses-dowager, when commoners by birth, lose their peerages when they marry commoners.

DOW, DOU, or **DOUW,** GERARD, one of the most exquisite of all the Dutch *genre*-painters, was b. at Leyden in 1613. He received his first instructions in drawing from one Dolendo, a draughtsman, and at the age of 15 entered the school of Rembrandt. That marvelous genius for color which the latter possessed, fascinated the young painter, who soon showed a similar mastery over *chiar-oscuro*, but at the same time developed artistic qualities of a wholly different kind from those of his master. The most insignificant incidents of daily life were precious to D., and were delineated with a delicacy, neatness, and care, that could not be surpassed. In his workshop, the utmost cleanliness prevailed. D. was true to nature in a degree positively wonderful. The richness, transparency, vigor, and harmony of his coloring are beyond all praise. In consequence, his pictures, though generally small in size, are considered gems of art, and have brought astonishing prices. One of his best works, "The Dropsical Woman," is valued at 30,000 guilders. Among his other pieces may be mentioned "The Village Grocer," "The Dutch Cook," "The Mountebank," "The Fiddler," "The Dentist," and "The Interior of a Household." His works, which are pretty numerous, are in all the great European collections. D. died at Leyden in 1680.

DOWER (Lat. *dos*, in Domesday, *maritagium*), "in the common law, is taken for that portion of lands or tenements which the wife hath for terme of her life of the lands or tenements of her husband after his decease, for the sustenance of herselfe, and the nurture and education of her children."—*Coke upon Litt.* 30 *b*. Formerly, a widow's right to D. was protected by the law, and could only be defeated by certain prescribed means; but by 3 and 4 Will. IV. c. 105, a husband, by simple conveyance of his land, or by burdening it with debt, may defeat the right of his widow to dower. He may effect the same purpose by introducing into the deed of conveyence to himself, or into his last will and testament, a simple declaration of his intention to bar his widow's right of dower. Though the right of D. has thus lost much of its importance, the history of this right forms an interesting chapter in the English common law. In feudal times, when personal property was small, a widow depended almost exclusively on her right to D. for maintenance after her husband's death. Three things, says lord Coke, 31 *a*, were necessary for D.—marriage, seisin, and the death of the husband. The usual amount of D. was a third of the land in which the husband died seised; but, by custom, as gavelkind (q.v.), it amounted sometimes to a half, and in certain cases to the whole. —*Litt.* s. 37. Besides D. at common law, and D. by custom, three other species of D. are noticed by Littleton—viz., *dower de la plus belle*, s. 47; *dower ad ostium ecclesiæ*, s. 39; and *dower ex assensu patris*, s. 40. The first of these was where a man died possessed of lands held partly by knight's service (q.v.), and partly by socage (q.v.), leaving a child under 14. the widow could be compelled, as guardian in socage, to take her D. out of the socage lands. This species of D. fell with the military tenures by 12 Car. II. c. 24. The last two species of D. mentioned above were both made at the time of the celebration of the marriage. *Dower ad ostium ecclesiæ* was when the husband, being of full age, at the church door specially endowed his wife in the whole or a part of his lands. In *dower ex assensu patris*, the bridegroom's father being alive, the same form was observed, with the sanction and consent of the father. In both of these cases the widow was entitled, on death of her husband, to enter at once upon the land without any assignment. These species of D. were abolished by 3 and 4 Will. IV. c. 105. s. 13. In D. at common law, and D. by custom, which are still suffered to exist, a widow cannot enforce her claim until certain lands have been assigned to her for her D. by the heir or by writ of the sheriff.—*Co. Litt.* 34 *b*. In early times, it was necessary to pay a duty to the lord for this assignment, but this exaction was abolished by Magna Charta. In its general principles, the right to D. in England resembled the right of terce (q.v.) in Scotland. In both countries, the amount allowed by law was a third of the husband's lands, and in

both a certain process was necessary before the widow could enforce her right. A woman forfeits her right to D. by eloping from her husband (13 Edw. I. c. 34), by the treason of her husband, by divorce *a vinculo*, but not by divorce *a mensa et thoro*. The right to D. was also barred by levying a fine (q.v.) of lands, by conveyance to uses in bar of D., and by the settlement of a jointure upon the wife. See FINE, JOINTURE.

DOWER (*ante*), the legal term by which is expressed the prescriptive right of a wife in the estate of her deceased husband. The term is derived from the English common law, the provisions of which, in this respect, have undergone many changes since the ancient days. As a general rule, in the United States, the widow's dower includes a right for life to the use of one third of the lands of which her husband died possessed, and of the profits arising therefrom. A wife may waive her right by the acceptance in lieu thereof of a jointure or some other provision made by will, or she may join her husband in a conveyance of the estate in some form prescribed by law. She may be barred by marital infidelity. In some states, in case of divorce for the husband's fault, the wife takes her dower immediately as if he were dead. The laws on this subject in the different states are far from uniform, and they are constantly subject to change. In some states the right of dower is not merely a right of use, but an estate in fee; in others, dower is barred by judicial sale for the enforcement of a debt or contract.

DOWLAS, a kind of coarse strong linen, used by working-people for shirts, and manufactured largely at Knaresborough in Yorkshire, at Dundee, and at Newburgh and other places in Fifeshire. Since the introduction of calico, the home demand for dowlas has very much diminished, the article being little used except in the iron districts. The principal exports of D. are to Spain, and the countries inhabited by peoples of Spanish origin, in North and South America.

DOWLATABAD' (in English, *Abode of Prosperity*), a strongly-fortified t. of Hindustan, within the Nizam's dominions, near their n.w. frontier, in lat. 19° 57 n., and long. 75° 18' east. The town is commanded by a rock-fortress, which, with a height of about 500 ft., is scarped into a perpendicular for the lowest third of the altitude. This stronghold is all the more formidable from its being completely isolated, being fully 3,000 yards distant from any other eminence. The town of D. has recently greatly decayed, and only a small portion of it is now inhabited.

DOWLER, BENNET, a physician, b. Va., 1797; educated at the medical school of the university of Maryland; settled in New Orleans in 1836, where his professional standing is high. He was for some years the editor of the *New Orleans Medical and Surgical Journal*. He is the author of a *Tableau of the Yellow Fever of* 1853, and of various contributions to the periodical literature of the profession. He founded the New Orleans academy of sciences. He has performed many experiments upon the human body immediately after death, the results of which are deemed valuable.

DOWN, a maritime co. in the s.e. of Ulster province, Ireland. It is 51 m. long, and 38 broad, with an area of 967 sq.m., $\frac{8}{10}$ths being arable, and $\frac{1}{10}$ in wood. It has a coast-line of 67 m., or 125 by the inlets, mostly low and rocky, and with many isles off it. The chief inlets are Belfast lough, 3 m. broad, and 15 deep; Strangford lough, $\frac{1}{2}$ to 3 m by 10; Dundrum and Carlingford bays. The Mourne mountains cover 90 sq.m. in the s., and rise 2,796 ft. in Slieve Donard. The other parts of D are mostly undulating and hilly, with plains and fine meadows along the rivers. The chief rocks are lower Silurian—covering most of the county—and granite, composing the Mourne and Croob mountains. The chief rivers are the Upper Bann and the Lagan. The Newry canal admits vessels of 50 tons, and with the Ulster canal opens communication through almost all Ulster. Thick marl beds occur in the alluvial tracts. The soils are chiefly stony and clayey loams. In 1876, 316,336 acres, out of the total 612,495, were in crop. The chief crops are oats, potatoes, turnips, wheat, flax, and barley. Many pigs are reared. The chief manufacture is linen, especially the finer fabrics, as muslin, woven in the houses of the small farmers. Flax and cotton mills have become common. Hosiery, leather, salt, thread, and woolens are also made. These, with corn, butter, pork, and hides, are the chief exports. D. is among the best cultivated of the Irish counties, and has more resident gentry (almost all Protestants, of English and Scotch descent) than any other Ulster county. It contains 10 baronies, 5 poor-law unions, and 70 parishes. The chief towns are Downpatrick, Newry Newtownards, Bannbridge, and Donaghadee. D. sends four members to parliament, two for the county, one for Downpatrick, and one for Newry. Pop. '71, 277,294, of whom 116,017 are Presbyterians, 88,003 Roman Catholics, 60,868 Episcopalians, and the rest of other denominations. Presbyterianism prevails in the towns and low country, and Roman Catholicism among the mountains, and in the barony of Lecale. D. has many ancient remains, as raths, round towers, castles, and abbeys. On the top of Slieve Croob (1755 ft. high) are 23 stone cairns, one being 54 ft. high.

DOWN'CAST, the name of a shaft used for ventilating mines. The foul air is made to ascend through a flue by a fire burning at the bottom, while fresh air descends through the downcast.

DOWNES, JOHN, 1784–1855, b. Mass.; an American naval officer. He entered the navy in 1802, and was in the frigate *New York* as midshipman during the war with

Tripoli, distinguishing himself by gallant service. He was made a lieutenant in 1807, and served as such on board the frigate *Essex* against the British, under capt. Porter, 1812-14, who assigned him to the command of the cruiser *Essex Junior*. In 1815, he commanded the brig *Epervier*, under Decatur, in the war against Algiers, and assisted in taking an Algerine pirate; also in capturing the Algerine brig *Estido*. In 1817, he was made captain, and commanded the frigate *Macedonian* in the Pacific, 1819-21. In 1828-29, he served in the Mediterranean squadron, and 1832-34 he was with the squadron in the Pacific. In 1837, he was appointed commander of the navy-yard in Charlestown, serving till 1842. He filled the same post again, 1850-52.

DOWNHAM MARKET, a t. in the w. of Norfolk co., on a hillside, on the right bank of the Ouse, 40 m. w. of Norwich, and 10½ s. of Lynn-Regis. It lies amid fen and dairy land. Pop. '71, 2,752. It has a bell-foundry, and a celebrated butter-market. By the Ouse and Cam, vessels proceed from Lynn on the coast to Cambridge, 30 m. above Downham Market. A market was confirmed here in the time of Edward the confessor.

DOWNING, ANDREW JACKSON, 1815-52; b. N. Y.; a pomologist and landscape gardener. In his chosen department he showed a fine taste, and introduced great and lasting improvements, developing a public appreciation of harmonious landscape decoration. He was drowned in the Hudson river when the steamer *Henry Clay* was burned. His works are *A Treatise on the Theory and Practice of Landscape Gardening*, and *Fruit and Fruit Trees of America*, both highly esteemed. He was for a time editor of the *Horticulturist*, published in Albany. A volume of his *Rural Essays*, with a memoir by George Wm. Curtis, was published after his death.

DOWNING COLLEGE, CAMBRIDGE, founded solely by sir George Downing, of Gamlingay park, Cambridge, who, by a will of date 20th Dec., 1717, devised his estates in the counties of Cambridge, Bedford, and Suffolk to various relations in succession, and on failure thereof, to build and found a college on a plan to be approved of by the two archbishops of England and the masters of St. John's and Clare colleges. Owing to various litigations and other difficulties, it was not till 22d Sept., 1800, that the college received its charter, sealed with the great seal, nor till May, 1821, that the buildings were sufficiently advanced to admit of undergraduates residing and keeping terms. The college will consist of a master, two professors (one of law and one of medicine), at least eight fellows, and at least ten scholars; but at first only the master, professors, and three fellows were appointed. In 1878, seven of the eight fellowships had been filled up. Of the eight fellows two must be resident, and of these one must be in holy orders; the resident fellows hold their fellowships for life, but the tenure is affected by marriage; the six non-resident fellows, who are presumed to be persons actively engaged in the studies of law and medicine, hold their fellowships for 12 years. This college has over 60 members of senate, about 70 undergraduates, and above 130 members on the boards.

DOWNPATRICK (mount of Patrick), or DOWN, a parliamentary, municipal, and cathedral town, in the s. of Down, of which it is the capital. It is situated near the mouth of the Quoyle, which flows into the s.w. end of lough Strangford, 74 m. n.n.e. of Dublin, and 21 m. s.s.e. of Belfast, with which town it is connected by railway. The cathedral was restored in 1790 on the site of one built in 1412, and burned in 1538 by lord deputy Grey. A handsome Catholic church was erected here in 1872. Vessels of 100 tons reach the quay a mile from Downpatrick. It has manufactures of linen, soap, leather, and malt liquors. Pop. '71, 3,621, of whom 1630 are Roman Catholics, 1124 Episcopalians, 749 Presbyterians, the rest of other denominations. It sends one member to parliament. To the n.w. of D. are the remains of great earth-works, ¾ m. in circuit, inclosing a conical rath 60 ft. high and 2,100 in circumference. D. was famous before the arrival of St. Patrick, who founded religious establishments here. D. was burned by Edward Bruce in 1315, and plundered by O'Neil in 1552. The holy wells of St. Patrick at Struel, 1½ m. e. of D., were formerly resorted to by Roman Catholic pilgrims from all Ireland, but for the last forty years the pilgrimage has ceased.

DOWNS, THE, an important roadstead or shelter for shipping, off the s.e. coast of Kent, opposite Ramsgate and Deal, between North and South Foreland, and protected externally by the Goodwin sands—a natural breakwater with one to four fathoms water, and often partly dry at low tide. This large natural harbor of refuge is eight miles by six, with an anchorage of four to twelve fathoms, but having many sands and overfalls partly or wholly dry at low water. It is resorted to temporarily by outward and homeward bound vessels, and squadrons of ships of war, and is unsafe only in south winds.—It is defended by Deal, Dover, and Sandown castles.

DOWNS (Ger. *dünen*, Fr. *dunes*, from the root *dun* (q.v.), common to the Gothic and Celtic languages, signifying a *hill*), a term usually applied to hillocks of sand thrown up by the sea or the wind along the sea-coast. It is also a general name for any undulating tract of upland too light for cultivation, and covered with short grass. It is specially applied to two broad ridges of undulating hills s. of the Thames, beginning in the middle of Hampshire, and running eastward, the one (the north D.) through the middle of Surrey and Kent to Dover (about 120 m.), and the other (the south D.) through the s.e. of Hampshire and near the Sussex coast to Beachy head (about 80 miles). Between the two ranges lies the valley of the Weald, from which the chalk strata are supposed to

have been removed by denudation. Towards the Weald, the descent from both D. is rapid, and presents cliffs as of a sea-margin; while the opposite slopes are gradual. The highest point of the north D. is Botley hill, 880 ft.; and of the south D., Ditchelling beacon, 858 feet. These uplands are covered with fine short pasture, which, from its aromatic quality, forms excellent feeding-ground for the famous South Down sheep. The valleys occurring among the hills are usually fertile, and admit of cultivation, so that an excellent field is furnished for mixed husbandry. By pasturing the sheep on the D. during the day, and folding them on the arable fields at night, the latter are highly fertilized.

DOWNTON, a t. in the s.e. of Wiltshire, on the right bank of the Avon, here split into three branches, 6 m. s.e. of Salisbury. It chiefly consists of one long street with the houses irregularly placed. Pop. '71, 3,654. It has a paper-work, and an ancient cross. D., in the middle ages, had a castle, of which the mound or moat remains, and is a singular earthwork, on which Saxon justice was dispensed. Two miles n. of D. is the mansion and estate of Standlinch, the national gift to the heirs of lord Nelson, for which parliament voted £100,000.

DOXOLOGY, a Greek word, signifies an exclamation or prayer in honor of the majesty of God, such as Paul uses at the close of his epistles, and sometimes even in the middle of an argument (Romans ix. 5). The hymn of the angels (Luke ii. 14) is also called a D. by the Christian church; so likewise is the close of the "Lord's Prayer." The so-called "Great Doxology" is simply an expansion of the angelic hymn, and is sung in the Roman Catholic church at the celebration of the Lord's Supper, and at matins. It commences with the words, *Gloria in excelsis Deo* ("Glory to God in the highest"). The ordinary D., "Glory be to the Father, Son, and Holy Ghost, as it was," etc., is repeated at the end of each psalm in the service of the church of England; there is a similar D. in verse to suit different meters.

DOYLE, RICHARD, son of the celebrated caricaturist H. B., whose name was John Doyle, was b. in London in 1826. He became a contributor to *Punch*, and furnished its pages with the well-known sketches of "Ye Manners and Customs of ye English." In 1850, his connection with that publication ceased, and since that period he has employed himself in the illustration of books. Among his works of this nature may be mentioned the *Adventures of Brown, Jones, and Robinson*, and the illustrations to the *Newcomes* and the *Scouring of the White Horse*. He contributed "Sketches of Modern Society" to the *Cornhill Magazine*, and published a Christmas book for 1869, called *In Fairy Land*. His caricatures are all distinguished by the most genial humor, and the most graceful drawing.

DOZY, REINHART, one of the most learned orientalists of the present day, was b. 21st Feb., 1820, at Leyden. He belongs to a family of French origin, which settled in Holland after the revocation of the edict of Nantes. He studied at the university of his native town, and devoted himself especially to oriental studies. In 1850, he was appointed extraordinary, and, in 1857, ordinary professor of history at Leyden. Besides his writings in the *Journal Asiatique* and other periodicals, D. has published *Dictionnaire détaillé des Noms des Vêtements chez les Arabes* (Amst. 1845); *Historia Abbadidarum* (Leyden, 1846–52); and editions of Abdo'l Wáhid al Marrékoshi's *History of the Almohades* (1847); of Ibn-Badrun's *Historical Commentary on the Poem of Ibn-Abdun* (1848), with introduction, notes, glossary, and index, and of Ibn-Adhari's *History of Africa and Spain* (1848–52). In 1849, appeared his masterly performance, *Recherches sur l'Histoire politique et littéraire de l'Espagne pendant le Moyen Age*. A second edition, enlarged and completely recast, was published in 1860. In this work, D. has exposed the gross and willful corruptions of the monkish chroniclers, who persisted in falsifying history for the benefit of Christianity, and who could form no more rational idea of the Moors than that they were "devils," or abetted by the devil, and sent to torment the Spaniards because of their *sins*. Other valuable productions of D. are his *Al-Makkari, Analectes sur l'Histoire et la littérature des Arabes d'Espagne* (Leyd. 1855–61); *Histoire des Musulmans d'Espagne jusqu'à la Conquête de l'Andalousie par les Almoravides* (Leyd. 1861); *Het Islamisme* (Harl. 1863); and *Die Israeliten zu Mekka* (1864).

DRACÆ'NA DRACO, or DRAGON TREE, of the order *liliaceæ*, producing the resin called dragon's blood. Its thickness is greatly out of proportion to its height. The head is crowned with short branches bearing tufts of sword-shaped leaves. Humboldt saw a tree in Teneriffe which for 400 years had measured 45 ft. in circumference. The Guanches worshiped it, and had hollowed its trunk into a small sanctuary.

DRACHENFELS ("Dragon's Rock"), a mountain on the Rhine, one of the range called the *Siebengebirge*, is renowned through Byron's verses commencing

> The castled crag of Drachenfels
> Frowns o'er the wide and winding Rhine

It is situated on the right bank of the river, about 8 m. s.e. of Bonn, and has an elevation of 1056 feet. It is of volcanic origin, consisting of lava, trachyte, and basalt. D. rises abruptly from the river, and is covered with brushwood almost to the top, whence the prospect is magnificent, extending down the river as far as Cologne, and having a charming foreground in Bonn, with its university, and numerous villages and time-worn

castles. The cave where the dragon—from which the mountain takes its name—was wont to abide, is pointed out to the traveler. The ruins of an old castle crown the summit, and add picturesqueness to the Drachenfels.

DRACHMA, DRACHM, DRAM. The D. was a silver coin, the unit of the money-system in ancient Greece. It varied in value in different parts of Greece and at different times. The Attic D. is estimated as equivalent to 9¾*d.* of our money—very nearly a French franc. The Æginetan D. was considerably more. But whatever its absolute worth, it always remained the 6,000th part of the *talent* (about £244), and the 100th part of the *mina* (about £4), and was divided into six obols. There were also coins of two, three, and four drachmas. The D. (originally *a handful*) was also the name of a weight, and 100 drachmas made a mina, in weight, as in money. The weight of the D. is stated at from ¼ oz. avoirdupois to little more than half as much. At this lowest estimate, the mina = 1 lb. nearly. The unit in the monetary system of modern Greece, since 1833, has also been called *drachma;* it is equivalent to $\frac{88}{100}$ of a franc, or about 8½*d.* sterling, and is divided into 100 lepta. In the British system of weights there were, till recently, two drachms or drams: the avoirdupois *dram*—equal to $27\frac{11}{32}$ troy grains—and the apothecaries' *dram* (not now used), equal to 60 troy grains, or ⅛ of an ounce troy. It is this last which is the representative of the ancient drachma.

DRACO, a constellation in the northern hemisphere. The star γ Draconis is celebrated as the one used in determining the co-efficient of aberration of the fixed stars. It is a bright star, nearly in the solstitial colure, and consequently the minor axis of the small ellipse which its apparent place describes in the heavens, lies in the meridian at its transit. Moreover, at the two equinoxes, when its apparent place is at the extremities respectively of this minor axis, it can be observed on the meridian at one equinox about sunrise, and at the other about sunset, so that both observations may be made without the interference of a too bright daylight. These two observations, therefore, are easily taken, and the difference in the north polar distance which they give, is the minor axis of the ellipse described by the apparent place of the star.

DRACO (Gr. *Drakon*), an Athenian lawgiver and archon, who, in the year 624 B.C., was appointed to draw up new laws for the disordered state. These, however, effected little change in the form of the state; but by being committed to writing, put an end to the arbitrary administration of justice on the part of the archons, and resulted in the establishment of a court of appeal—that of the Ephetæ. D.'s legislation had a beneficial and permanent effect upon the political development of Athens. The extraordinary severity of these laws, however, which punished the slightest theft, or even laziness, with death, no less than sacrilege, murder, and treason, caused them to be often neglected, and made them so hated, that Solon was appointed to draw out a new code. Solon, though he softened their severity in most instances, retained that law which punished a murderer with death. D., at a later period, went to Ægina, where, after having introduced his laws, he is said to have been stifled in the theater by the garments thrown upon him as a mark of respect by the people. The severity of his laws gave rise to a pun by Herodicus, who declared that D.'s laws were those of a dragon (Gr. *drakon*) and not of a man. Hence also originated the metaphorical remark of Demades, "that they were written not in ink but in blood." Extremely severe and sanguinary laws are still called *Draconic.*

DRACONTIUM, a genus of plants of the natural order *araceæ*, of which one species, *D. polyphyllum*, a native of Guiana, Surinam, and also of India and Japan, has a powerful action on the nervous system, and is useful in asthma; although at present its chief reputation is the somewhat doubtful one of curing the bite of a snake, to which its mottled stem gives it some resemblance. The flower, when it first expands, emits an intolerable stench.

DRACUT, a t. in Middlesex co., Mass., on the Merrimack, opposite Lowell, with which it is connected with bridges. The town borders on New Hampshire. Agriculture is the main business, but there are also some manufactures of woolens, paper, etc.

DRAFT, an order addressed to a debtor by his creditor, calling upon him to pay a certain sum either to the drawer or to a third party. See BILL, CHECK.

DRAFT, or DRAUGHT, a tentative copy of a legal document, or other formal writing, made for the purpose of adjusting the matter afterwards to be admitted into the fair copy, or engrossed, as it is called. Manuscripts and proof-sheets are the drafts of printed works.

DRAG, a mechanism for slackening the speed of carriages, by operating on one or more of the wheels. The form of D. best known to old travelers by coach is that of the "shoe," a hollow piece of iron attached by a chain to the carriage, which being put below one of the hind wheels, partially reduced the vehicle to the quality of a sledge: by which dragging process the carriage was suitably retarded on going down-hill. As the shoe-drag required to be applied and removed with some inconvenient detention of the vehicle, a step was made in advance when a method of retarding a wheel without detention was discovered. This new process, which is known as the patent drag, consists of a connected piece of mechanism, altogether operated upon by the driver without moving from his seat. A handle affects a series of rods and levers by which a species

of shoe is pressed against one of the wheels, so as to slacken its motion. Such is the kind of drag now very generally attached to gentlemen's traveling-carriages, omnibuses, and other vehicles for passengers on the roads of Great Britain. It is of French origin. Applied in either form, the use of the drag, independently of its safety, is to allow horses to continue running at ordinary speed down-hill without being unduly pressed on by the carriage behind them. A similar contrivance, but of a more powerful kind, called a *break* or *brake*, is applied to arrest the motion of railway-trains, See RAILWAYS.

DRAGOMAN, from the Turkish *trukéman*, the general name given in Turkey to an interpreter, or to a guide to foreigners. The common dragoman corresponds exactly to the Italian *cicerone*, or the French *commissionaire* or *valet de place*. There are several connected with the hotels at Constantinople and other Turkish cities, who pounce eagerly upon European travelers, to perform every imaginable service. The diplomatic dragomen are, however, important personages, being the medium of communication between the Christian ambassadors and the sublime porte. Though usually natives, they and their families enjoy the privilege of being under the protection of the embassy they serve, and are subject to the laws of the country of that embassy, and not to the Turkish law. This privilege, which is also enjoyed by all the subjects of the great Christian powers resident in Constantinople, etc., is much valued, on account of the greater severity of the Turkish laws, and the summary manner in which they are executed. These dragomen are mostly of Italian extraction, either descendants of the old Genoese and Venetian merchants, or Maltese. Strange stories are told of their tricks in garbling the communications they have to make, when private interests can be served by such means, and bribes obtained; and there is no doubt that newly appointed consuls, quite ignorant of the Turkish language, are in some respects almost completely in their power, and that this power is frequently used very unscrupulously.

DRAGON, a name applied in modern natural history, both popularly and by scientific authors, to different kinds of saurian reptiles. Some of these (the genus *draco* of Linnæus) are remarkably characterized by false ribs extending from the sides, so as to support a membrane which is used as a parachute. These are called flying dragons (q.v.), or flying lizards. Another reptile which has received the name D., and is also called D. LIZARD *ada*), belongs to a family of saurians, *teyidæ*, found only in America, closely allied to the *varanidæ* of the old world, and to which, in common with them, the names MONITOR and SAFEGUARD have sometimes been given, in consequence of their being supposed—although erroneously—to give warning by a hiss of the proximity of a crocodile or alligator. It inhabits the marshy plains of Guiana, climbs trees with facility, bites severely, has a long compressed tail, the back and tail crested, the tongue forked like that of a serpent, and attains a length of about 6 feet. Both its flesh and eggs are used as articles of food.

DRAGON. In the mythical history and legendary poetry of almost every nation, the D. appears as the emblem of the destructive and anarchic principle, as it manifests itself in the earlier stages of society—viz., as misdirected physical power and untamable animal passion. Like the erpent, the D. is always a minister of evil, of the principle which aims at negation, opposition, and contradiction, the object of which is to fight against order, harmony, and progress. But whilst the serpent seeks the attainment of its object by cunning and deceitful artifices—crawling on its belly, and always assuming ostensibly characteristics the very opposite of its own—the D. proceeds openly to work, running on its feet, with expanded wings, and head and tail erect, violently and ruthlessly outraging decency and propriety, spouting fire and fury from both mouth and tail, and wasting and devastating the whole land. The destruction of this disorderly element was one of the first objects of human energy, but it was an object which was unattainable by merely human means, and mankind were accordingly indebted for its accomplishment to that intermediate class of beings known as heroes in classical antiquity. As the highest ideal of human strength and courage, the task properly fell to Hercules; but it was not confined to him, for we find both Apollo and Perseus represented as dragon-slayers. From legendary poetry, the D. passed into art, some of the earliest efforts of which probably consisted in depicting it on the shield, or carving it for the crest of a conqueror's helmet. The D. does not seem to have been a native emblem with the Romans, and when they ultimately adopted it as a sort of subordinate symbol, the eagle still holding the first place, it seems to have been in consequence of their intercourse with nations either of Pelasgic or Teutonic race. Amongst all the new races which overran Europe at the termination of the classical period, the D. seems to have occupied nearly the same place that it held in the earlier stages of Greek life. In the *Nibelungen Lied*, we find Siegfried killing a D. at Worms; and the contest of Beowulf (q.v.), first with the monster Grendel, and then with the D., forms the principal incident in the curious epic which bears the name of the former. Even Thor himself was a slayer of dragons (J. Grimm, *Deutsche Mythologie*, ii. 653). Among the Teutonic tribes which settled in England, it was from the first depicted on their shields and banners; and Dr. Plott, in his History of Oxfordshire, ascribes the origin of the very ancient custom of carrying the D in procession at Burford, in great jollity, on midsummer eve, to the fact of a banner adorned with a golden D. having been taken by a king of the West Saxons from a king of Mercia. The custom, however, is said by Brand, on

the authority of Aubanus, to have prevailed in Germany, and was probably common in other parts of England (Brand's *Pop. Antiq.*, i. 321). Nor was the D. peculiar to the Teutonic races. Amongst the Celts, it was the emblem of sovereignty, and as such borne as the sovereign's crest. Mr. Tennyson's *Idylls* have made every one familiar with "the dragon of the great pendragonship," blazing on Arthur's helmet, as he rode forth to his last battle, and "making all the night a stream of fire."

The fiery D., or drake, and the flying D. in the air, were meteoric phenomena, of which we have frequent accounts in old books, and, indeed, as Brand remarks, "the dragon is one of those shapes which fear has created to itself," and which appears in circumstances, and clothes itself in forms, as various as our fears.

In Christian art, the D. is the emblem of sin, the usual form that is given to it being that of a winged crocodile. It is often represented as crushed under the feet of saints and martyrs, and other holy personages. Sometimes its prostrate attitude signifies the triumph of Christianity over paganism, as in pictures of St. George and St. Sylvester; or over heresy and schism, as when it was adopted as the emblem of the knights of the order of the D. in Hungary, which was instituted for the purpose of contending against the adherents of John Huss and Jerome of Prague.

The D. is often employed in heraldry; and other animals, such as the lion, are sometimes represented with the hinder parts resembling dragons. An animal so represented is said to be *dragonné*. See GRIFFIN. A D. without wings is called a lindworm, or lintworm, which Grimm (*Deutsche Mythol.*, ii. 652) explains to mean a beautiful or shining worm.

DRAGON, GREEN, *Dracunculus vulgaris*, a plant of the natural order *araceæ*, which receives its name from its spotted stem. It is a native of the s. of Europe. Its flowers are black, remarkably fetid, and give out exhalations which cause headache, giddiness, and vomiting. The root is emetic, and, probably for no better reason than the peculiar appearance of the stem, has been supposed useful for curing serpent-bites.

DRAGONET, *Callionymus*, a genus of fishes of the goby (q.v.) family (*gobiadæ*), remarkable for having the gill-openings reduced to a small hole on each side of the nape, and the ventral fins placed under the throat, separate, and larger than the pectorals. They have no air-bladder. The species are pretty numerous; most of them finely colored, as the GEMMEOUS D. (*C. lyra*) of the British coasts—called *gowdie* (*gowd*, gold) in Scotland=a fish about 10 or 12 in. long, the prevailing yellow color of which is varied with spots of sapphirine blue, etc.

DRAGON-FLY, *Libellula*, a Linnæan genus of neuropterous insects, now constituting the family *libellulidæ*. They are in general very beautiful, rivaling butterflies in their hues, and like them loving the sunshine. They are, however, easily distinguished from butterflies, even at a distance, by their more slender form and comparatively narrow gauze-like wings; and differ from them still more widely in their habits, as they do not feed on the nectar of flowers, but prey on other insects, which they pursue with rapid flight. Dragon-flies have a large head; the mouth is formed for mastication, and its parts, especially the mandibles, possess great strength.—See the article COLEOPTERA for an explanation of the structure of the mouth in *masticating* insects, and the names of its parts.—The antennæ are short, awl-shaped, and of few joints. The eyes are large, lateral, and projecting. The wings—four in number—are equal in size, or nearly so, long, very thin, and very much reticulated. The legs are short. The abdomen in some is compressed, in others slender and cylindrical, in some remarkable for its extreme slenderness. The French name *demoiselle*, given to these insects, seems to be due to their beauty. They are, however, equally remarkable for their voracity. The great dragon-fly (*aeshna grandis*), an insect about 4 in. long, the largest of the British species, has been seen to dart upon a large cabbage-butterfly which passed as it was flitting up and down in search of prey; and then settling on a twig, it bit off the wings, and in less than a minute devoured the body.

Dragon-flies are usually most abundant in the vicinity of lakes, rivers, and marshes. They deposit their eggs in water, and the larvæ and pupæ are entirely aquatic, living chiefly at the bottom of the water, and creeping on the submerged parts of aquatic plants. They are as ravenous as the perfect insect, which in general form they pretty much resemble; aquatic insects are their food. The pupæ, unlike those of the greater number of insects, are active. They are provided with the means of drawing water into their bodies to supply air for respiration, and expel it again by the same orifice at the extremity of the abdomen, with such force, that they thus propel themselves through the water, whilst their legs are at rest. When the final transformation is about to take place, the dragon-fly pupa crawls out of the water on a stick, rush, or other object; fixes itself by hooks, with which its legs are furnished; and the skin then splitting at the back, the perfect insect comes forth, but with body and wings quite soft and moist, and the wings still folded up into small compass. In the sub-family of *agrionidæ*, the wings are elevated vertically in repose: in the true *libellulidæ* (*libellula aeshna*, etc.), they are extended horizontally.

Dragon-flies extend even into very northern regions, but are most abundant in warm climates.

DRAGONNADES, the name applied to a series of religious persecutions which took place in France in the reign of Louis XIV. and that of his successor, and which were intended to compel the Protestants of that country to renounce their religion. They consisted of armed expeditions, led by a bishop, an intendant, a sub-delegate, or a priest, who marched through the provinces, demanding of the heretics that they should abjure their faith, and leaving such as were refractory to be dealt with by the unscrupulous troops. Foremost among the armed force rode dragoons, who, from the fact of their taking the precedence, and also from the merciless treatment to which they subjected the Protestants, had the unenviable honor of giving a name to the persecutions. Louis XIV., who had been entirely misinformed as to the means employed in the D. by the courtiers and fanatics who surrounded his throne, was delighted to find that from 250 to 400 Protestants were daily being received into the bosom of the church, and in consequence, on the 22d Oct., 1685, a few months after the date of the first of the D., he revoked the edict of Nantes (q.v.), that the good work might be fully accomplished.

DRAGON ROOT, *Arisæma atrorubens,* formerly *arum triphyllum,* a plant of the natural order *araceæ,* a native of North America, the tuber of which is a powerful local irritant, and is used as a stimulant of the secretions in chronic bronchitis, asthma, rheumatism, etc. The powder, made into a paste with honey, is beneficially applied to the mouths and throats of children in aphthæ; and milk, in which the root has been boiled, is a useful ointment in cases of scalled head, ringworm, etc.

DRAGON'S BLOOD, sometimes called gum dragon, an astringent, resinous substance, obtained from several trees of different natural orders, natives of warm countries. The greater part of the D. B. of commerce is probably the produce of *pterocarpus draco,* a large South American tree of the natural order *leguminosæ,* suborder *papilionaceæ,* which at some seasons appears as a magnificent mass of yellow blossom. A similar substance is yielded in the East Indies, by the red sandal-wood tree (*pterocarpus santalinus*); and *dalbergia monetaria,* a tree of the same order, yields it in Guiana. Mexican D. B., used in Mexico as a vulnerary and astringent, is obtained from *croton draco* (see CROTON), of the natural order *euphorbiaceæ.* The best kind of all is supposed to be produced by *calamus draco,* an East Indian palm, and part of it is said to be obtained from the fruit of the palm.—D. B. exudes from the surface of the leaves, and from cracks in the stem of the DRAGON TREE (*dracæna draco*), a tree of the natural order *liliaceæ,* remarkable for the size which it sometimes attains, rivaling even the baobab, and of which a celebrated specimen near Orotava, in the island of Teneriffe, was found by Humboldt in 1799 to have a stem about 45 ft. in circumference, and is described as having been of similar gigantic size in the beginning of the 15th century. The stem of the dragon tree is, however, generally short in proportion to its thickness, and its head consists of numerous short branches, terminating in tufts of sword-shaped leaves. It is not supposed to yield any of the D. B. of commerce.

D. B. is opaque, of a deep reddish-brown color, brittle, smooth, with a shining shell-like fracture, and when burned, emits an odor resembling that of benzoin. It is nearly insoluble in water, but is soluble in alcohol, and the solution will permanently stain heated marble, for which it is often used, as well as for staining leather and wood. It is also soluble in oils and turpentines, and enters into the composition of brilliant and much-esteemed varnishes. It was formerly employed in medicine, but is now almost out of use.—An astringent resin obtained from the *eucalyptus resinifera* of Australia is there called dragon's blood.

DRAGON'S MOUTH, or, in Spanish, BOCA DEL DRAGO, is the name of two straits or passages in the new world. One of them is in South America, separating Trinidad from the mainland, and connecting the gulf of Paria with the s.e. extremity of the Caribbean sea. The other is in Central America, being on the n.e. coast of Veragua, the most north-westerly portion of New Granada, and it communicates between the Caribbean sea and lake Chiriqui.

DRAGOON. From the old fable that the dragon spouts fire, the head of the monster was worked upon the muzzles of a peculiar kind of short muskets which were first carried by the horsemen raised by marshal Brissac in the year 1600. This circumstance led to their being called dragoons; and from the general adoption of the same weapon, though without the emblem in question, the term gradually extended itself till it became almost synonymous with horse-soldier. Dragoons were at one time a kind of mounted infantry, drilled to perform the services both of horse and foot. At present, *dragoon* is simply one among many designations for cavalry, not very precise in its application. In the British army, the *heavy* dragoons and the *light* dragoons are carefully distinguished in regard to the weight of the men, horses, and appointments. The first dragoons in the army were the Scots greys, established in 1683.

In the British army there are at present 7 regiments of "D. guards," and 21 regiments of "dragoons," besides the 3 cuirassed regiments of household troops. See HORSE GUARDS.

DRAGUIGNAN, a t. of France, in the department of Var, on a tributary of the Argens, about 40 m. n.e. of Toulon. It is charmingly situated, in the midst of a valley surrounded by hills, the slopes of which are covered with vineyards and olive plantations.

It is tolerably built; and its streets are adorned with numerous fountains and trees. Its principal structures are the prison, the court-house, a hospital, and a stately clock-tower. It has manufactures of coarse woolens, leather, hosiery, silks, soap, brandy, oil, and earthenware. Pop. '76, 8,029. D. is an ancient place. During the middle ages it was strongly fortified. The fortifications were destroyed in the civil wars, but were reconstructed in 1615.

DRAINAGE, in husbandry, is the art of carrying off water from the soil and subsoil of land by means of open or closed drains or trenches—the term, however, is generally understood to apply to closed drains. By its means, the fertility of wet land has been greatly increased. When the drains are put in every 6 or 10 yards, it is called *furrow* or *frequent* draining.

The vast amount of capital which has been expended in D. within a quarter of a century, attests its utility and necessity. Before the introduction of furrow draining, stiff and tenacious clays were of comparatively little value. They were cultivated at much expenditure of labor, and the crops which grew upon them were influenced to a great extent by the variations of the seasons. A system by which wet and worthless land could be rendered dry and valuable, was an improvement so patent to practical men, that we need not wonder at its general adoption.

D. by open ditches was no doubt the first mode of freeing land from superfluous water. The Roman agricultural writers mention the good results arising from covered drains, which were formed of wood and other substances, which served so far to render the land dry. More than a century ago, a large extent of clay-land was drained at narrow intervals in Norfolk and Essex, by putting in brush-wood and even straw in the bottom of the drains. The progress of draining, which is now regarded in many soils as essential to economic culture, was slow and partial, until Mr. Smith of Deanston (well on in the 19th c.) reduced the practice to a system, and showed the principles upon which its efficiency depended. Through the exertions of this advocate, furrow draining soon became a *sine quâ non* in the culture of clay-soils, or indeed any soil, in moist climates.

Practical men consider the line of greatest fall, or quickest descent, as the best for cutting drains in a field. The smaller drains are usually conducted into larger or *main* drains, instead of each discharging its quota of water into the open ditch. This is rendered necessary, as the mouths of the smaller drains would be more liable to be choked up by the growth of weeds; while the collecting of water into main drains secures a fuller flow to sweep out any matters which might accumulate where the discharge was small. Moreover, the less of the action of the air in the drains, the more efficient they are.

The most efficient, and at the same time cheaply cut drain, is made so that a pipe of a cylindrical form may be laid along the bottom, which need be of no greater width than what is necessary to allow of the pipes being properly laid.

Drains of this form are cut with a set of spades which are of different widths—the broader being used for taking out the top, and the narrowest for the bottom. The one which cuts the last spit is called the *bottoming tool*, and its introduction has effected a considerable saving in cutting drains. The pick has often to be used, too, where the subsoil is hard. The cutting of drains is heavy, crushing work. Men employed at this sort of labor are generally paid by the piece; and a professional will make rather above the ordinary rate of laborer's pay. One not accustomed to drain-cutting finds it for some time very hard labor; but experienced hands prefer draining to trenching.

Before the general use of pipes, stones were the common materials with which drains were formed. Mr. Smith recommended that they should be broken so small, that they might pass through a ring two inches and half in diameter. From nine inches to a foot in depth was the quantity which was commonly put in. Where stones can be easily got, they are still preferred to tiles, as cheaper, and if well put in, more efficient and durable. The best plan is to set a pretty large block at each side of the bottom of the drain, and then use a third as a sort of wedge. A coating of smaller stones is surmounted by some turf and the muck.

When tiles and pipes were first used, it was even thought necessary to have some gravel, or small stones, placed above them in the drains, for the purpose of enabling the water to find its way into them. It was soon found, however, that tile drains were quite as efficient without any stones or gravel; and that they were less liable to be choked up, as the clay or earth acted as a filter in preventing the intrusion of any kind of solid matter.

Many kinds of tiles and pipes have been tried, but the cylindrical form is most used. At one time, a bore in the tile of an inch in diameter was thought sufficient, but 2-in. tiles are now preferred. They are usually made about 15 in. in length. The continuity of the drain is maintained completely by *collars*, which should always be used as a means for securing efficiency and permanency. In soft mossy or clayey subsoils, semi-cylindrical tiles called muggs have been laid, with the bend up, on lath. This is expensive, but is necessary in some cases.

Much discussion has taken place in regard to the proper depth of drains, as well as the distance at which they should be placed. Mr. Smith at first advocated the making

of drains from 2½ to 3 ft. deep, and at intervals of from 10 to 40 ft., according to the nature of the land. Experience, however, has been gradually favoring deeper drains, at wider intervals. Even on the most tenacious soils with subsoils of *till*, few now think of having drains less than 3 ft. in depth, though the distance apart should not in many cases be more than from 15 to 18 feet. The depth, however, depends greatly on the soil—3½ and 4 ft., with the leader drains 6 in. more, are common dimensions. In mossy land the depth has sometimes to be 7 feet. The width between drains depends on the wetness of the land and the character of the subsoil.

The mere tenacity of clays is not the element which determines the depth of drains, or the distance at which they should be placed apart. It is now well understood that the success of draining by pipes depends upon the fissures which are produced in the subsoil by the droughts of summer never entirely closing up; and thus minute channels are formed, which lead the water into the drains. As the properties of clays become better understood and classified, practical men come to be more at one in regard to this important point connected with the economy of drainage.

The principal advantages of D. are, the deepening of the staple soil, and rendering it more friable, so that a superfluity of water, which would cause the formation of those chemical compounds that are found in stagnant water, is prevented. The greater depth of mold, and more perfect culture, render the soil more absorbent of moisture in dry weather. As crops can usually be sown sooner on drained lands, they also ripen earlier, and produce more abundantly. In short, while drained land obtains a greater capacity for moisture and manure, it imparts to plants greater capabilities for economically working up the materials which they find in the soil and atmosphere, seeing they are maintained in the most healthy conditions of growth.

D. in its various forms has, as is well known, not only improved the fertility and value of land in Scotland, but materially changed the aspect and climate of the country. Mosses and wet rushy lands have been transformed into dry and productive fields, while by the removal of all superfluous pools, the air is freed from those hovering vapors which are injurious to general amenity and salubrity. To the farmer, the more immediate advantage of D. consists in that rapid running off of the water which falls as rain, so as to admit of working lands without any undue delay, while natural springs and dampness, from whatever source arising, are also run away with wonderful success. In short, subsoil D. has been perhaps the most valuable improvement connected with British agriculture.

DRAINAGE-TUBES, in surgery, are a recent but important addition to the surgical appliances for which this profession is indebted to a distinguished French surgeon, M. Chassaignac. They are composed of India-rubber, from ¼th to ⅜th in. in diameter, perforated with numerous holes, and of various lengths. They are especially useful in chronic abscesses (which it may be unadvisable to empty at once) and empyema (q.v.), but also in large wounds, such as those made by amputation, and in all cases where there is apt to be a deep accumulation of discharge. They are introduced in such a manner that one end is on a level with, or projects above the skin; the other is in communication with the seat of discharge; and by allowing that discharge constantly to escape from the external wound, they diminish both chemical irritation from putrid accumulation, and mechanical irritation from pressure. Like all new inventions, it has its advocates and opponents. Thus, while sir William Paget, in his article "Sinus and Fistula," in Holmes's *System of Surgery*, says that "*drainage*, for which the perforated caoutchouc-tube of M. Chassaignac is a very happy invention, is applicable to a great number of cases; but chiefly to those in which a sinus or incomplete fistula depends mainly on pus collecting at a level below or distant from the aperture of discharge, or more generally, when pus is apt to be retained."—Sir William Paget's surgical colleague at St. Bartholomew's hospital, in his article "Abscess," which immediately precedes that from which we have just quoted, objects to the drainage-tube on the grounds that, as a foreign body, it sets up irritation, and adds that "if a proper opening be made, there can be rarely any occasion for a drainage-tube; and however carefully it is inserted, it must of necessity inconvenience and distress the patient." Notwithstanding Mr. Coote's objections, drainage-tubes are now very generally used in surgical practice.

DRAKE, DANIEL, 1785–1852; a physician; b. N. J.; graduated at the university of Pennsylvania, 1816. In 1818, he founded a medical college in Cincinnati; also a commercial hospital. In 1823, and following years, he was professor in medical colleges in Philadelphia, Louisville, and Cincinnati. He wrote *An Historical and Scientific Account of Cincinnati;* and *A Systematic Treatise, historical, etiological, and practical, on the Principal Diseases of the Interior Valley of North America, as they appear in the Caucasian, African, Indian, and Esquimaux varieties of its Population.*

DRAKE, Sir FRANCIS, was b. about the year 1539, in a cottage on the banks of the Tavy, in Devonshire. His father was a yeoman, and had a family of twelve sons. He was a zealous Protestant, and during the persecution under queen Mary, he fled from Devonshire into Kent, in which co. his family was brought up. He obtained some kind of clerical appointment among the sea-faring men of the district, and in consequence, D.'s younger years were passed among sailors. He was at an early age apprenticed to

a neighbor of his father's, who possessed a bark, and occasionally made voyages to Zealand and France. When his master died, D. fell heir to the vessel, and carried on the old trade with considerable success. While coasting about, he heard of the exploits of Hawkins in the new world, and the recital took such a hold of his imagination, that selling his ship, he proceeded to Plymouth, and joined Hawkins in his last expedition to the Spanish main. The adventure was disastrous to all concerned, and D. came home much poorer than when he set out. Undismayed, however, he gathered around him wild and reckless spirits, and having raised sufficient money, they fitted out a vessel, and under the command of D., made several voyages to the West Indies. In 1570, he obtained a commission from queen Elizabeth, and cruised in the West Indies, enriching himself with plunder. In 1572, he again sailed for the Spanish main, and, assisted by some other English ships, he plundered the town of Nombre de Dios. He then crossed the isthmus of Darien, and beholding the Pacific, prayed God to grant him leave to sail an English ship in that sea. On Sunday, the 9th Aug., 1573, he came into Plymouth laden with spoil; and when the news spread of his arrival, the people forsook the preacher, and came out to gaze on the brave and successful sea-rover.

Under the sanction of queen Elizabeth, D. again set sail in 1577, taking with him five vessels. He sailed to South America, and plundered the coasts. In Sept. of that year he entered the Pacific. During his voyage, he was singularly successful. He sacked the Spanish towns on the coasts of Chili and Peru, and he captured a royal galleon laden with plate. He then steered for the n.e., hoping to find a passage back to the Atlantic; but the severity of the cold discouraged his crew, and he took shelter in Port San Francisco. He stayed there several weeks, and formally took possession of the country in the name of the queen of England. He then steered across the Pacific for the Moluccas; reaching Ternate, he sailed for Java, thence he stretched right across the Indian ocean for the cape of Good Hope, which he doubled in safety, and arrived at Plymouth on Sunday, the 26th Sept., 1579. He was graciously received at court. Elizabeth banqueted on board his vessel, and conferred on him the honor of knighthood.

During part of 1585 and the whole of 1586, D. was employed, with a fleet of 21 ships, against Philip II. of Spain, chiefly in the West Indies and the coasts of South America. In this, as in his former voyages, he plundered many towns, and enriched himself with spoil. During this voyage, he visited Virginia, which colony had been recently planted by Raleigh. Thence he returned home, and it is said brought tobacco with him.

Spain was now preparing an armada for the invasion of England, and Elizabeth sent D. with a fleet of 30 sail to destroy the enemy's ships in their own harbors. He entered the roads of Cadiz, passed the batteries on the morning of the 19th April, 1587, and before night, destroyed 100 vessels, and possessed himself of immense booty. He then sailed along the coast, burning and plundering. He entered the Tagus, and flouted the marquis Santa Cruz, who was lying in that river with a large force of galleys. Having done all the mischief in his power to Spain, D., with that keen appetite for plunder which never forsook him, steered for the Azores, on the look-out for homeward-bound treasure-ships. He was fortunate enough to encounter a richly laden carrack, of which he took possession. On his return, he spent a considerable portion of his prize-money in supplying the town of Plymouth with water.

D. was next employed as vice-admiral in the fleet under lord Howard, which scattered the armada, and broke the naval supremacy of Spain. In 1589, he was sent to Portugal with a fleet, to expel the Spaniards, who had taken possession of that kingdom; but the expedition was unsuccessful. On his return, he was elected member of parliament for Plymouth. In 1595, along with sir John Hawkins, he was sent with a fleet to the West Indies. In the course of the expedition, the commanders quarreled. Hawkins died before reaching Puerto Rico. Attacking the place, D. received a repulse. Sailing away, he burned and plundered several towns. He came to anchor in Nombre de Dios, where a deadly disease broke out among the soldiers and sailors of the fleet. D. was at last smitten, and after struggling 20 days with the malady, he expired on the 27th Dec., 1595. On the day of his death, the fleet anchored at Puerto Bello, and there the bold sailor and buccaneer received his sea-funeral.

DRAKE, FRIEDRICH, a celebrated German sculptor, b. at Pyrmont, 23d June, 1805, and trained under Rauch of Berlin. Among his principal works are a "Madonna with her Infant" (purchased by the empress of Russia), a "Dying Soldier," a "Vintager," "The Eight Provinces of Prussia" (colossal allegorical figures, adorning a hall in the royal palace at Berlin), and a "Warrior crowned by Victory," which is reckoned one of the masterpieces of Prussian sculpture. But D. owes his celebrity chiefly to statues, busts, and medallions. There are few great countrymen of his of whom he has not preserved a marble memorial. His statues of Schinkel, the two Humboldts, Rauch, Justus Moeser, his bust of the naturalist Oken, his two colossal statues of Frederick William III., king of Prussia, and that of the emperor William I. at Cologne, deserve especial mention; as also the busts of Bismarck and Moltke, and the figure on the victory column at Berlin. D. is professor of sculpture in the academy of fine arts at Berlin.

DRAKE, JOSEPH RODMAN, 1795–1820; b. N. Y.; one of the early American poets. He studied medicine, graduated, and married a daughter of Henry Eckford, the ship-builder, an alliance which raised him from poverty to affluence. In 1816, he wrote *The Culprit Fay*, a highly imaginative poem. In 1818, he was in Europe. The next year, in conjunction with Fitz-Greene Halleck, he wrote poetical satires for the *New York Evening Post*, over the signature of "Croaker and Co." He is best known as the author of *The American Flag* (of which Halleck is said to have contributed the last four lines), which many critics consider to be our best national poem.

DRAKE, SAMUEL GARDNER, 1798–1875; b. N. H.; in early life a school-teacher. In 1828, he established in Boston an antiquarian bookstore, the first of the kind in the country. He was one of the founders of the New England historical and geological society, of which he was president in 1858. In 1847, he started a quarterly *Register*, of which he was for many years the editor. Among his publications are a number of books on Indian history and wars, on genealogy, and on witchcraft; but the most important is his very full *Dictionary of American Biography, including Men of the Time*, containing 10,000 notices of persons of both sexes, of native and foreign birth, who have been remarkable or prominently connected with the arts, sciences, literature, politics, or history of the American continent.

DRAMA (Gr. *drama*, from *draō*, I act), or dramatic poetry, in it most general signification, represents *actions*, which are not stately narratives, as in epic poetry, or which do not aim at the musical expression by language of mental emotions, as in lyric poetry. The D. consists of an impersonal representation, by the dramatist, of an animated conversation of various individuals, from whose speech the movement of the story is to be gathered. Thus, it is contrasted, on the one hand, with dialogue, or the dull and changeless flow of discourse, and on the other, with every other species of poetry, whether epic or lyric. In simple dialogue, the minds of the speakers remain unchanged; in the D., the movement of the thoughts is so lively, and the expectation of the issue so vivid, that this species of poetry surpasses every other in interest and in intensity. In epic poetry, persons are frequently introduced engaged in lively conversation, and this is sometimes the case even in lyric poetry, but the prevailing tone of the epopee is descriptive and indirect. A novel, or an epic poem, can only be described as dramatic when it abounds in animated conversations, or when direct action prevails over description. All dramatic poety may be divided into *tragic* and *comic*. Tragic poetry has for its aim to interest the earnest mind, while comic poetry merely endeavors to produce amusement. Tragic poetry may be described as that which interests the mind in the highest degree possible, and comic poetry as that which engages it in the most complete lawlessness. In comedy, gloom, sadness, sobriety have no recognized existence; while in tragedy, gayety, joviality, riotous mirth are unknown.

While the D., doubtless, arose from that natural love of imitation peculiar to man, and from the child-like liveliness with which a simple narrator loves to recount anything which he has heard or seen, yet the creation of dramatic composition was, nevertheless, a feat of singular boldness. This arises from the wide difference there is between the disjointed elements of occasional imitation and the perfect invention of the genuine drama. The Old Testament, no doubt, contains numerous instances of dramatic dialogue, as in the book of Job; and of lyric poems placed in a dramatic connection, as Solomon's Song; but there is no instance in Hebrew literature of the existence of the D. properly so called. The Hindus have an early dramatic poetry, but, unfortunately, this poetry only dates back to a time when the intercourse between Greece and India was close and frequent. It is to Greece alone that we, accordingly, must look for the invention of the D., and to Athens, in particular, for its perfection. But even here it was originally exhibited only at a few festivals of a single god, Dionysus. There can, then, be no doubt that the origin of the D. is to be sought for in the enthusiasm attendant on the worship of Bacchus. The ancient Greek writers tell us that the D. originated in a choral song; and Aristotle (*Poet.* 4), that it had its origin in the singers of the dithyramb. Supposing that it originated in the pantomimic dances, the dramatic art, like every other, was only slowly purified from extraneous mixtures. Even the origin of the word tragedy has been disputed, although the inventor of it, Arion (580 B.C.), the celebrated dithyrambic poet, is known. Tragedy (*tragōdia*, from *tragos*, a goat, and *ōdē*, a song) is said to have taken its rise from the fact of the old dramas being exhibited when a goat was sacrificed, or because a goat was the prize, or because the actors were clothed in goatskins. Comedy, again (*kōmōdia*, either from *kōmos*, a revel, or *kōmē*, a village), signifies, literally, either the *revelers' song* or the *village song*, from the practice of strolling-players publicly exhibiting their dramatic skill about the streets. Thespis (536 B.C.) introduced the regular dialogue into the choral representations, and joined a person to the dithyrambic songs, who was the first actor. Phrynichus (512 B.C.) used this single actor of Thespis for the representation of female characters, although with him the lyric element predominated over the dramatic. No further improvement of any note was introduced into tragedy before the time of Æschylus.

Comedy, again, arose about 580 B.C., with Susarion, who traveled about through Greece, ridiculing, from a small movable stage, the follies and vices of his time. Tragedy, from its first recognition, was deemed worthy, by reason of its superior

gravity and staidness, to entertain the refined inhabitants of cities; while comedy, at the outset, from its riotous fun and jollity, was judged more in harmony with the rustic habits of the country people. In time, comedy made its way into the city, and Epicharmus (485 B.C.), besides modeling this form of dramatic wit, after its more successful rival, tragedy, likewise introduced a number of distinguished comedians to the notice of the Athenians. Phormes, Magnes, Crates, Cratinus, Eupolis, Pherecrates, and Aristophanes are the highest names in connection with the old Greek comedy, the last mentioned being, however, by far the greatest. Tragedy, both from its ideal character, and from the stately cothurnus and long masks in which the actors of it appeared, aimed at a representation of what was dignified, noble, and grand in human nature. Comedy, again, from its style of caricature, its low-heeled sock, and its grotesque masks, tried to degrade humanity beneath its natural level. Comedy, during the Greek period of its history, divides itself into three forms, viz.: old comedy, middle comedy, and new comedy. The old comedy is the directly opposite of tragedy; its form is essentially sportive, and a seeming aimlessness reigns throughout it. It is, in the opinion of A. von Schlegel (*Lectures on Dramatic Literature*), the only genuine poetic species of comedy, while the other forms of it show a tendency to decline into prose and matter of fact. In the new comedy, again, the form is rather serious than otherwise, and it is regularly tied down to the accomplishment of a certain aim. This is what is understood by comedy at the present day. It is a mixture of tragedy and comedy proper, of earnestness and mirth. Only fragments of Menander and of Philemon, the genuinely witty poets of the new comedy, have come down to us. The middle comedy, again, which came in between the old and the new, arose after the termination of the Peloponnesian war. The new oligarchy strictly prohibited the introduction of living persons by name on the stage; and the chorus, till then the chief instrument of vituperation, is said to have been abolished.

With Æschylus, Greek tragedy properly begins. He instructed his actors himself in the rehearsal of his pieces. In his dramatic compositions he aimed more at sublimity than beauty, more at the heroic than the human. Sophocles, again, who was, perhaps, superior to Æschylus in his appreciation of human nature, strove more to depict idealized men than to paint heroic excellence. He introduced a third actor on the scene, and materially improved the mechanism of the stage. Euripides was too much of a nice speculator to attain to the highest forms of poetic expression. Instead of quietly contemplating life as Sophocles did, he seems to have been morose and peevish; but in point of moral denunciation, no dramatist surpasses him. With these three great poets, Greek tragedy may be said to close. With them it ceased to be the tragedy which Aristotle has described in his celebrated definition of it. "Tragedy," he says (*Poetics*, 6), "is the imitation of some action that is serious, entire, and of a proper magnitude; effecting, through pity and terror, the refinement of these and similar affections of the soul." In the hands of the subsequent authors this form of the D. grew lax and effeminate, and in the performances of Theodectes especially, tragedy was made to give way to rhetoric. (See the works of Böckh and Welcker on the Greek tragedians; also, Müller's *Literature of Ancient Greece*.)

The Romans were not a great dramatic people. They borrowed, according to the common account, during a period of national despondency occasioned by a desolating pestilence (A.U.C. 391), their first idea of a play from the Etrurians; their effusions of sportive humor, their *Fabulæ Atellanæ*, from the Oscans; and the higher class of dramatic compositions from the Greeks. Philology, likewise, countenances this story; for *histrio*, the Latin word for a player, is pure Etruscan. No remains of any note have come down to us of the comic writers of Rome, except Plautus and Terence. The former was a poor day-laborer, the latter a Carthaginian slave. The habits of each appear in their writings. Plautus has a degree of rough vigor and broad jocularity, born of the handmill and the plow, while Terence is more refined and delicate in his wit and characterizations. Both these writers borrowed largely from the Greeks. Of the early period of Roman tragedy no remains exist, but it is probable that its poets were merely translators or imitators of Greek models. The tragedians of the Augustan age were ambitious of rivaling the Greeks. Unfortunately, none of these grand attempts have come down to us, except ten bombastical and frigid dramas, that go under the name of Seneca.

Ancient art fell with pagan Rome. In the early ages of Christianity, any one connected with the theater was not allowed baptism. The unwise zeal of the fathers was followed by an edict of the emperor Julian to the same effect. The two Apollinarii, father and son, and Gregory of Nazianzen, attempted to introduce religious plays or mysteries, drawn from the Scriptures, to amuse the Christian people during the operation of Julian's law. In a short while, instead of the D. proper, there was nothing to lighten up the surrounding darkness but such productions as the saturnalian pageants, the Feast of Fools and the Feast of the Ass.

The Italians are the first people of Europe, who, after the long sleep of the true dramatic spirit in the middle ages, strove to enkindle the ancient fire upon Roman hearths that had for long years been cold. Early in the beginning of the 16th c., the first regular modern D. was published. It was called *Sophonisba*, and the writer was a very commonplace author, by name Trissino. Shortly after, this tragedian was followed by

Ariosto, by Babbiena, and by Macchiavelli, all distinguished cultivators of the classic comedy. Towards the end of the century, Giambattista de la Porta, philosopher and comic writer, exhibited a number of pieces of a familiar, and sometimes even farcical kind, but full of happy invention and agreeable originality. The political influence of Spain was now at its height on Italian territory, and the romantic D. of the west gradually found favor in Italy. Even so early as 1529, Ricchi had attempted to overthrow the classic taste in Italy, but without success. It remained for Borghini, Oddi, and M. A. Buonarroti, the nephew of the great artist, and one or two other writers, to break in upon the current taste, and to do much to introduce the romantic D. in Italy. In the 17th c., Rinuccini, by the union of music with the romantic D., succeeded in establishing the *melodrama*. Tragedy and comedy were now entirely laid aside as antiquated, and nothing but the *musica opera* was heard of from Milan to Ravenna. Maffei led the way in reforming the Italian stage. The political preponderance of Spain had now given way to that of France, which facilitated his labors not a little. His *Merope* is a fine attempt to restore the tragic D. to Italy, but as Lessing says of it, in his *Dramaturgie*, it is rather the production of a "learned antiquary" than of a great tragic poet. The musical D. had now to be rendered classic, and this task was undertaken by Zeno and Metastasio. The latter, who has all the attractiveness for the Italians that the classic Racine has for the French, by subtle harmony and grace in his songs, by his power of painting pathetic situations, and by his melting effeminacy of manner, charmed the hot southerners as no other poet yet had done. After Goldoni, a great comic authority in Italy, and a careful student of Macchiavelli and Molière, except Riccoboni and Gozzi his rivals, we have few dramatists of any note till we come down to last century. The bold and passionate Alfieri inaugurated a new era in Italian tragedy. He is a follower of the classic school, and a strict observer of the Aristotelic unities. His successors have relaxed more their adherence to classic forms, and have produced some very admirable dramas. Among the most estimable of those writers are Monti, Manzoni, and Niccolini.

In the other European nations as soon as dramatic composition rose to any degree of purity, it became thereby disconnected with the church. But in Spain this is by no means the case, for their best poets, while writing for the stage, have busied their pens in the composition of religious dramas. Passing over the names of Villena, Santillana, Naharro, and Rueda, as diligent but comparatively weak builders of the fame of the Spanish D., we come to the periods of Cervantes, of Lope de Vega, and of Calderon, when the Spanish stage may be regarded as in its best condition. In his *Numantia* particularly, Cervantes, whose genius was more decidedly epic than dramatic, has left to the world a specimen of tragic invention and of moral dignity which it is not likely to forget. While the critics were clamoring about the classic rules and the Aristotelic unities, Lope de Vega appeared on the scene, to set nearly all the dramatic laws at defiance. He is the most fertile dramatic writer in the world, besides being one of the best. Yet he prostituted his pen to serve the public, and sacrificed his future fame to his living popularity. Calderon, who succeeded him, possessed all his advantages, with the important additional merit of being thoroughly devoted to dramatic art as to a mistress. So great was Calderon reckoned in the composition of religious plays, that by letters-patent he enjoyed a monopoly of these productions for 37 years. The brilliant period of the Spanish theater, comprising the first half of the 17th c., had with the death of Calderon well-nigh closed. Except Moreto, Tirso de Molina, and Solis the historian, there is no writer of any note to engage the attention.

We come now to France, where the unities, as they are called, have been observed with as much strictness as if the country had been an old Grecian province. This is chiefly owing to the influence of the criticisms of Boileau, who adopted the dramatic unities in all their severe rigor. The critics of other nations, particularly of Germany and of England, have chosen to contemn this exposition of the D., and sometimes to despise even the Stagirite as a dramatic critic. The dramatic unities are threefold—action, time, and place. According to the French, these unities have the following significance: 1. That the action of the D. must be one—that is, that the interest or attention must not be distracted by several plots, but everything must be subservient to the main action. 2. That all the actions must take place on the same spot, or very nearly so, in order that the illusion may not be disturbed; and 3. Everything should happen on the same day for the same reason. Much has been written for and against these rules. Suffice it to say, that these are the landmarks on which the classic dramatist fixes his eye. Previous to Jodelle, or indeed to Corneille, hardly any progress had been made in the regular D. in France. A number of writers, of more or less ability, had produced *mystères, soties, moralités, farces*, in which, in numerous instances, the romantic or anti-classical tendencies of human nature had manifested themselves; but neither in the case of the brethren of the Passion, nor in the case of the *Enfans sans Soucis*, was there any progress made in the proper business of dramatic composition. Jodelle was the first writer who composed a regular five-act tragedy, and he publicly exhibited it in the presence of the court of Henry II. of France. He composed other pieces of equal, many of superior, merit, but nothing of any importance in the D. appeared before the time of Corneille. This writer, who appeared in the reign of Louis XIV., during the time that the star of Richelieu was in the ascendant, had to humor the court by humor-

ing the academy, and to please the academy he required to observe the rules of Aristotle. He produced seven plays, as cold and as severe as if they had been written by Sophocles, but of great elegance and dignity of style, when it struck him that he might give more free scope to his romantic tendencies in the tragedy of the *Cid*. All Paris rang with its praises, but the academy gloomed, and poor Corneille had to betake himself again to the dignity and severity of the Greek drama. He got what he longed for, however—a seat among the members of that institution which had been so instrumental in repressing the spontaneous outflow of his genius. It was more than his successor, Molière, obtained, who insisted to the last on playing his part as well as penning his pieces—an abuse which the dignified academicians could by no means tolerate. The genius of this dramatist was decidedly comic, and it may perhaps be questioned, whether, in all the essentials of true comedy, Molière's is not the very foremost name in the history of the stage. He borrowed much from the Spaniards, though perhaps less than Corneille; a great deal from the Latins; and more perhaps from the Italians. But the favorite tragic poet of the court of Louis XIV. was Racine. His genius lay decidedly towards the serious and the exalted, so that he had no temptations, like Corneille, to trespass the bounds of the academic proprieties. In tenderness and elegance, all French writers give way before him. In his *Athalie*, his last and best D., he gave to the Parisian public a composition, such as in breadth, in elegance, and in severe grandeur, it could nowhere find out of the Greek theater. But we must push through the crowd of lesser lights which shone on the decline of Racine and Molière, and glance at that bright and fitful luminary—Voltaire. He pressed boldly forward, and astonished all Europe with the force and power of his romantic dramas, a style of composition which, since the *Cid* of Corneille, had been altogether excluded from the theater. His spirit of intolerance was perhaps felt in his dramas, and his increasing warfare with superstition and fanaticism was too distinctly experienced even in the theater. But his genius and spirit have earned for him a place beside Corneille and Racine as one of the tragic names whom France delights to remember. Boursault, Regnard, Legrand, Lemercier, Victor Hugo, Dumas, and Alfred de Vigny, would all require to be noticed in a full view of the French drama.

The German D. is almost wholly dependent for its fame on the names of Lessing, Goethe, and Schiller. For while Rosenpluet, Hans Sachs, and Ayrer were original, and some of them fertile; while Gryphius, Gottsched, Gellert, and Schlegel show a decided advance in the appreciation of the laws of dramatic composition; yet from the feebleness of the writers, and from the backward state of theatrical taste in the end of the 17th and the beginning of the 18th centuries, very little was done towards a clear and distinct recognition of the excellence of dramatic literature, till the critic Lessing, in his *Miss Sara Sampson*, taught Germany to appreciate the productions of the romantic drama. As a critic, he blamed the French, praised Shakespeare, and professed belief in Aristotle. He held more than one dramatic heresy, and his antipathy to versification was among the number. Goethe is, without doubt, one of the greatest geniuses which the world has seen, but whether he is entitled to so high a place for his theatrical dramas remains an open question. As his aim was more emphatically the culture of his genius in its fullest form, the circumstance of his writings assuming the dramatic form is rather an accident than otherwise. From first to last he seems to have been distinctly aware of this, and in the prologue to his last, and by far his grandest production, he declares why he could not accommodate his genius to the demands of a mixed theater. Yet his *Faust* must ever be regarded as one of the grandest and most remarkable compositions which modern Europe has witnessed. Schiller was more expressly the dramatic poet of Germany than Goethe. While Goethe's genius was fuller and more complete, Schiller made up for what he wanted in breadth of vision by the moral intensity of his genius. From his wild play of the *Robbers*, down to his last D. of *Wilhelm Tell*, he worked with a vehemence such as has very seldom been witnessed. But he filled Germany, and indeed all Europe, with his tragic fame, and his name is one which "posterity will not willingly let die."

Dramatic exhibitions in England, if they did not originate in the church, were nevertheless speedily appropriated by the clergy. Ecclesiastics were frequently the composers of the religious pieces, or mysteries, and they were found not seldom to be the actors. The mass of the people, no doubt, owed a good deal of grotesque amusement, and even of occasional information, to the Biblical and legendary history, which those rude attempts at the D. were fitted to convey. Those old religious plays are generally divided into two classes—*miracles* or miracle-plays, and *moralities* or morals. The former were founded on Scriptural narratives, or on the legends of the saints; the latter arose from the former, by the increased introduction of imaginary features. These pious pastimes existed long before the reformation, and were not overthrown by that great revolution in the opinions and beliefs of the country. See MIRACLE-PLAYS and MORALITIES. It was about the middle of the 16th c. that the D. extricated itself completely from these ancient fetters. By this time both comedy and tragedy had begun to exist in a rude reality in England. The oldest known comedy (before 1557), that of *Ralph Roister Doister*, was written by Nicholas Udall, a school-master of considerable learning, probably about the middle of the 16th century. Ten years after appeared our first tragedy, known variously as *Gorbudoc*, or as *Ferrex and Porrex*, by Mrs. Norton and lord Buckhurst. And not only is this work the earliest tragedy in our language; it con-

tains, beside, the first application of blank verse to dramatic composition. But the play is dull, heavy, and declamatory. The D. lingered in this incipient condition until very near the time of Shakespeare. Bishop Still's *Gammer Gurton's Needle* is no improvement on *Roister Doister*. The names of Kyd, Lodge, Greene, Lyly, Peele, Marlowe, Nash, etc., must pass before us almost without comment. Many of these writers are not without their merits, particularly Marlowe, whose plays of *Edward II.* and of *Dr. Faustus* are acknowledged by Charles Lamb to contain passages that Shakespeare himself has not surpassed. Marlowe, besides, is the first author who introduced blank verse upon the *public* stage. But all these dramatists are obscured by their nearness to the great luminary of the English drama. Shakespeare is now almost universally acknowledged to be the greatest dramatic genius that has ever appeared in the world. He brought the romantic D. to a perfection which it is not likely to surpass. His writings present the finest example of the depth, sublimity, refinement, and variety of which the D. is capable; and they are abundantly marked by those peculiar characteristics which sprung from the union, in the person of its author, of such wonderful powers of conception with such familiar experience of theatrical management. Of course he despised the unities, or rather, we might say, he worked in ignorance of them, for he knew nothing of Aristotle and Boileau; and the rest of the French critics were not born when he died. Hence his D. is known in literature as "irregular;" and, we fear, human nature is likewise very irregular. The poet trusted to his own instinctive judgment, and of its exercise we have all fortunately plenty of examples. The principal of Shakespeare's contemporaries are Ben Jonson, and Beaumont and Fletcher. Like Shakespeare, Jonson wrote both tragedies and comedies. Milton speaks of "Jonson's learned sock," and thus hits off the main feature of his character as a dramatist in a phrase. Beaumont and Fletcher, who were, like many brotherly men in that age, joint-workers, have the honor of standing next to Shakespeare in the romantic D. of England. But, like Lope de Vega, they wrote too much for the mere success of the moment to be ranked in the foremost file of England's dramatic writers. With Massinger, Ford, and Shirley, the old English D. is closed. Dryden, the literary chief of his age, who flourished during the latter half of the 17th c., wrote some fine pieces of Frenchified declamation. Lee, and the unfortunate Otway, bring down the D. to the beginning of the 18th century. For, while Gay, Congreve, Cibber, Wycherley, Vanbrugh, and Farquhar, all display considerable dramatic spirit and invention, their works are, nevertheless, morally considered, the foulest things in the language. They paint well the externals of society, and have left behind them good specimens of the "comedy of manners," as it has been called; but vice is both warp and woof of nearly everything they have produced. Addison, Johnson, Young, Thomson, etc., wrote some good poetry, but poor dramatic verse; while Lillo, Moore, Garrick the actor, Goldsmith, the Colmans, and Cumberland, nearly all took to prose instead of verse. They produced agreeable comedies, but nothing of a very marked kind in the history of the D. appears until the time of Sheridan who gave an impulse to "genteel comedy," such as has placed him ever since at the head of the writers of that species of composition. Holcroft, Mrs. Inchbald, "Monk" Lewis, and Maturin, mostly influenced by inferior German writers, have left behind them a legacy of terror and of wonder fit to render their period marvelous, if for nothing else. Joanna Baillie and Sheridan Knowles remind the reader of the excellences of the old English D., and the *Lady of Lyons* of Bulwer Lytton is a favorite with playgoers of the present day. Byron, Coleridge, and Henry Taylor are the authors of fine meditative dramas, but they are more suitable for the closet than for the stage. Our sketch would not be complete without allusion to Talfourd, Jerrold, Shirley Brooks, Marston, Tom Taylor, Charles Reade, Robertson, Wills, H. J. Byron, and Gilbert. Swinburne, Tennyson, and Browning have also written works in the dramatic form.—See Ward's *History of English Dramatic Literature* (London, 1875).

DRAMA (*ante*). In the United States it is difficult to separate the English and American drama. The sameness of language, the similarity of dramatic themes, and the free and constant intermingling professionally of American and English artists, make a homogeneous whole rather than separate branches. The literature of the drama in the United States is very extensive; but, as in England, a great proportion of it is of little value. It was some time after the establishment of independence before the dramatic muse began to work; and the earliest productions were naturally based upon our warlike achievements, the glories of our battle-fields, the invincible courage of our heroes, and the ignominious defeats of the enemy. It scarcely needs be said that such dramas, following like shadows upon events so recently passed, were veritable trash, not only in a literary but in an acting view. Centuries must roll by ere Lexington, and Saratoga, and Yorktown can become fit subjects for dramatic treatment. Shakespeare's historical plays took little hold of the English public until Garrick entered into the body and soul of Richard III., three hundred years after Bosworth field and a century after the death of the swan of Avon. The first theater to open after the departure of the British troops was that in John street, New York, 1785. All the players of note were English, and so were the plays. The first play by an American author presented on the stage was *Contrast*, written by Royal Tyler, afterwards chief-justice of Vermont. It was a poor affair, but served to introduce to the boards that abomination known as the

exaggerated "Yankee," which could not be banished for three quarters of a century. William Dunlap was the first prolific American dramatist, some of whose work was fair for the period, while much more of it was poor. He produced about fifty plays, some of which were translated from the German. The building of the Park theater, New York (opened Jan. 29, 1798), gave the drama a fresh start, although all the chief players were from the old country, and the opening play was *As You Like It.* On Jan. 24, 1809, "the American Roscius" made his début on the Park stage as "Young Norval," following with more solid characters. This lad was John Howard Payne. He wrote and translated a number of plays, of which his own tragedy *Brutus, or the Fall of Tarquin*, still keeps the stage. It is a powerful, well-constructed tragedy, and bears comparison with those of any English writer excepting only Shakespeare; moreover, it is the first drama of importance written by an American author. It was not until about 1820, that literary and cultured people began to look with favor upon the drama. The Park theater was burned in May of that year, but was rebuilt and opened in Sept., 1821, when Charles Sprague, then among the foremost of native poets, wrote the inaugural address, and Samuel Woodworth, another poet of high standing and also a dramatist, wrote the prize poem. Soon after this period, play-houses began to multiply, and the solid phalanx of English artists was now and then broken by the invasion of American players, none of them, however, destined to achieve greatness. There were some who rose to local celebrity; such as Rosalie Pelby, Anne Jane Henry, Caroline Placide, Alexina Fisher, then a mere child, and Julia Wheatley, a singer. Further impetus was given to the American drama by the presence of the great tragedian Edmund Kean, who played two short engagements in New York and Philadelphia. Opera also began to appear in force under Signor Garcia and his daughter Felicité, afterwards the renowned Malibran. In 1826, James K. Hackett made his first appearance as "Sylvester Daggerwood." He became famous in "Falstaff" and "Monsieur Tonson," in Yankee parts, and especially in "Sir Harcourt Courtly." Kean was hardly gone when Edwin Forrest made his first effort in a Shakespearean part as "Othello," June 24, 1826. Forrest is held in memory by a large majority of his countrymen as the greatest of American tragedians. The two Wheatley families (one English and one American) were coming into prominence about this period. Forrest, always intensely American in feeling, undertook to infuse the native idea into his work. He appeared in John A. Stone's *Metamora* (written for Forrest), and especially engaged Dr. Bird of Philadelphia to write a new play. The result was *The Gladiator*, a Roman episode removed as far as possible from this new world. Bird also wrote *Oraloosa*, another Indian piece. Stone was a native of Massachusetts, and the author of *Fauntleroy; Tancred of Sicily; Laroque, the Regicide;* and other dramas. He committed suicide when but 33 years of age. In 1830–31, two noted delineators of Yankee parts appeared in Danford Marble and George H. Hill, and were popular in a low grade of plays for many years. The season of 1832–33 brought over Charles and Fanny Kemble, who enjoyed immense popularity. The year before, the celebrated Ravel family had taken the people by storm, but they had no connection with the drama. In the spring of 1833, again appeared the great and erratic Booth, father of Edwin. He had appeared first in the United States, Oct., 1821. "Master Burke," or Charles S. T. Burke, one of the best of American comedians, appeared in 1836. In the same year, Misses E. and J. Anderson, granddaughters of the first Joseph Jefferson, made a successful beginning. The first became successively Mrs. Thoman and Mrs. Saunders, and the other Mrs. Germon, mother of Effie, artists by birth. Nathaniel H. Bannister, a native of Delaware, started in 1813, and acquired considerable reputation, both as actor and dramatic author. Then came a mere boy, at the obscure National theater, one destined to be the foremost of American comedians—Joseph Jefferson, son of Joseph, grandson of the first Joseph, and half-brother of Charles Burke. These great artists illustrate the truth of hereditary transmission. About this time, James E. Murdoch, a Philadelphian, began to make his mark in tragedy. In 1836, appeared Miss Jean Margaret Davenport, an infant phenomenon. She became the wife of col. Frederick W. Lander, and during the war of the rebellion she was a devoted nurse in the hospitals of the union army. Charlotte Cushman, the greatest of American actresses, now threw the light of her powerful genius and individuality upon the stage. In 1838, Mary Cecilia Taylor ("our Mary") made her début, and became perhaps the most popular favorite ever known in New York city—a very clever and versatile though not a great actress. "The Shaws," as three talented sisters were called, were now coming prominently forward. They were Regina (first, Mrs. Charles Howard, and then Mrs. H. Watkins), Mary (first, Mrs. Fogg, and then Mrs. Krollman), and Josephine (first, Mrs. Russel, and then Mrs. John Hoey). All had more than ordinary talents, and were great favorites. Edward Eddy, b. in Troy, N. Y., appeared in 1839; a very heavy tragedian and melodramatic actor. In the same period came Joseph Proctor and his wife (Miss Hester Warren). John Gilbert first appeared in New York in 1839, and has ripened into the most accomplished "old man" on any stage. He was born in Boston in 1810, and made his début there in 1828.

Thus we struggled on with English plays and English players, except as above mentioned, until John Brougham, an Irishman, came over (in 1842) to stay. He was the first author to put life into the play-bills. Though not born here, his work was essentially American, especially those inimitable burlesques, *Pocahontas* and *Columbus*. He was also the best Irish and general comedian of the day. In June, 1844, a bright par-

ticular star appeared in the person of Anna Cora Mowatt, who was for several years the reigning favorite in genteel comedy and light tragedy. Only a few months before, Edward L. Davenport had made his mark, and he supported the rising actress in a successful tour. Davenport was an actor of great versatility, taking almost anything from "Hamlet" to "Bill Sykes." He was a native of Boston. Another welcome addition to the stage was Julia Dean, a native of New York, whose line was much like that of Mrs. Mowatt. John Lester Wallack (born here of English parents) made his first appearance in 1847. He is a worthy successor of his father, James W. Wallack, and a fit representative of a family that have shed luster upon the stage. In Dec., 1849, the "Bateman children" (Kate, aged 6, and Ellen, aged 4) appeared as dramatic prodigies. Ellen did not long remain on the stage, but Kate Josephine (Mrs. Crowe) became one of the foremost of American actresses, and had great success in England. In 1850, George L. Fox, low comedian, and afterwards pantomimist, began a successful career.

Besides the American artists already mentioned, we must name (with some repetitions) Joseph Jefferson (3d) the first in comedy and pathos, William Warren, Edwin Booth (first in tragedy, and who seems to have touched perfection in the illustration of his select Shakespearean characters), A. A. Addams, Lawrence Barrett, Mrs. D. P. Bowers, John McCullough, Frank S. Chanfrau, John S. Clarke, Edwin Adams, J. M. Field, Mary Gannon, Mrs. Barrett, Matilda Heron, George Jamison, Frank Mayo, John E. Owens, John T. Raymond, John R. Scott, Daniel E. Setchell, Mark Smith, Charlotte Thompson, William J. Florence, Maggie Mitchell; and many others might be added. America is much stronger in players than in plays. Even Payne's tragedy of *Brutus* is made up of foreign materials. Some of the play-writers who have been most prominent are William Dunlap, David Paul Brown, Robert M. Bird, Nathaniel H. Bannister, Robert T. Conrad, George H. Boker, Epes Sargent, Dr. J. S. Jones, and Dr. W. K. Northall. Mrs. Mowatt, the actress, wrote *Fashion* and *Armand*. J. Wilkins wrote *Civilization*, and has not since been heard from in authorship. Julia Ward Howe has written for the stage. Harriet Beecher Stowe is hardly a dramatist, but her powerfully dramatic story of *Uncle Tom's Cabin*, which needed little except cutting down to fit it for the stage, has had far greater popularity than any other drama ever produced in America. Nathaniel P. Willis wrote tragedies; George H. Boker has done the same. Among American writers in 1880 are Bartley Campbell and Bronson Howard. Dion Boucicault, though not an American citizen, has produced in this country plays which have had popularity. There is a vast accumulation of trash in the green-room, crudely patched up by players themselves, and by third-rate writers who make plays to order as a cordwainer makes shoes. There is much cheap translation and adaptation of French plays, which often remain quite unadapted to a true American taste. So long as English and French authors fill the popular demand, the American stage will depend largely upon foreign supply. Still, America is growing in intellectual independence; and, considering the fact that the people are in one sense English, and the nation too new to furnish home material for historical dramas, its progress thus far is at least moderately good. There is a peculiar class of dramas that are as redolent of the American soil as *Jack Sheppard* and *Oliver Twist* are of that of old England. Such are the sensational pictures of Indian and border life, full of powder and blood and bowie-knives and exciting situations, but utterly worthless in a literary or artistic view. As concerns artists, we have sent to the mother country men and women who fairly balance our obligation for the Keans and the lesser lights from time to time sent to us across the ocean.

DRAMATIC WORKS, COPYRIGHT IN. Dramatic and musical works enjoy a legislative protection peculiar to themselves. By 3 and 4 Will. IV. c. 15, it is provided that the author of any dramatic piece not printed or published by him or his assignee, shall have, as his property, the sole liberty of representing it, or causing it to be represented, at any place of dramatic entertainment; and the author of any published dramatic work shall have the same privilege during his life, or his assignee for 28 years from the date of publication. By 5 and 6 Vict. c. 45, s. 20, the provisions of the former statute are extended to musical compositions; and the term of copyright provided for other works (see COPYRIGHT) is applied to the liberty of representing dramatic pieces and musical compositions. The following section (21) reserves to the proprietors of dramatic works the remedies given them by 3 and 4 Will. IV. c. 15, s. 2. These are the power of exacting from every offender a sum not less than 40 shillings, or the full amount of the benefit or advantage arising from the representation, or a sum equivalent to the loss sustained by the plaintiff, "whichever shall be the greater damages." The action must be brought within a year. The provisions of the act extend to both sexes.

DRAMBURG, a t. in the province of Pomerania, Prussia; 53 m. e. of Stettin; pop. about 5,626. There are in the place a number of manufactories, a normal school, and a gymnasium.

DRAM'MEN, a seaport t. of Norway, in the province of Aggerhuus, on both sides of the river Drammen, which here discharges its waters through the Drammen fiord into the gulf of Christiania, about 24 m. s.w. of Christiania. D., which is built in a valley, is divided into three quarters—Bragenœs on the n. bank of the river, and Stromsoe and Tangen, on the s. united to the first-mentioned quarter by a handsome bridge. The

chief streets, which run along each side of the river, are mainly composed of warehouses. The manufactures of D. are leather, ropes, sailcloth, tobacco, spirits, and earthenware; but the chief industry is the export of timber. Pop. 1875, 18,838.

DRANESVILLE, a village in Halifax co., Va., about 20 m. n.w. of Washington. A battle was fought here, Dec. 20, 1861, between the unionists and the confederates. It was an artillery duel, important only as the first success gained by the union army of the Potomac.

DRAPER, JOHN WILLIAM, American chemist and physiologist, was b. near Liverpool, England, May 5, 1811, and educated at a Wesleyan school at Woodhouse Grove, and later pursued his studies in chemistry under Dr. Turner of the London university. In 1833, he joined some of his relations who had emigrated to America, and in 1836, took his degree of doctor of medicine in the university of Pennsylvania, and was appointed professor of natural philosophy, chemistry, and physiology in Hampden Sidney college, Virginia. In 1839, removing to the city of New York, he was connected with the preparatory department, and in 1841, joined Drs. Mott, Patterson, etc., in founding the medical college of New York university, in which he was at first professor of chemistry, and in 1850, of physiology. He is a clear and able lecturer, and a voluminous writer, having been a liberal contributor to the American *Journal of Medical Science* and the Edinburgh *Philosophical Journal*, and published a treatise on *The Forces which produce Organization in Plants* (4to, 1844); *Text-book of Chemistry* (12mo, 1846); *Text-book of Natural Philosophy* (8vo, 1847); *Human Physiology, Statical and Dynamical, or the Conditions and Course of Life in Man.* Dr. D. has also published *History of the Intellectual Development of Europe; Thoughts on the Future Policy of America* (1865); *Philosophical History of the Civil War in America* (1867–70); *History of the Conflict between Religion and Science* (1874).

DRA'PERY (Fr. *drap*, cloth), any kind of woolen cloths for dress, the dealers in which in England are known as drapers. In London, the drapers' company is one of the more wealthy civic corporations, with a hall and almshouses.

DRAPERY in art. From the very great difficulties with which the artist has to struggle in dealing with the arbitrary and ungraceful forms of modern dress (see COSTUME), we are often led to regard drapery as an impediment, in place of an aid and accessory, to the representation of the human form in plastic art. The erroneous nature of such a conception will be manifest at once to those who direct their attention to the study of drapery in antique art, with a view to discovering not so much how as why it was employed by a people whose national customs admitted of their almost wholly dispensing with it had they felt so disposed. Such a study will convice us that, when properly disposed, drapery tends, in many cases, to exhibit the form, to enhance the characteristics, and to intensify the attitude, whether in action or in repose. It tells, moreover, something of the circumstances in which the action takes place beyond what could possibly be told by the naked figure. The waving drapery of a hunting Diana, or an Apollo shooting with the bow, tells us at once that the action is taking place in the open air, with the fresh breezes of the Ægean blowing around them. On the other hand, that repose which is the peculiar characteristic of sovereignty, is indicated by the still and heavy character of the drapery which surrounds a Jupiter on Olympus, or a Cæsar on his throne. The simple rule—simple in principle, though by no means always easy in practice—for the disposal of drapery, seems to be that it shall never be employed without an object; and that every fold shall, so to speak, be a logical result, either of the form of the figure, of the circumstances in which it is placed, or of some previous fold to which the latter is subordinated.

DRAPIER LETTERS, written by Dean Swift over the signature "M. B. Drapier," in which he counseled the people of Ireland not to receive the money coined by William Wood, to whom the English government had granted a patent in 1722 to supply a deficiency in the coinage of that country, of more than $500,000. The letters made a great sensation in Ireland, and caused the patent to be canceled, but not until about $400,000 in half-pence had been coined. Popular feeling was so intense at the time, that Wood was forced to leave the country.

DRAUGHT or DRAFT OF WATER, in maritime affairs, is a technical name for the depth to which a ship sinks in the water when fairly afloat, The D. is marked on the stem or stern-post, or both, from the keel upwards. When a ship is in good trim, the D. does not differ much at the two ends. Ships with sharp bottoms draw more water, or have a "greater draught," than those of flatter construction. For D. as applied to plows, wagons, etc., see TRACTION.

DRAUGHTS, like chess, is a game played with "men" on a checkered board. As far as the *science* of the game is concerned, it falls far short of chess, but is nevertheless a favorite recreation with many classes of people. In France it is called *les dames*, from its having been a favorite game with ladies; and in Scotland the-draught-board is called the *dambrod*.

Two persons usually play this game, each having a set of twelve men—one set black, the other white. The men may be placed either on the black or white squares, but the

whole must be placed on one color only. Thus, in England, it is usual to play upon the white squares, with a black square to the lower right, and in Scotland upon the black, with a white square to the lower right. In chess, the men may be moved straight forward, sidewise, or diagonally, and over many squares at once; but in D., the men may be moved diagonally only, and by *one* square at a time. If an enemy's man stands in the way, no move may take place unless there be a vacant square beyond into which the piece can be lifted. The man leaped over is then taken and removed from the board. The grand object of the game is, therefore, to clear the board of the enemy's men, or to hem them in so that they cannot be moved, and whichever party does so first, wins the game. As no piece can move more than one step diagonally at a time, there can be no taking till the antagonists come to close quarters; and the advancing of them cautiously into each other's neighborhood is the chief art of the game. When a man on either side has made his way, either by taking or by a clear open path, to the opposite side of the board, he is entitled to be "crowned," which is done by placing another man on the top of him. Crowned men may move either backwards or forwards, but always diagonally and by one square at a time, as before; and this additional power thus gained gives a great advantage to the player who owns the greatest number of crowned heads, and usually decides the game in his favor.

DRAUGHTSMAN. A draughtsman differs from a designer inasmuch as he lays no claim, in that capacity at all events, to the character of an originator.

DRAVE (Ger. *Drau*), a river of Austria, rises in the e. of Tyrol, in lat. 46° 45′ n., and long. 12° 25′ e., flows n.e. through the Pusterthal towards Lienz, where it is joined by the Isel. It then flows e. through Carinthia, passes Villach, where it becomes navigable, after which it passes Marburg, receives the Dran from the right, and the Mur, its principal affluent, from the left; then turning towards the s.e., it forms the boundary between Croatia and Slavonia on the right, and Hungary on the left, and pours its waters into those of the Danube at a point 10 m. e. of Essek, the capital of Slavonia. The D. is nearly 450 m. long. In the first part of its course, it is a mountain torrent, rushing furiously through the mountain passes of Tyrol; but joined by numerous streams, its volume increases, and its course becomes more staid. The valleys through which it flows in its course through Carinthia, Styria, and Croatia, are distinguished by great fertility and picturesque scenery, while the population upon its banks is numerous and industrious. In Slavonia, the D. is frequently bordered by dense forests.

DRAWBACK, a term in commerce, employed in connection with the remitting or paying back of excise duties on certain classes of articles exported. Excise duties, as a matter of course, enhance by so much the natural price of the commodity on which they are imposed. Were these duties not remitted, the commodity so taxed would not be ordered from those foreign countries where articles of the same kind could be purchased free of such duties. To afford facility for the exportation of these articles, the state resorts to the expedient of returning to the exporter a sum equal in amount to what he or the manufacturer had paid to the excise. Such is drawback. Among other matters of fiscal policy, Adam Smith, in his *Wealth of Nations*, discusses the propriety of giving drawbacks, and sees in them nothing that is adverse to a sound political economy. "To allow," he says, "the merchant to draw back upon exportation, either the whole or a part of whatever excise or inland duty is imposed upon domestic industry, can never occasion the exportation of a greater quantity of goods than what would have been exported had no duty been imposed. Such encouragements do not tend to turn towards any particular employment a greater share of the capital of the country than what would go to that employment of its own accord, but only to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally establishes itself among all the various employments of the society, but to hinder it being overturned by the duty: they tend not to destroy, but to preserve, what it is in most cases advantageous to preserve, the natural division and distribution of labor in the society." Correct as is this view in general principle, it could perhaps be shown, by the closer experience of the present day, that the practice of giving drawbacks is liable to abuse; as, for example, when an excisable article falls in value, and it is exported in order to get the D., with little or no reference to sales abroad, or in the hope that the D. will at least bring the amount of the freight. So far, therefore, the state is made to foster an improper species of commerce. To prevent deceptions as far as is practicable, certain rules and formalities have to be attended to by exporters, to which we shall briefly refer.

In preparing goods for D., they must be packed in presence of an excise-officer, who sees them weighed, if the D. depends on weight. When the package is completed, he incloses it with a tape, which is properly fixed with a seal. Under this seal it is transferred to the port of shipment, and cleared for export by a person authorized by license from the officers of customs. In the case of press-packed goods, the quantities and qualities must be verified by the oath of the master-packer or his foreman. D. is given only on goods which have been charged with duties within three years, and no D. is given on damaged or decayed goods. It is payable only to the real owners of the articles shipped. It is not payable for a certain period after shipment and departure; but cannot be demanded later than two years after shipment. As a

verification of the principal particulars mentioned, the excise-officer concerned executes a certificate or debenture (q.v.), and under its operation the D. is paid by the inland revenue department.

DRAWBRIDGE. See BRIDGE.

DRAWER OF A BILL. See DRAFT, BILL.

DRAWING is the art of delineating form, as opposed to color and light and shade. The term is not confined to the first outline produced by the pencil or crayon, though this is a narrower sense in which it is also used, and what we commonly mean when we speak of a drawing. In its wider sense, D. is used to describe what is in reality the most important feature of a finished painting of Raphael or Correggio, as well as of an outline by Flaxman or Retch. D., in this sense, has been termed the grammar of art. But the analogy is incomplete; for the one quality which is requisite in the application of grammar, is correctness, whereas D., even when correct, even when faultless, admits of degrees of perfection. It may be more or less powerful, more or less free, more or less graceful; and indeed there is no characteristic in which the great artists of the Italian and Flemish schools more unmistakably excell all their successors, than in the power and beauty of their drawing. Neither is there any feature which more unmistakably stamps the individuality of the artist upon the picture.

DRAWING-BOARD, a board on which drawing-paper is strained for painting on in water-colors. The paper is wetted for the purpose of being strained, and, when attached at the edges, it is permittted to dry and contract. Formerly, the drawing-board was fitted into a frame, the edges of the wet paper being made fast by the pressure of the frame on the board. But the much simpler drawing-board which is now in use is made of a flat piece or pieces of wood, held together, and prevented from warping, by an edging of other pieces, the grain of which runs in the opposite direction. The wet paper is attached to the edges of the board with paste or thin glue, and when dry, becomes perfectly firm and flat. When the work is finished, the paper is cut beyond the drawing with a knife.

DRAWING AND QUARTERING. The punishment for treason still is, that the offender be *drawn* to the place of execution on a hurdle (q.v.); that he be hanged by the neck till he be dead; that his head be severed from his body, and that body be divided into four parts, or *quartered.* The sovereign may, and now certainly would, by a warrant under the sign-manual, countersigned by a principal secretary of state, change the sentence into beheading. In the case of females, the quartering is dispensed with. Stephen's *Commentaries,* iv. 234. See TREASON.

DRAW-PLATE, a steel plate with a graduated series of holes, through which metals are drawn in making them into wires or bars.—Also a name given to a plate of metal placed before a fire or before the lateral opening between the top of the fireplace and the throat of the chimney. Its use is to force the air to pass through the fire on its way into the chimney, instead of allowing it to pass over the fire.

DRAYTON, MICHAEL, was b. in 1563 at Hartshill, in Warwickshire. Of the events of his life but little is known. He is supposed to have studied at the university of Cambridge, and to have been in the army when young. His earliest work, *The Shepherd's Garland,* was published in 1593. He afterwards published the *Barons' Wars; England's Heroical Epistles,* etc. The *Polyolbion,* the work by which he is best known, appeared in 1613. He was poet-laureate in 1626; he died in 1631, and was buried in Westminster abbey. As a poet, D. is but little known, save to readers like Charles Lamb, who delighted in the obscure corners of literature. His *Polyolbion* is a topographical poem; and passages from it, now and then met with in county histories and works of an antiquarian character, surprise the readers with their stately rhythm, their nervous force, and their felicity of diction. Vols. I., II., and III. of a complete edition of D.'s works, by the Rev. Richard Hooper, M.A., were published in 1876.

DRAYTON, WILLIAM HENRY, 1742–79; b. S. C.; educated at Oxford, England. In 1771, he was privy councilor of South Carolina; but when the revolution began, he espoused the popular cause, and became a member of the committee of safety. In 1775, he was president of the provincial congress, and the next year was elected chief-justice of South Carolina. He was a prominent member of the continental congress until his death. He left a minute narrative of the current events of the revolution.

DRAYTON-IN-HALES, or MARKET DRAYTON, a t. in the n.e. of Shropshire, on the Tern, 19 m. n.e. by n. of Shrewsbury. Pop. '71, 4,039, chiefly agricultural. There are manufactures of paper, and of hair-seats for chairs. The parish church was built in Stephen's reign, but quite altered by repairs in 1787. Here, in 1459, the Yorkists defeated the Lancastrians.

DREAMING. In complete sleep, there is probably an entire absence of consciousness of external things. Usually, however, there is a certain amount of mental activity, of which we are more or less conscious at the time, and of which we have more or less subsequent remembrance. This is the state known as dreaming. The chief feature of

this state is "an entire *absence of voluntary control* over the current of thought, so that the principle of *suggestion*—one thought calling up another, according to the laws of association—has unlimited operation." We seem to perform all the actions of life; we experience every kind of mental emotion, and sometimes our reasoning processes are remarkably clear and complete. Thus, when the mind, during sleep, takes up a train of thought on which it had been previously engaged during the preceding waking hours, intellectual efforts may be made during sleep which would be impossible in the waking state. Such cases, however, are not common. To name two instances (quoted by Dr. Carpenter in his essay on sleep in the *Cyclopædia of Anatomy and Physiology*): Condorcet saw, in his dreams, the final steps of a difficult calculation which had puzzled him during the day; and Condillac states that, when engaged with his *Cours d'Etude*, he frequently developed and finished a subject in his dreams which he had broken off before retiring to rest.

Occasionally, but by no means commonly, dreams seem to possess a remarkable coherence and congruity in reference to the reasoning processes, or the combinations of the imagination. Most of our readers are probably acquainted with the incident narrated by Coleridge of himself, that his fragment entitled *Kubla Khan* was composed during sleep, which had come upon him in his chair whilst reading the following words in Purchas' *Pilgrims:* "Here the khan Kubla commanded a palace to be built, and a stately garden thereunto; and thus ten miles of fertile ground were inclosed within a wall." Coleridge continued for about three hours apparently in a profound sleep, during which he had the most vivid impression that he had composed between 200 and 300 lines. The images, he says, "rose up before him as things, with a parallel production of the correspondent expressions, without any sensations or consciousness of effort." On awakening, he had so distinct a remembrance of the whole, that he seized his pen and wrote down the lines that are still preserved. Unfortunately, he was called away to attend to some business that lasted more than an hour, and on his return to his study, he found, to his intense mortification, that "though he still retained some vague and dim recollection of the general purport of the vision, yet, with the exception of some eight or ten scattered lines and images, all the rest had passed away like the images on the surface of a stream into which a stone had been cast." In other cases, a dream may leave a strong general impression on the mind, although particulars, even immediately on waking, cannot be recalled. Tartini is said to have composed the *Devil's Sonata* under the inspiration of a dream, in which the arch-fiend challenged him to a trial of skill. The dreamer lay entranced by the transcendent performance of his distinguished visitor; but on awakening and seizing his violin, although he was unable to reproduce the actual succession of notes, he produced from his general impressions the celebrated composition which we have named.

Generally, however, dreams are wanting in coherence; all probabilities, and even possibilities of "time, place, and circumstance" are violated. Friends long since dead appear and converse with us; and events long since past rise up before us with all the vividness of real existence. We may be conveyed to the antipodes, or even to worlds beyond our own, without the difficulty of the distance at all standing in the way. We are not aware of the grossest incongruities, probably because we are unable to test the probability of the phenomena by our ordinary experience; hence nothing that we see or do in a dream surprises us. Prof. Wheatstone observes, that "we may walk along the brink of a precipice, or see ourselves doomed to immediate destruction by the weapon of a foe, or the fury of a tempestuous sea, and yet not feel the slightest emotion of fear; though during the perfect activity of the brain we may be naturally disposed to the strong manifestation of this feeling. Again, we may see the most extraordinary object or event without surprise, perform the most ruthless crime without compunction, and see what in our waking-hours would cause us unmitigated grief, without the smallest feeling of sorrow;" and Cicero, who long previously had made D. his study, justly remarks (*De Divinatione*, 59), that if it had been so ordered by nature that we should actually do in sleep all that we dream, every man would have to be bound down on going to bed. Occasionally, however in place of this passive condition, the emotions may be highly excited; thus, for example, the sailor's wife is apt, especially in stormy weather, to dream of shipwreck, and to shriek with terror from its attendant miseries; and those who have once in their lives been exposed to some fearful danger, are apt to have the scene recalled to them in their dreams, either with all its appalling and life-like exactness, or possibly in a grotesque and impossible modification.

Although the predisposing causes of dreams may be sought for in more than one direction, they are probably in general referable to some peculiar condition of the body, and are often called into action through the agency of the external senses. Dr. Gregory relates, that having occasion to apply a bottle of hot water to his feet at bed-time, he dreamed that he was walking up Mt. Etna, and found the ground insufferably hot. Dr. Reid having had a blister applied to his head, dreamed that he was scalped by a party of Indians. M. Gizon de Buzereinges made a series of pre-arranged experiments, with the view of seeing how far he could determine at pleasure the character of his dreams. In his first experiment, having allowed the back of his head to be uncovered during sleep, he thought that he was at a religious ceremony in the open air; the custom of the country in which he lived being to keep the head covered, except on some rare occur-

rences, among which was the performance of religious ceremonies. On waking, he felt cold at the back of the neck, as he frequently had felt when present at the real ceremonies. He repeated the exepriment in two days with the same result. In a third experiment, he left his knees uncovered, and dreamed that he was traveling at night in the diligence; and all travelers know, he observes, that it is chiefly at the knees that they feel cold when traveling by that conveyance at night.

One of the most remarkable phenomena of D., is the rapidity with which long trains of thought pass through the mind. A dream requiring hours for its accomplishment, is begun and terminated in a few seconds. A person who was suddenly aroused from sleep by a few drops of water sprinkled in his face, dreamed of the events of an entire life in which happiness and sorrow were mingled, and which finally terminated with an altercation upon the borders of an extensive lake, in which his exasperated companion, after a considerable struggle, succeeded in plunging him. Dr. Abercrombie relates a similar case of a gentleman, who dreamed that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and at last led out for execution. After all the usual preparations, a gun was fired; he awoke with the report, and found that a noise in an adjoining room had both produced the dream and aroused him from sleep. Dr. Carpenter mentions the case of a clergyman falling asleep in his pulpit during the singing of the psalm before the sermon, and awakening with the conviction that he must have slept for at least an hour, and that the congregation must have been waiting for him; but on referring to his psalm-book, he was consoled by finding that his slumber had lasted not longer than during the singing of a single line. Sir Benjamin Brodie, in his *Psychological Inquiries* (1854), mentions the following anecdote of the late lord Holland: "On an occasion when he was much fatigued, while listening to a friend who was reading aloud, he fell asleep and had a dream, the particulars of which it would have occupied him a quarter of an hour or longer to express in writing. After he woke, he found that he remembered the beginning of one sentence, while he actually heard the latter part of the sentence immediately following it, so that probably the whole time during which he had slept, did not occupy more than a few seconds." Many facts of the same kind are on record, and as the author from whom we have quoted, remarks, "if were to pursue this subject, it would lead us to some curious speculations as to our estimate of time, and the difference between the real and the apparent duration of life." It is from cases of this nature that lord Brougham has been led to the opinion, that *all* our dreams really take place in the act of falling asleep or of awaking. We cannot, however, explicitly accept this doctrine. 1. There is no sufficient proof of its being true. 2. We have a proof to the contrary in the fact, that it is common for people to moan and even talk in the middle of a sleep; and every one who has kept a dog must frequently have observed him dreaming (from the outward manifestations which he makes in the form of snarling or growling), though he still remains asleep. Some, on the other hand, have argued that the mind can never be entirely inactive, and that every one is dreaming throughout the whole period of sleep, although the dreams may not be remembered in the waking state. We know of no facts that can be adduced in favor of this hypothesis, and the following case goes strongly to disprove it: A woman, aged 26, who had lost a portion of the scalp, skull, and dura mater, so that a portion of her brain was exposed to view, was a patient in 1821 in the hospital at Montpellier. When she was in a dreamless state, or in profound sleep, her brain was comparatively motionless, and lay completely within its bony case; but when the sleep was imperfect, and the mind was agitated by dreams, her brain moved and protruded from the skull, forming what is termed cerebral hernia. This protrusion was greatest when the dreams, as she reported, were most vivid; and when she was perfectly awake, especially if actively engaged in conversation, it attained its highest development, nor did this protrusion occur in jerks, alternating with recessions, as if caused by arterial action, but remained permanent while the conversation continued. If the *data* of this case are to be depended on, the appearance of the brain during profound sleep seems to indicate that during that state there is a total or nearly total suspension of the mental faculties.

The author of *Psychological Inquiries* suggests the question: Do dreams answer any purpose in the economy of living beings? We regret that he has not given us a very definite answer, but he obviously inclines to the view that they cannot be purposeless. No one has hitherto offered any certain explanation of the uses of the spleen, of the thyroid gland, or of the supra-renal capsules; yet no one believes the formation of these organs to be merely incidental, or doubts that they have some special (although at present unknown) function to perform. "Dreams are," he observes, "at any rate, an exercise of the imagination. We may well conceive that one effect of them may be to increase the activity of that faculty during our waking-hours, and it would be presumptuous to deny that they may not answer some purpose beyond this in the economy of percipient and thinking beings."

Dreams have, in all ages and countries, been believed in as indications of the future; and of all forms of superstition, this is perhaps the most excusable. Whatever is mysterious as to its cause, and beyond the power of the will, appears as supernatural; and what more so than dreams! The thoughts in dreams, too, arise out of the past and present circumstances of the dreamer, and therefore are not altogether without connec-

tion with his future destiny, as most other omens are. In the Homeric age, it was firmly held that "dreams come from Zeus." In the most ancient civilized communities of which we have any record—those of Egypt and Babylon—to interpret the monarch's dreams was one of the most important state offices, and was confided to a college of wise men. A common way of consulting the Greek and Roman oracles (q.v.), was for the inquirer to sleep a night in the temple, after performing sacrificial and other rites, when his questions were supposed to be answered in dreams. Grave philosophers wrote treatises on the interpretation of dreams, as they did on astrology. Even Bacon, although he confesses that the interpretation of dreams is mixed with numerous extravagances, yet speaks as if he thought that something might be made of it. In modern times, and among European nations, dreams are seldom heeded except by the very ignorant or superstitious; and "as idle as a dream" has become a proverb. Nothing can be conceived more arbitrary than the pretended rules of interpretation—e.g., "that to dream of gold is good luck, but of silver, ill." See Brand's *Popular Antiquities*, by Ellis, where a "Dictionary of Dreams" is given. As to the actual coincidences that sometimes happen between dreams and events, it is only surprising, considering the countless fancies that are passing through our minds while asleep, that the coincidences are not ten times more numerous than they are.

DREBBEL, CORNELIS VAN, 1572–1634; a Dutch inventor of whose life little is known. He seems to have been a favorite at court, and tutor to the son of Ferdinand II. In the thirty years' war he was arrested and saved from execution only through interference of James I. of England. After 1620, he resided in London, where, it is said, he invented the compound microscope and an air thermometer with its bulb filled with water. It was reported also that he showed the king a glass globe in which, by means of the four elements, he had produced perpetual motion; and that by means of other machinery he imitated lightning, thunder, rain, and cold, and was able to speedily exhaust a river or lake. He made some discoveries in dyes, which were used by the founders of the Gobelin manufactures.

DREDGE, a machine for dragging or dredging the bottom of seas, rivers, or lakes, in order to bring up oysters and other animals that lie on the bottom. The common oyster-dredge is a bag-net, made of iron rings, linked together to form the meshes; the mouth is made of sheet-iron, which acts as a scoop when the dredge is let down and drawn along the bottom as the boat sails on. The dredge has of late been very extensively used by the naturalist with very important results, among the most remarkable of which are those obtained by the *Challenger* expedition, showing the existence of animal life in great variety at depths where it had before been considered impossible. The ordinary naturalist's dredge is of a lighter construction than that of the oyster fisher, and its meshes should be smaller. For dredging a sandy bottom, the best form of dredge is one like the net used by the Kentish shrimpers. These are twine nets, bag-shaped, and of the length of the boat. The lower side of the mouth of the net is stretched upon a wooden pole, and the other side is held up while the lower is drawn along the bottom. The quantity and variety of animals drawn up by these nets are astonishing. The dredge used for soles resembles the shrimp-net; but all dredges must be modified to suit the bottom on which they are used.

DREDGE (*ante*). Naturalists use an instrument constructed on the general plan of an oyster-dredge for obtaining specimens of animals living at the bottom of the sea, to determine their structure and geographical distribution. In working, the dredge is slipped gently over the side of the boat, either from the bow or the stern. When it reaches the bottom and begins to scrape, an experienced hand upon the rope can usually detect by the tremor of the line when the dredge is passing over an irregular surface. The boat should move not more than a mile in an hour. The dredge may remain down from 15 to 20 minutes, within which time, in favorable circumstances, it may be fairly filled. It comes up variously freighted, according to the locality, and the contents are examined. The scientific value of dredging depends mainly upon two things: the care with which objects procured are preserved and labeled for future identification, and the accuracy with which all the circumstances of the dredging—the position, the depth, the nature of the ground, the date, temperature, etc.—are recorded.

Until the middle of the 18th c. the little that was known of the inhabitants of the sea beyond low-water mark seems to have been gathered almost entirely from objects thrown on the beach after storms, and from the chance captures of fishermen. The dredge was used to aid natural history, first by Otto Frederick Müller, in the researches which furnished material for his *Descriptions and History of the rarer and less known Animals of Denmark and Norway*, 1779. Thenceforward much advance was made in knowledge of deep-sea life, mainly by the efforts of the British association; but the first important undertaking was in the winter of 1872. At that time *The Challenger*, a steam-corvette of 2,306 tons, and 1234 horse-power, was sent out to investigate the physical and biological conditions of the great ocean basins. This vessel was thoroughly equipped, and carried a corps of distinguished scientists. Dredging was done from the main yard-arm. A strong pendant was attached by a hook to the cap of the main-mast, and, by a tackle to the yard-arm, a compound arrangement of 55 to 70 of Hodge's patent accumulators was hung to the pendant, and beneath it a block through

which the dredging-rope passed. The donkey-engines for hauling in the dredging and sounding gear were placed at the foot of the main-mast on the port side. They consisted of a pair of direct-acting high-pressure horizontal engines, in combination of 18-horse power nominal. Instead of a connecting rod to each, a guide was fixed to the end of the piston-rod, with a brass block working up and down the slot of the guide. The crank axles ran through the center of the blocks, and the movable block, obtaining a backward and forward motion from the piston-rod, acting on the crank as a connecting rod would do. This style of engine is commonly used for pumping, the pump-rods being attached to the guide on the opposite side from the piston-rod. At one end of the crank a small-toothed wheel was attached, which drove one thrice the multiple on a horizontal shaft extending nearly across the deck, and about 3 ft. and 6 in. above it. At each end of this shaft a large and small drum were fixed, the larger having three sheaves cast upon it of different sizes; the small being a common barrel only. To these drums the line was led, two or three turns being taken round the drum selected. In hauling in, the dredging-rope was taken to a gin-block secured to a spar on the forecastle, then aft to the drum of the donkey-engine on the port side, then to a leading-block on the port side of the quarter-deck, and across the deck to a leading-block on the starboard side corresponding in diameter with the drum used on the port side, and from this it was finally taken by the hands and coiled. The strain is of course greatest at the yard-arm and the first leading-block, and by this arrangement it is gradually diminished as the line passes round the series of blocks and sheaves. A change made latterly in the handing of the dredge had certain advantages. Instead of attaching the weights directly to the dredge-rope, and sending them down with the dredge, a "toggle," a small spindle-shaped piece of hard wood, was attached transversely to a rope at the required distance, 200 to 300 fathoms in advance of the dredge. A "messenger," consisting of a figure of eight of rope, with two large thimbles in the loops, had one of its thimbles slipped over the chain before the dredge was hung, and the other thimble made fast to a lizard. When the dredge was well down and had taken its direction from the drift of the ship, the weights, usually six 28-lb. deep-sea leads in three canvas covers, were attached to the other thimble of the traveler, which was then cut adrift from the lizard and allowed to spin down the line until it was brought up by the toggle. By this plan the dredge took a somewhat longer time to go down; but after it was adopted not a single case occurred of the fouling of the dredge in the dredge-rope, a misadventure which had occurred more than once before, and which was attributed to the weights getting ahead of the dredge in going down, and pulling it down upon them entangled in the double part of the line.

The great risk in dredging in very deep water is that of the dredge running down nearly vertically and sinking at once into the soft mud, and remaining imbedded until hauling in commences. During the earlier part of the voyage of the *Challenger* this accident frequently defeated, at least partially, the object of the operation; and, after various suggestions for modifying the dredge, it was proposed to try some form of the trawl in order to insure, so far as possible, the capture of any of the larger marine animals which might be present, and thus to gain a better general idea of the nature of the fauna. A 15-ft. beam-trawl was sent down off cape St. Vincent to a depth of 600 fathoms; the experiment looked hazardous, but the trawl duly came up, and contained, with many of the larger invertebrata, several fishes. The trawl seemed to answer so well that it was tried again a little further s. in 1090 fathoms, and again it was perfectly successful; and during the remainder of the voyage it was employed almost as frequently, and in nearly as deep water (3,125 fathoms in the Pacific), as Ball's dredge was in the Atlantic, where the deepest haul was at 3,150 fathoms. During the voyage of the *Challenger*, a course of about 70,000 nautical miles was traversed in three years and a half, and 362 observing stations were established at intervals as nearly uniform as circumstances would permit; and at the greater number of these, dredging or some modification of the process was successfully performed—52 times at a depth greater than 2,000 fathoms, and thrice at depths beyond 3,000 fathoms. So fully convinced were the *Challenger* officers that they could dredge at any depth, that it was only want of time and daylight which prevented their doing so at their deepest sounding, 4,575 fathoms. The Atlantic was crossed five times, and an erratic route through the Pacific gave a good idea of the conditions of the abysses of that ocean, while in the s. Indian ocean dredging and trawling were carried down close to the Antarctic ice-barrier.

The results of this expedition were of the most interesting nature. Animal life was found to exist at all depths, although probably in diminishing abundance as the depth becomes extreme; and in various parts of the world at depths beyond 400 or 500 fathoms the fauna had much the same general character. The species usually differed in widely separated areas, but the great majority of forms, if not identical, were so nearly allied that they might be regarded as representative and genetically related. Although all marine invertebrate classes were represented, echinoderms in their different orders, sponges and *crustacea* preponderated, while corals and *mollusca* were comparatively scarce. In the two groups first named, many forms occurred allied to families which had been previously regarded as extinct or nearly so; thus among the echinoderms, stalked crinoids were by no means rare, and many species of regular *echinidea* related to the chalk genus *echinothuria*, and many irregular species allied to *ananchytes* and *dysaster*,

occurred. The sponges were mainly represented by the *hexactinellidæ*, the beautiful order to which the glass-rope sponge of Japan and the marvelous "Venus's flower-basket" of the Philippines belong, the order to which the ventriculites of the chalk must also be referred.

Dredging at its greatest depth is a difficult and critical operation, and although by its means some idea of the nature and distribution of the abyssal fauna of the ocean has already been attained, it will be long before the blanks are filled up; for of the area of 140,000,000 sq.m. forming the "abyssal province," the actual amount hitherto traversed by the naturalist's dredge may still be readily reckoned by the square yard. [The substance of this article is from *Encyclopædia Britannica*, ninth edition.]

DREDGING-MACHINE, a machine used for clearing out or deepening the channels of rivers, harbors, etc. Dredging-machines are variously constructed, the simplest being like the oyster-dredge described above, only having a perforated cowhide bag instead of the chain-net, and a stronger "spoon" or iron mouth to the bag. This is attached to the end of a pole, and worked with tackle by men from a barge in such a manner that the loose matter of the bottom is scooped up into the barge. The bucket dredging-machine is much more efficient. It consists of a long stage or framework overhanging the side of the barge. This frame has a wheel at each end, upon which works a powerful endless chain, to which is attached a series of perforated iron buckets, each with a shovel-shaped steel mouth projecting considerably on one side. The overhanging framework forms an inclined plane, along which the buckets run, descending on one side, and ascending on the other. They are so arranged that they descend empty, and on reaching the bottom, the projecting shovel or scoop-mouth digs into the bottom, and partially fills the bucket with the silt; it then turns round on the wheel at the lower end of the incline, and runs up it till near the top, when it turns over the upper end, and in doing so its contents are emptied into a second attendant barge. This action is continued by every succeeding bucket of the endless chain. The perforations are for the passage of the water. By varying the inclination of the framework, the working depth may be increased or diminished. Some dredgers are fitted with two complete sets of buckets, one on each side of the vessel. A steam-engine and boiler, suitably placed in the dredger, are provided for giving motion to the machinery, and sometimes also to a screw-propeller placed at the stern. Perhaps nowhere has river-dredging been carried such a length as in the case of the Clyde, which, by this process of scooping, has at and below Glasgow been converted from a river navigable only for small vessels into an estuary capable of bearing the largest ships. The dredgers employed for this purpose are moved by steam, the materials scooped out being carried out to sea by lighters. These have a large open tank amidships, while the two ends are decked over, and afford such accommodation for crew or machinery as may be necessary. The sides of the hold are hinged from the top, and open outwards, and thus its contents can easily be emptied into the sea.

DRED SCOTT CASE. This was a case brought for final decision before the supreme court of the United States in 1856, which excited much interest in America as well as in Europe. The plaintiff was a negro named Dred Scott, who, with his wife and two children, had been held as slaves by a Dr. Emerson, in the state of Missouri. After the death of Emerson, Dred Scott with his family claimed to be free, on the ground that they had resided for some time with their late proprietor in a free territory—so that having, as Scott alleged, been free in that territory, they could not now be held to slavery. The result of the litigation was, that Dred Scott and his family did not become free by having been taken to a free territory, and were accordingly still held to be slaves.

DREIS'SENA, a genus of lamellibranchiate mollusks, generally regarded as belonging to the mussel family (*mytilidæ*), although, whilst the shell very much resembles that of the true mussels, the animal differs in having the mantle closed except at the anal and branchial slits, and a small aperture through which the foot and byssus protrude.—*D. polymorpha* is an interesting mollusk, because, having of late been accidentally introduced into British estuaries and canals, it has fully established itself, and is now abundant in many of them, and in the rivers with which they are connected. Originally, it is believed, a native of the rivers which flow into the Caspian sea and lake Aral, it has extended to the canals and rivers of Germany, Holland, etc. It is capable of living a long time out of water with its valves closed, and it is supposed that it may have come to Britain on timber imported from the continent.

DRELINCOURT, CHARLES, 1595–1669; a French Calvinistic minister at Langres, 1618. In 1620, he went to Paris, and was made minister of the church at Charenton. He wrote a large number of devotional works, which had a wide circulation. His *Catechism*, and *Consolations against the Fear of Death*, became well known in England. His controversial works were also numerous, and did much to consolidate the Protestant party of France. A number of his sons were distinguished as theologians or physicians.

DRENTHÉ, a frontier province of the Netherlands, is bounded on the e. by Hanover, on the n. and e. by Groningen, on the w. by Friesland, and on the w. and s. by Overyssel, in lat. 52° 37′ to 53° 28′ n., and long. 6° 12′ to7° 10′ east. Area, 1024 sq. miles. Pop. '75, 112,221. The soil is in general poor, only about one half of the surface

being capable of cultivation, the remaining portion covered chiefly with heath and morass. The principal crops are rye and buckwheat, but barley and oats are also raised. The inhabitants are chiefly employed in agriculture, pasturage—the cattle reared in D. being famous—and in digging and exporting peat. Two pauper colonies in the w. of the province, the Fredericksoord and Willemsoord, established in 1818, are employed by the state in bringing waste land under cultivation, and in brick-making, weaving, and other occupations.

DRESDEN, the capital of the kingdom of Saxony, situated in a charming valley on both sides of the Elbe, in lat. 51° 3′ 16″ n., and long. 13° 44′ east. It is 116 m. e. of Berlin, and 72 m. e.s.e of Leipsic. It is composed of the Altstadt (Old Town), on the left bank of the Elbe; and of the Neustadt (New Town), on the right or northern bank. D. is a pleasant, though not exactly a beautiful town. It contains several open squares both in Old and the New towns. Pop. '75, 197,295. On account of its architecture and splendid collections in art, it has been justly called the "German Florence." Of the churches, the finest are the Frauenkirche, with a tower 335 ft. in height; the Roman Catholic church (1737–56), with a celebrated organ by Silbermann, and numerous statues and pictures; the Sophienkirche; and the Kreuzkirche, with an altar-piece by Schönau. The synagogue of the Jews, built in the oriental style by Semper, is also worthy of mention. Among the other important buildings may be mentioned the royal palace, a shapeless edifice, begun by duke George, 1534, and completed by Augustus II.; the prince's palace, erected by Augustus II. in 1718; the zwinger, only the vestibule of a palace in the almost too elaborate old French style of architecture, but containing many valuable antiquarian and scientific collections; the theater, the academy, the Brühl palace, etc. The Old and New towns are connected by two bridges, both *chefs-d'œuvre* of architecture.

D. possesses many excellent educational and charitable institutions. The academy of art opened in 1764, to which a school of architecture was added in 1819. This celebrated institution and the musical choir render D. of no small importance to the progress of art in the present day.

The most important branches of industry are gold and silver manufactures, machinery, straw-plait, paper-hangings, excellent painters' canvas, colors, artificial flowers, chocolate, porcelain, etc. An impulse was given to the corn-trade by the opening of the corn exchange in 1850.—The environs of D. are delightful.

The most important of the D. collections are: 1. The royal public library in the Japan palace, amounting to nearly 350,000 volumes. It contains many curiosities, and is particularly complete in the departments of literary history and classical antiquity, as well as in histories of France and Germany. 2. The cabinet of coins, likewise in the Japan palace. 3. The museum of natural history in the Zwinger, particularly complete in the mineralogical department. 4. The historical museum, formed in 1833. 5. The collection of mathematical and physical instruments, likewise in the Zwinger. 6. The renowned picture-gallery, containing upwards of 1500 paintings, mainly by Italian and Flemish masters. Among the former, those especially worthy of notice are the pictures of Raphael ("The Sistine Madonna"); of Correggio ("La Notte," and the "Madonna of St. Sebastian"); of Titian ("The Tribute-money," and "The Venus"); of Andrea del Sarto ("Abraham's Sacrifice"); of Francia; of Paul Veronese; of Giulio Romano ("The Virgin with the Pitcher"); of Leonardo da Vinci ("Francesco Sforza"); of Garofalo, Bellino, Pietro Perugino, Annibale Caracci, Guido Reni, Carlo Dolci, Cignani, etc. Of the Flemish school, the collection boasts 41 pictures by Rubens, 21 by Vandyck, many by Rembrandt, admirable specimens of Snyders, Johann Breughel, Ruysdael, Wouvermann, Gerard Dow, Teniers, etc. Of works of the German school, the gem of the collection is Hans Holbein's Madonna. Of the French school, several pictures by Nicolas Poussin, and some admirable landscapes by Claude Lorraine, are the most remarkable. 7. The cabinet of engravings in the Zwinger is arranged in twelve classes, marking distinct periods in the history of art. 8. The collection of antiques in the Japan palace, including several admirable sculptures. 9. The "green vault" in the royal palace, a valuable collection of precious stones, pearls, and articles wrought in gold, silver, and ivory. 10. The collection of porcelain in the Japan palace.

D. is known in history as far back as the year 1206. It is officially mentioned as a town in 1216. Henry the illustrious selected it for his capital in 1270. From the close of the 15th c., its prosperity gradually increased. Several successive sovereigns contributed to its embellishment, particularly Augustus I. and Augustus II. It suffered severely, however, during the seven years' war; and again in 1813, when Napoleon selected it as the central point of his operations. During the revolution of 1849, also, immense damage was inflicted upon the town, but it is again rapidly improving. D. was occupied by the Prussians in 1866 during the Austro-Prussian war. Since that year the city has been enlarged and made more delightful. New streets have been opened; old irregular buildings have given way to handsome and imposing edifices. The foundation stone of the magnificent new Court theater was laid in 1871.

DRESDEN, Battle of. In Aug., 1813, when the war between Napoleon and the allies, after a short truce, broke out afresh, the armies of the latter gathered from all sides towards Dresden, which they regarded as the key of the French position. It was

held by St. Cyr with a force of about 30,000 men, the main body of the French under Napoleon being in Silesia, where the emperor expected the contest was to be waged. On the 23d, the grand army of the allies appeared before Dresden. The town would in all probability have been quickly stormed, had not Schwarzenberg and the Austrians insisted on waiting the arrival of the left wing under Klenau. This delay saved the French, for at half-past 9, on the morning of the 26th, Napoleon with his guards entered the town. At 4 o'clock in the afternoon, Schwarzenberg, the commander-in-chief of the allies, gave orders for the attack. At various points, the assault was irresistible, but the opportune arrival of the "young guard" enabled Napoleon to hazard a sally, which was as unexpected as it was successful. The allies fell back everywhere; but not dispirited, renewed the fight next day. Towards noon, Moreau was mortally wounded by a cannon-ball at Alexander's side on the height of Räcknitz, and Napoleon obtained a decided advantage over the left wing of the allied army, which Murat, by a skillful maneuver, contrived to outflank, taking 10,000 prisoners, among whom was gen. Metsko. Several other successes in other parts of the field determined the allied armies, especially after hearing that Vandamme was advancing towards Pirne, to retreat, which they did during the night of the 27th Aug. Dresden, however, was not yet delivered from the miseries of war. When Napoleon finally quitted the city on the 7th Oct., nearly 30,000 men still remained behind. As all access was cut off by the Russians, the city suffered severely from famine. A capitulation was at length brought about (11th Nov., 1813) between St. Cyr and Klenau, according to which the garrison were to withdraw unmolested from the 12th to the 16th Nov., on condition that they laid down their arms. The capitulation was nevertheless rejected by prince Schwarzenberg, the garrison declared prisoners of war, and treated as such. The battle of Dresden, as Alison observes, was the *last* pitched battle, on a scale commensurate with his former victories, that Napoleon ever gained.

DRESS, the collective name for the artificial coverings worn in greater or less quantity by all but the most savage of the human race, and always combining the two objects of warmth and ornament. It seems, indeed, from what we read of savage nations, that it is rather in the desire for ornament that the wearing of dress begins, than with a view to protection from cold (see FASHION, under which head some notice will be given of the more singular caprices to which the forms of dress have been subjected; see also CRINOLINE, BLOOMERISM). The earliest coverings would consist of such articles as the skins of animals, and the leaves and inner bark of plants, which, as civilization advances, are mostly supplanted by various textures of wool, flax, silk, and other vegetable and animal substances. Some account of these textures is given under the appropriate heads, and the regulation of dress with a view to health is treated under HEALTH. As will be shown more fully under FASHION, the tendency in modes of dress—notwithstanding occasional aberrations—is towards simplicity and appropriateness.

DRESSINGS, in architecture, is a term loosely used to signify moldings and all the simpler kinds of sculptured decorations.

DREUX, an ancient t. of France, in the department of Eure-et-Loir, is situated on the river Blaise, 23 m. n.n.w. of Chartres, and 45 m. w. of Paris. It is tolerably well built, and lies at the foot of a hill crowned with the dilapidated ruins of an ancient castle, formerly the possession of the comtes de Dreux. From among the ruins rises a beautiful chapel, in the form of a Greek temple, surmounted by a cupola, erected by Louis Philippe. It contains the tombs of two of the children of Louis Philippe, and of others of his relations. The town-hall and the parish church, both handsome specimens of Gothic, are the only other buildings worthy of note. D. has extensive manufactures of coarse cloth, serge, etc., with a trade in sheep and cattle, also various tan-yards, iron-foundries, and dye-houses. Pop. '76, 7,087. In 1562, one of the bloodiest battles recorded in the religious wars of France took place at D., in which the Catholics, under the constable Montmorency, defeated the Huguenots, and took their leader the prince of Condé prisoner.

DREW, a co. in n.e. Arkansas, on Bartholomew bayou, and the head waters of Saline river; area recently diminished to form another co.; pop. '70, 9,960—3,854 colored. It is level and fertile, much of it covered with cypress and ash forests. Productions: corn, cotton, etc. Co. seat, Monticello.

DREW, DANIEL, 1797–1879; b. N. Y. He began life as a drover and dealer in cattle; soon went into the steamboat business, and afterwards into railroads, and became known as one of the boldest and sharpest of speculators in stocks, winning and losing several fortunes. He was always interested in the prosperity of the Methodist Episcopal church, and in proof of that interest founded the Drew Ladies' seminary, at Carmel, N. Y. (his native town), and the Drew theological seminary, at Madison, N. J. Not long before his death he lost his estate.

DREW, SAMUEL, 1765–1833; a native of Cornwall, England, in early life a shoemaker. He became a zealous Methodist, and in 1799, published some *Remarks* on Tom Payne's *Age of Reason*. This was followed by *Remarks on Payne; Essay on the Immateriality and Immortality of the Soul; Essay on the Identity and General Resurrection of the Human Body;* a *History of Cornwall;* and *An Attempt to Demonstrate from Reason and Revela-*

tion the Necessary Existence, Essential Perfections, and Superintending Providence of an Eternal Being, who is the Creator, the Supporter, and the Governor of all Things.

DREW THEOLOGICAL SEMINARY, for the education of Methodist ministers, was founded at Madison, N.J., in 1868, by Daniel Drew, a New York capitalist who gave an endowments of about $500,000. It was organized under the supervision of the Rev. Dr. John McClintock, its first president. The institution is handsomely located, and in 1878, had six professors, and 104 students. J. F. Hurst, D.D., was the president.

DREY'SE, JOHANN NIKOLAUS VON, 1787–1867; a native of Saxony, inventor of the needle-gun. He was the son of a locksmith, and followed the business, adding the manufacturing of tools. In 1836, he completed his invention of the needle-gun, which arm was a few years afterwards supplied to all the German troops He and his family were ennobled in 1864.

DRIFFIELD, GREAT, the chief town in the Wolds, in East Riding, Yorkshire, at the s. base of these hills, near one of the sources of the Hull, 28 m. e. by n. of York, and 20 m. n.n.w. of Hull. It lies in a fertile district, and consists chiefly of one long and broad street. It has a chemical work, flour, and bone-mills, and a considerable corn and cattle trade. Pop. '71, 5,067. Near D. many ancient tumuli have yielded human and horse skeletons, accouterments, flint spear-heads, urns, and a variety of ornaments.

DRIFT, in navigation, is a technical name for the deviation which a ship's course receives by the action of a contrary wind.

DRIFT, a name given to the boulder-clay, a deposit of the pleistocene epoch. More fully, it is called the northern drift, glacial drift, or diluvial drift, in allusion to its supposed origin. For an account of the formation, see BOULDER-CLAY.

DRIFT-WOOD is wood carried by tides and currents to a distance from its native locality. Specimens thus transported have been observed in the marine strata of the chalk, London clay, and other formations.

SAND-DRIFT is sand driven and accumulated by the wind. Deposits thus formed are occasionally found among the stratified rocks, but compared with other strata they are few, though, from their anomalous character, an acquaintance with their phenomena is of importance to the geologist. Moving sands are at the present day, in many places, altering the surface of the land. In the interior of great dry continents, as Africa, India, and Australia, extensive districts are covered with moving sands. The continuous blowing of a steady wind in one direction often covers a rich tract with this arid material. But the influence of the wind on loose sand is most evident along low sandy coasts, where hills, called "dunes," are formed entirely of it; they sometimes attain a considerable height, as much, for instance, as 200 or 300 feet. Dunes are advancing on the French coasts of the bay of Biscay at the rate of about 60 ft. per annum, covering houses and farms in their progress. Similar accumulations are forming on the coasts of Nairn, Cornwall, Wexford, and other parts of the British isles. The Culbin sands, in Nairnshire, cover a large district which at a period not very distant was rich arable land. The prevailing wind is from the w., hence the hills are slowly moving in an easterly direction, at the rate of a mile in somewhat less than a hundred years. A singular stratification exists in these hills. The prevailing w. wind lifts, or rather rolls the particles of sand up the gentle incline of the western aspect of the hill, until they reach the summit, where they fall, forming a steep declivity to the e., equal to the angle of repose for sand. A shower consolidates the surface of the new bed, or a land-breeze carrying the fine dust separates it by a very thin layer of finer material from the one that follows, and thus, as the hill moves eastward, a regular series of strata is formed at a very high angle. Little can be done to arrest the progress of these devastating sand-drifts. It has been recommended to plant *carex arenaria* and similar sand-loving plants, which have long creeping roots: they certainly check to a considerable extent the influence of the wind.

DRILL, *Cynocephalus leucophæus,* a species of baboon (q.v.), a native of Guinea, similar to the mandrill, but rather smaller and less ferocious.

DRILL is a general name for the exercises through which soldiers and sailors are passed, to qualify them for their duties. It is subject to numerous varieties, according to the number and organization of the men drilled at one time, and the kind of weapon to which the exercises relate. The infantry, the cavalry, and the artillery, all have different kinds of drill. The militia and the volunteers differ from the regulars, if not in the kind of D., at least in the circumstances under which it is carried on; the squad-drill, company-drill, and battalion-drill, vary both in the numbers concerned and in the routine of exercises. And so likewise in the navy, the drilling of seamen varies in kind, according to the duties likely to be required.

It is generally considered that four months' D. is required to fit an infantry recruit for service. The progress depends greatly on the intelligence of the men. It is on this ground that the rifle volunteers, enrolled in such large numbers in 1860, have been so advantageously placed; composed almost entirely of young men, whose intelligence has been developed by a moderately good education, the corps have advanced to a degree of proficiency which has attracted the marked attention of military officers.

Manuals of D. have been prepared for all the various branches of the two services. Drill-halls, in which D. can be carried on comfortably in any kind of weather, are now common.

DRILL, a fine linen fabric of a satiny finish, used for summer dress for gentlemen. Drills are worked with five shafts, except fancy patterns, which are wrought with eight shafts.

DRILLING-DRILL. Drilling is the name applied to the mode of sowing in regular rows, as distinguished from broadcast sowing, and the drill is the name of the implement employed in this process; the term *drill* is also frequently applied to a row of drilled crop, as a drill of potatoes, corn, or turnips. In all countries in which maize and Indian corn are grown, the principle of drilling has been long known and acted upon. In gardening it has been practiced everywhere from time immemorial; but its extension to field-culture is comparatively of recent date. Jethro Tull invented a drilling-machine in the early part of last century, and did much to show its merits in the culture of grain and root crops. Since his time, the use of this implement, in the case of both white and green crops, has in many districts become general. The crops which are now most generally drilled, are clover, flax, cereals, beans, pease, potatoes, turnips, beet-root, cole-seed, and carrots. Of these, clover and flax are sown in drills at about 3 or 4 in. apart; cereals from 6 to 12 in.; and beans, potatoes, and turnips at from 25 to 30 in. apart; the general rule, however, with most green crops, being that the space between the rows should admit of the passage of a light plow or hoe, drawn by a horse, without danger to the plants. A great variety of drills are now in use. The system of lifting the grain in small cups and conveying it to the coulters has been long in use. Garrett of Saxmundham, Suffolk, and Hornsby of Grantham, are favorite makers of corn and turnip drills. Latterly, R. Reid & Co. of Aberdeen have acquired fame with their patent disk corn-drill, which is popular in Scotland and some parts of England. One powerful recommendation of drilling is, that by means of it a considerable saving of seed is effected in the sowing of white crops; but the great advantage is, that in the case of green crops, it enables the farmer more readily to clean the land, both by the hand and by the horse hoe. About one-half the seed suffices when deposited by the drill-machine, compared with what the hand-sowing requires, and the seed is more regularly spread and better covered. The braird comes up more uniformly, and the straw is stronger and stiffer. Drill-sowing is slow work, but it is so efficient that it is gaining on the broad-cast. To keep the soil stirred and pulverized, which can only be properly done where the crops have been drilled, favors the retention and absorption of the moisture.

In England, turnips are sometimes drilled by a machine on the flat; while in Scotland, they are always sown on ridges or drills formed by the double-molded plow. The double-board or drill plow is to be found now on almost every farm, and its introduction has saved much labor. Turnip-sowing machines which take two drills at the time have been common for years, and potato-planters taking two rows at the stripe are being introduced, but have not been established yet. One of these was tried, with interest and success, at the Royal English Show, held at Hull, in 1873.

DRILLS are tools used for boring or drilling holes in metal, bone, ivory, hard woods, etc. They are usually made of a square steel bar, flattened out at the cutting end; this part is brought to an angular point like a spear-head, and the cutting edges forming the angle are beveled in opposite directions. Those which have a projecting pin in the center, and chisel-shaped cutting edges on each side of the pin, are called "center bits." There are various contrivances by which the drills are made to revolve. For drilling iron, steel, and large brass work, the lathe is commonly used, the drill being fitted into a square-hole chuck, and the work pressed against it while revolving by the screw and center of the puppet. The *brace* or *drill-stock* is commonly used by carpenters for center bits, and occasionally for metal work. This is a curved handle, which is made to revolve by the hand, while one end is pressed against the chest. Small drills for metal work are mounted with a *ferule* or pulley, or are fitted into a stock with such a pulley on it; a piece of cane or spring-steel is mounted with a string like an archer's bow, but loose enough to wind round the ferule. By drawing the bow lengthwise, the drill is made to revolve, and is at the same time pressed against the work by means of a *breast-plate*, which is held against the chest of the workman; this breast-plate has indentations upon it, which serve as sockets, into which the end of the drill-stock or drill works.

DRIMYS. See WINTER'S BARK.

DRINKING USAGES. Some of these are of great antiquity, and all are interesting in connection with the history of manners. Besides sacrifices of animals and articles of food, the Hebrews made drink-offerings a solemn religious service. To mark the spot where he communed with God, Jacob set up a pillar of stone, and "poured a drink-offering thereon."—Gen. xxxv. 14. We learn that such sacrifices were not made alone to the true God; for women are said to have poured out "drink-offerings unto other gods."—Jer. vii. 18. Such a statement is amply verified by pagan writers. Among the Greeks and Romans, the pouring out of a libation to the gods was a common religious observance. A libation was made on the occasion of solemn prayers, and also

before meals. These libations were usually of undiluted wine, but they were also sometimes of milk diluted with water, or water flavored with honey. There are many references to these libations by Sophocles, Æschylus, Pliny, and other writers. The libation at meals consisted of pouring a small quantity of liquor from the cup on the ground—so much waste being a kind of propitiation, or an act somewhat equivalent to the asking of a blessing. See SACRIFICE.

From these and similar usages in remote times sprung the ceremonial observance of drinking healths, or the uttering of a pious, heroic, or friendly sentiment before quaffing liquor on festive occasions. It has been stated that the practice of saying, or pledging "I pledge you," originated in England in the 10th c., it being then necessary for one to watch over the safety of his companion when the cup was at his lips. But the custom of drinking healths, as just mentioned, is of far higher antiquity, and was derived immediately from the boisterous convivialities of a Scandinavian and Teutonic ancestry (see VALHALLA), if not with equal likelihood from the usages of the early Britons, who were of Celtic origin. A story is told of a feast given by Hengist (5th c.) at his stronghold of Thong-caster, in Lincolnshire, to the British king Vortigern, and of the bewitchment of the royal guest by the charms of Rowena, the young and beautiful daughter of his entertainer. Rowena's address, as she gracefully knelt and presented the wine-cup to the king, *Liever kyning, wass heal*, or, "Dear king, your health," is often quoted as the origin of our still existing expressions, wassail and wassail-cup; though wassail means pledging or health-drinking independently of the saying of Rowena, and certainly was not then uttered for the first time. Wassail is derived from the old Anglo-Saxon *Wæs hæl*, "Be in health;" and *Wæs heil* and *Drinc heil* were the usual ancient phrases in quaffing among the English, and synonymous with "Here is to you," and "I'll pledge you," of later times. The explanation of wassail by an old writer, Robert de Brunne, may be appropriately quoted:

> "This is ther custom and her gest
> When thei are at the ale or fest,
> Ilk man that levis qware him think
> Salle say *Wosseille*, and to him drink.
> He that biddis salle say, *Wassaile*,
> The tother salle say again, *Drinkaille*.
> That says Wosseille drinkis of the cop,
> Kissand his felaw he gives it up."

The learned Selden, in a note on the *Polyolbion*, says: "I see a custom in some parts among us; I mean the yearly was-haile in the country on the vigil of the new year, which I conjecture was a usual ceremony among the Saxons before Hengist, as a note of health-wishing (and so perhaps you might make it wish-heil), which was exprest among other nations in that form of drinking to the health of their mistresses and friends. 'Bene vos, bene nos, bene te, bene me, bene nostram etiam Stephanium,' in Plautus, and infinite other testimonies of that nature in him, Martial, Ovid, Horace, and such more agreeing nearly with the fashion now used; we calling it a health, as they did also in direct terms." For further particulars concerning wassail and wassail-bowl, we may refer to Brand's *Popular Antiquities*, edited by Ellis. It is enough here to quote from that authority the following passages: "Milner on an ancient cup (*Archæologia*, xi. 420), informs us that 'the introduction of Christianity amongst our ancestors did not at all contribute to the abolition of the practice of wasselling. On the contrary, it began to assume a kind of religious aspect, and the wassel-bowl itself, which in the great monasteries was placed on the abbot's table, at the upper end of the refectory or eating-hall, to be circulated amongst the community at discretion, received the honorable appellation of "poculum charitatis." This, in our universities, is called the grace-cup.' The poculum charitatis is well translated by the toast-master of most of the public companies of the city of London by the words a 'loving cup.' After dinner, the master and wardens 'drink to their visitors, in a loving cup, and bid them all heartily welcome.' The cup [a silver flagon containing warm spiced wine] then circulates round the table, the person who pledges standing up whilst his neighbor drinks to him."

While the drinking of healths is thus of old date, the application of the word "toast" is modern, having had its origin in the practice of putting a piece of toasted bread in a jug of ale, hence called "a toast and tankard." The custom of so using the word is said to have had its rise at Bath, in the reign of Charles II. It happened that on a public day a celebrated beauty of those times was in the cross [or large public] bath, and one of the crowd of her admirers took a glass of the water in which the fair one stood, and drank her health to the company. There was in the place a gay fellow half-tipsy, who offered to jump in, and declared, though he liked not the liquor, he would have the toast. He was opposed in his resolution; yet this whim gave foundation to the present honor which is done to the lady we mention in our liquors, who has ever since been called a toast.—*Tatler*. Begun in the form of toasting beauties at private parties, toasts were in time given on all sorts of subjects at public festivities, accompanied with rounds of cheers and hurrahs, these noisy demonstrations being now called "the honors." The fatigue of announcing these exciting sentiments is so great, that in all well-ordered large assemblies a toast-master is employed. Standing behind the chairman, this official, besides proclaiming the toasts, acts as a fugleman to regu-

late the clapping of hands and the "hip, hip, hurrahs" of the company. "Toasts, certainly, in this guise look more like a medium for taking an indefinite quantity of wine, than that spontaneous effusion of the heart in honor of some cherished individual, which they originally were. On certain occasions, these signals are hushed, and the convivial glass is taken "in solemn silence." The effect is certainly rather startling. A convivial glass to the memory of one departed has surely something in it of practical absurdity."—Mrs. Stone's *Chronicles of Fashion* (1845). The absurdity of the whole toasting system has incurred the reprehension of temperance societies, without any perceptible abatement; but the old custom of drinking healths at private parties is now given up in good society, along with the excesses which were formerly practiced.

Space is not afforded in the present work to do more than glance at the diversity of D. U. in connection with domestic events and social intercourse. There were, as is well known, at one time drinkings on the occasion of births, baptisms, marriages, and even deaths; these last, which included the gloomy festivities of the *Lykwake*, or wake over the corpse of the deceased, being a relic of a very ancient custom, as was that, at least in Scotland, of drinking the *dredgy* (dirge) after the funeral solemnities were completed. In whatever manner these, as well as many other D. U., originated, it cannot be doubted that they were long maintained from the force of custom, along with that demand for artificial stimulus provoked by the naturally phlegmatic character of a northern people. For the long nights of a cheerless climate, there seems to have been sought the solacement of those intoxicating agents, in which it would have been fatal to indulge—where they were not needed—under the sunny skies of the south. We believe this is really the philosophy of the subject, if there be any philosophy in it; and it cannot fail to be observed, that just in proportion to an increase in the number of comfortable homes, the cultivation of mental resources, and the spread of a taste for harmless recreations, the more odious of the old convivialities disappear. Latterly, many amusing traditions respecting the drinking habits of a past age in Scotland, where they longest flourished without alteration, have been given in the *Memoirs of Lord Cockburn;* the *Autobiography of the Rev. Dr. Alexander Carlyle;* and the *Reminiscences of Scottish Life and Character*, by the Very Rev. Dean Ramsay (1860).

As regards miscellaneous drinking observances at one time common, we can refer but to a few of the more prominent. Perhaps the most offensive of all was that customary among tradesmen of imposing fines to be consumed in liquor. Apprentices, on being introduced to a workshop, paid so much entry-money to be spent in drink, and similar exactions were made from journeymen on entering a new employment. This was called paying their *footing*. When Benjamin Franklin, on his getting employment in a printing-office in London, refused to comply with this mischievous custom, he experienced, as he tells us, a variety of petty annoyances. Among shipwrights, the penalty of non-payment was flogging with a hand-saw from time to time, and other maltreatment. We refer to Dunlop's *Drinking Usages of Great Britain* (1839) for many curious details of this kind. Happily, the abolition of these usages has kept pace with the increasing intelligence of the working-classes, and of such outrages little is now heard. Prisoners, on being lodged in jail, as related in the novels of Smollett and others, were obliged to pay *garnish* for drink to the brotherhood of which they had become members. This pitiless exaction is now totally gone, through the efficacy of modern prison-discipline.

The giving of *vails* (Lat. *vale*, farewell) to servants on quitting a gentleman's house, which became so intolerable in the 18th c., as at length to be given up by universal consent, meant, doubtless, a gift to be spent in drink to the health of the donor, and was analogous to the custom of giving a *trink-geld* in Germany, and a *pour boire* in France, to servants, drivers of carriages, and others. There were, at one time, numerous drinking usages connected with departures. We need only notice the *bonaïlie* (Fr. *bon allez*), or, as it is sometimes called, a *foy* (Fr. *voie*), a festive drinking at the away-going of servants or of persons in a still higher degree, once common in the lowlands of Scotland; also the *stirrup-cup*, or, as it is called in the Highlands, *deoch an dorris*, or drink on getting on horseback, and being ready to set off.—For the moral and physical evils connected with D. U., and the means taken to redress them, we refer to the article TEMPERANCE. W. C.

DRIP, the projecting edge of a molding, so channeled as that the rain will drip from it instead of trickling down the wall.—*Parker*.

DRIPSTONE (Fr. *larmier*). The D. is a projecting molding or tablet placed over the head of a Gothic doorway or window, for the purpose of throwing off the water, whence it is also known as a water-table or weather-molding. Though such was, no doubt, its primitive use, the D. latterly became a mere ornamental appendage, which served to enrich and define the outline of the arch. It does not generally extend lower than the springing of the arch, though this rule is by no means without exceptions. When the tracery extends to a lower level, the external D. usually accompanies it, and Parker mentions that, at the n. doorway of Otham church, Kent, it descends the whole length of the jamb. The D. is not so constant a feature in continental as in English Gothic.

DRISLER, HENRY, LL.D., b. 1818; graduated at Columbia college, 1839, and was instructor in the grammar school there for several years; then teacher of Greek and Latin; in 1845, adjunct professor in the same department; in 1857, professor of Latin, and in 1867, of Greek. In the latter year, during president Barnard's absence in Europe, he was president *pro tem.* of the college. He afterwards for several years assisted prof. Anthon in editing his classical text-books. Besides many minor contributions to linguistic study, he has edited (1846) Liddell and Scott's translation of Passow's Greek Lexicon, and (1870) an enlargement of Yonge's English-Greek Lexicon.

DRIVER, on shipboard, is the name of a large sail occasionally set upon the mizzen-mast with a yard or gaff. A boom, called the *driver-boom*, extends the lower part of the sail a good way over the stern, like a cutter's mainsail.

DRIVING, FURIOUS. This, which was often an offense at common-law, is made a statutory offense by 24 and 25 Vict. c. 100, s. 35, so that if any person shall suffer any bodily harm, by reason of the wanton and furious driving or racing, or by the willful misconduct of any coachman, or other person having the charge of any carriage or vehicle in any place, the offender shall be guilty of a misdemeanor, punishable by two years' imprisonment. Special penalties were often put in general and local road acts; and 2 and 3 Will. IV. c. 120, by which the laws relating to stage carriages and horses let for hire were consolidated, enacts that any driver, conductor, or guard, guilty of furious driving, shall forfeit £5 (s. 48). The owners are liable for the penalty where the driver or guard is not known, or cannot be found. As to cabs, see HACKNEY-COACHMEN. Within the metroplis they are regulated by 1 and 2 Will. IV. c. 22, and other statutes, including 32 and 33 Vict. c. 115.

DROGHEDA (Ir. "bridge of the ford"), a well-built parliamentary and municipal burgh and seaport, in a county by itself of 9 sq.m., on the borders of Meath and Louth, on both sides, but chiefly n. of the Boyne, 4 m. from its mouth, and 31 m. n. of Dublin. The Dublin and Belfast railway crosses the Boyne here by a viaduct 95 ft. high. There are linen and cotton manufactures, tanning and brewing works, and an iron foundry. It has a considerable trade, chiefly with Liverpool, 140 m. e.s.e., principally in corn, meal, flour, cattle, provisions, linen, hides, and butter. Great quantities of ale are sent to the colonies. Vessels of 500 tons reach the quay, and barges of 50 tons ply 19 m. up the Boyne to Navan. Pop. '71, 13,510, of whom 12,381 are Roman Catholics, 855 Episcopalians, 152 Presbyterians, the rest of other denominations. D. sends one member to parliament. The parts of D. on the opposite sides of the river formed two opposing corporations till 1412, when a sermon by a monk induced them to get a charter of union from Henry I. From the 14th to the 17th century, D. was the chief military station in Leinster. Many parliaments were held in D., and it had the right to coin money. In 1649, Cromwell stormed D. and put 2,000 of the garrison to the sword. Poyning's laws were enacted here. D. surrendered to William III. the day after the battle of the Boyne, which was fought in 1690 at Oldbridge, 4 m. w. of Drogheda. One of the four ancient gates of D. still remains, and the ruins of many friaries and monastic institutions. The port is under a board of commissioners, whose revenue in 1875 was £3,606. In 1875, 706 vessels, of 116,795 tons, entered, and 402, of 104,524 tons, cleared the port.

DROGUE AMÉRE (Fr. bitter drug), a celebrated stomachic bitter; of which the basis is creat root, and the other ingredients mastic, frankincense, myrrh, and aloes, all steeped for about a month in brandy, which is then strained and bottled.

DROHOBICZ, a t. of Austria in the province of Galicia, is situated on the Tyszmanika, a tributary of the Dniester, in lat. 49° 25′ n., and long. 23° 30′ east. The town is in general ill-built, but it contains several interesting edifices, including a Basilian monastery, a castle, a high school, and two very handsome churches. D. has extensive salt-works, which produce about 3,700 tons of salt yearly. There are also in the vicinity iron-mines and pitch-wells. D. has likewise a good trade in wine, linen, cotton, leather, and grocery. It has, besides, corn and cattle markets. Pop. '69, 16,884, seven eighths of whom are Jews, who carry on most of the commerce of this town.

DROIT D'AUBAINE (Lat. *alibi nati*). By the old custom of France, the king was entitled, on the death of a foreigner who had taken up his fixed residence there, to claim his movable estate, notwithstanding any testamentary settlement which he might have left. But when a foreigner went to France as a traveler, merchant, or foreign minister, without any intention of fixing his residence there, the droit d'aubaine was excluded. The Swiss, Savoyards, Scotch, and Portuguese were exempted. This antiquated piece of injustice was abolished in 1819.

DROITS OF THE ADMIRALTY. See ADMIRALTY DROITS.

DROITWICH, a parliamentary and municipal borough in Worcestershire, containing four parishes and three churches, 7 m. n.n.e. of Worcester, in the narrow valley of the small river Salwarp, on the Bristol and Birmingham and West Midland railway, and on a canal connected with the Severn, which admits vessels of 60 tons. It has direct communication, also, by means of other canals, with Birmingham and London and the intermediate district. Its chief trade is salt, for which it has been famous from remote times, and which is esteemed the best in Europe. In the middle of the town, rising from a

depth of 200 ft., through beds of new red sandstone and gypsum, are the celebrated wyches, or brine-springs, yielding over 115,000 tons of salt a year, nearly the half of which is exported to foreign countries. Pop. '71, of the municipal borough, 3,504; of the parliamentary, 9,510. D. sends one member to parliament. It was the Roman salinæ. The remains of a villa were found here, with tesselated pavements, etc.

DROME, a department of France, on the e. bank of the Rhone, to the s. of the department of Isere. Area, 2,500 sq. miles. Pop. '76, 321,756. In the w. of the department, running from n. to s. along the Rhone, stretches a sandy plain of 5 to 8 m. in breadth, but toward the e. the surface is hilly; a spur of the Alps traversing the eastern boundary, and sending offshoots of about 3,500 ft. in average height westward across almost the entire area of Drome. These heights, whose sides are covered with forests of pine, oak, and beech, afford excellent pasturage in summer and autumn. The general direction of the rivers of D. is westward, toward the Rhone, and the most notable of them are the Drome, from which the department takes its name, and the Isere. Vines and mulberry, chestnut, walnut, and olive trees are extensively grown. About 8,600,000 gallons of wine are produced annually. Many of the vineyards are famous, but perhaps the most celebrated is that of L'Hermitage, near Tain, on the banks of the Rhone, which yields red and white wines hardly surpassed by any in the world. D. has several iron-mines, also copper, lead, and to some extent coal. The manufactures consist chiefly of woolen cloth, silk, hosiery, serge, and cotton yarn. The department is traversed by the Lyon and Avignon railway. It is divided into the four arrondissements of Valence, Montélimart, Die, Nyons, with the town of Valence for capital.

DROMEDARY, a name sometimes given, probably at first through mistake, to the Arabian or one-humped camel (*camelus dromedarius*), but properly belonging to a variety of that species, distinguished by slenderness of limbs and symmetry of form, and by extraordinary fleetness. It has been well described as "bearing much the same relation to the ordinary camel as a race-horse or hunter does to a cart-horse." The word dromedary is derived from the obsolete Greek *dremo*, to run. The pace of the D. is a trot, which it can maintain without intermission for a prodigious length of time; often at the rate of 9 m. an hour for many hours together; whilst a journey of upwards of 600 m. is performed at a somewhat slower rate in five days. Even its more rapid pace can be maintained for twenty-four hours at a stretch, without sign of weariness and without stopping to bait; and if then it is allowed a little refreshment, of a ball of paste made of barley and powdered dates and a little water or camel's milk, it will resume its journey, and go on with undiminished speed for twenty-four hours more. The jolting to the rider is terrible. The gallop is a pace unsuitable to the D., and at which it very soon fails. Dromedaries are sometimes trained to run races. White dromedaries are particularly prized in some parts of the east. See CAMEL.

DROMORE (*Druim Mor*, Great Ridge), an episcopal city in the n.w. of the co. of Down, on the Lagan, 14 m. s.w. of Belfast. It has linen manufactures. Pop. '71, 2,408. In the peat-bogs here were found the remains of an elk, the space between the extremities of whose horns measured 10 ft. 3 inches. North of D. is a mound or rath, 60 ft. high, with three concentric intrenchments, and great outworks towards the Lagan. The see of D. was founded by St. Colman in the 6th c., but is now united with those of Down and Connor. Jeremy Taylor, when bishop here, built the present church.

DRONE. See BEE.

DRONTHEIM. See THRONDHJEM.

DROORAJAPATAM, or DOOGOORAUZEPATAM, a t. on the Coromandel coast of Hindustan, possesses remarkable facilities for navigation, both maritime and inland. It stands on an inlet, which connects Blackwood harbor with Pulicat lake, the former being the only safe haven on the w. side of the bay of Bengal, and the latter being artificially continued as far as Madras. The place is 60 m. to the n. of Madras, and 34 to the s. of Nellore, in lat. 13° 59′ n., and long. 80° 13′ east.

DROPSY (Gr. *hydrops*, from *hydōr*, water), a class of diseases always of serious import, though not often, perhaps, directly fatal. D. is rather a symptom than a disease; it consists of the effusion of watery fluid from the blood into the skin and subjacent textures, or into the cavities of the body. When the effusion is chiefly in the superficial parts, the D. is called anasarca (*ana*, upon; *sarx*, the flesh); when it is in the abdomen, it is termed ascites; when in the chest, hydrothorax. D. most commonly depends on disease of the heart (q.v.) or kidneys (q.v.); in cases of ascites, the liver and spleen are often at fault. The treatment of D. is chiefly by diuretics (q.v.), and other evacuant remedies, which remove the fluid from the textures by unloading the blood of its excess of serum. It is, however, a matter of some difficulty to find the proper remedy in each individual case. In all cases of D., the internal organs should be, if possible, submitted to a strict medical examination, and the treatment regulated accordingly.

DROPSY (*ante*). It cannot be too clearly borne in mind that a dropsy is a transudation and not an exudation, and is not a direct product of inflammation, as the latter is. For instance, the fluid which is poured into the cavity of the pleura in pleurisy is not a dropsy, but an exudation of plastic material from the blood, which has the prop-

erty of becoming organized into a kind of pseudo-tissue which forms adhesions between the lungs and the sides of the chest. In dropsy, the fluid has no power of organization, although it contains a slight portion of constituents of blood serum. Exudations have a turbid appearance when they are not colored with the red corpuscles of the blood, but the effused transuded fluid of dropsy is usually quite transparent, although sometimes tinged with the coloring matter of the blood. As a rule, dropsies are caused by obstructions to the return of blood by the veins, and may be general or local. In general dropsy there is an accumulation of watery fluid into the cellular tissue of a part or whole of the body, together with a transudation into one of the serous cavities. Such dropsies are apt to follow diseases of the heart (q.v.). Again, general dropsy may be owing to a morbid condition of the blood in diseases of the kidney (q.v.). It is then called *renal* dropsy, while that caused by disease of the heart is called *cardiac* dropsy. Local dropsies, when existing in the cellular tissue, are circumscribed. Thus, anasarca confined to the limbs would be called a local dropsy, whereas when spreading over the whole body it would be called general, although the cellular tissue only is invaded. For the causes of dropsy of the belly, or *ascites*, see more particularly LIVER, DISEASES OF THE. But ascites, as well as dropsy of other cavities than the peritoneum, may be the result of scarlet fever, which has for one of its sequelæ inflammation of the kidneys. The pressure of a tumor may cause dropsy. Pressure upon the portal vein may be followed by ascites; upon the ascending *vena cava*, or great vein which carries the blood from the trunk and lower extremities to the heart, anasarca of the trunk and lower extremities. When the pressure is upon one of the iliac veins, anasarca of one of the lower limbs is the consequence. The treatment of dropsy depends upon the condition of the organs or parts of the body where morbid condition is its cause. Renal dropsy, besides general treatment, will require remedies calculated to relieve the renal disease, and a similar remark applies to hepatic dropsy. The general treatment for all forms of dropsy includes sometimes the removal of the watery fluid from the serous cavities, and also from the cellular tissue. This is sometimes accomplished by tapping, or *paracentesis*, when the liquid is drawn from a cavity; when from the abdomen, *paracentesis abdominis;* when from the chest, *P. thoracis;* when from the head, *P. capitis.* The withdrawal of the liquid from the cellular tissue is performed by making numerous small punctures. The therapeutical remedies consist of diaphoretics, diuretics, and cathartics; and although they are often employed with more or less benefit, and sometimes assist in recovery, they frequently fail to give the hoped-for relief. Cathartics, especially those which belong to the class called *hydrogogue*, often reduce the amount of liquid considerably; but it generally returns, especially in incurable cases, and the patient is made weaker by the operation; and similar objections hold with regard to diuretics; they often relieve for a time, but are perhaps quite as often unsatisfactory. Both remedies in unfavorable cases may be called necessary evils. Diaphoretics may be given with more freedom, although the objection that they promote debility to a certain extent applies to them also. The use of jaborandi, or its alkaloid, which has been recently introduced into practice in this country, is perhaps attended with more benefit than that of any other diaphoretic. (See JABORANDI.)

DROPWORT. See SPIRÆA and WATER DROPWORT.

DROSERA'CEÆ, a natural order of exogenous plants, consisting entirely of herbaceous plants, which generally inhabit marshy places, and are often covered with glands. The leaves are frequently all radical, and they and the flower-stalks are rolled up in bud like the fronds of ferns. There are 5 sepals, 5 petals, 5, 10, 15, or 20 stamens; the fruit a one-celled capsule, with numerous seeds. About 100 species are known, distributed over most parts of the world, many of them plants of very delicate appearance; and many of them, as the species of *drosera* or SUNDEW, natives of Britain, are remarkable for their glandular hairs, which secrete a viscid fluid, and by means of it often fatally detain flies which alight on them. *Rosidula dentata* is placed in houses in s. Africa on this account. Venus' fly-trap belongs to this order. See DIONÆA. Acrid and stimulant properties prevail in the droseraceæ.

DROSOM'ETER, an instrument for measuring dew. It is a simple balance in even poise, on one scale of which the dew falls, while the other is protected. The weights on the dry scale indicate the amount of dew on the wet scale.

DROSTE-HÜLSHOFF, ANNETTE ELIZABETH, a distinguished lyric poetess of Germany, b. 12th Jan., 1798, on the estate of Hülshoff, near Münster. Of a delicate constitution, and living in complete seclusion from the world, she nevertheless received an excellent scientific education. In the year 1825, she was first introduced into a wider circle of distinguished men and women at Cologne and Bonn, but in a short time retired again to her maternal estate of Rischhaus, near Münster, where she lived almost exclusively for science, nature, and poetry. She died at a place near lake Constance, 24th May, 1848. While occupying a distinguished place among the literary women of the time, she retained all the characteristic timidity of her sex, avoiding those eccentricities into which many women fall who think they have a mission to regenerate society. Her *Gedichte* (Poems) appeared at Stuttgart in 1844, and of her posthumous works *Das geistliche Jahr nebst einem Anhang religiöser Gedichte* at Stuttgart in 1852.

The poems are not only perfect as regards form, but unite a womanly gentleness and poetical creative power in a degree seldom seen in the writings of women.

DROUET, JEAN BAPTISTE, Comte D'ERLON, French marshal, was b. 29th July, 1765, at Rheims, entered a regiment of volunteers in 1792, and took part during the years 1793–96 in the campaigns of the Moselle, Meuse, and Sambre. His important services quickly obtained him promotion. His conduct in the peninsular war was highly distinguished, and elicited the warmest eulogiums from Massena. After the fall of Napoleon, the Bourbons tried to secure his services, and gave him the command of the 16th division, but he was shortly after arrested on the charge of conspiring against the royal family. Managing to escape, he remained in concealment in Lille until the return of Napoleon from Elba, when, putting himself at the head of the troops, he seized the citadel and held it for the emperor, who made him a peer of France. At the battle of Waterloo he commanded the first *corps d'armée*. After the capitulation of Paris, he fled to Bavaria, where he resided until the July revolution, when he returned to France, and received in 1832 the command of the army of Vendée. During 1834–35, he held the important office of governor-general of Algeria, and in 1843 was elevated to the rank of marshal. D. died 25th Jan., 1844.

DROUET D'ERLON, JEAN BAPTISTE, 1765–1844; Count, and marshal of France, governor of Algeria. He was an eminent soldier, serving at the siege of Valenciennes, Quesnoy, and Condé, in the blockade of Ehrenbreitstein, at Zurich, Schaffhausen, and Constance. As general of division he was distinguished at Ulm and Hohenlinden. He was wounded at Friedland, made an officer of the legion of honor, and a peer. He served in the peninsular war. In 1834, he was appointed governor of Algeria, and in 1843 was made a marshal.

DROUYN DE LHUYS, EDOUARD, an eminent French diplomatist and politician, was b. at Paris, Nov. 19, 1805, and studied at the college of Louis-le-Grand and the ecole de Droit. He was at first attached to the embassy at Madrid, whither he proceeded in 1830. In 1840, he was placed at the head of the commercial department under the minister of foreign affairs, and shortly after was elected *député* for Melun; but taking a part hostile to the government, of which he was a subordinate member, he was deprived of his situation by M. Guizot. This gave him fuller scope for the advocacy of his political opinions. He now became an active member of the *Reforme* party, and after the famous banquet of the 12th arrondissement had been interdicted, he signed, along with the other chiefs of the opposition, the accusation drawn up against M. Guizot and his colleagues. Elected representative of the people to the constituent and legislative assemblies, by the department of Seine-et-Marne, he was made first a member and then president of the committee of foreign affairs. Here he acted generally with the moderate party. In the first cabinet formed by Louis Napoleon after his election to the presidency (Dec., 1848), he became minister of foreign affairs, and directed the French policy in all the difficult European complications of the year. In 1849, he went to London for a short time as ambassador, and after the *coup d'état* became one of the vice-presidents of the imperial senate, and again minister of foreign affairs. Being disappointed at the issue of the Vienna conferences in 1855, he resigned his office. In 1863, he was recalled to his old post, resigning again in 1866. On the fall of the empire, he fled for a time to Jersey.

DROWNING. See ASPHYXIA.

DROWNING, as a mode of capital punishment, has only lately ceased in Europe, and is probably still in use in some other quarters of the world. Tacitus, writing about the end of the 1st c., tells us that the Germans hanged their greater criminals, but that meaner and more infamous offenders were plunged under hurdles into bogs and fens. By the law of the ancient Burgundians, a faithless wife was to be smothered in mud. The Anglo-Saxon codes ordered women convicted of theft to be drowned. The punishment was in such common use throughout the middle ages, that grants of capital jurisdiction ran "*cum fossa et furca*," i.e., "with pit and gallows." The pit, ditch, or well, was for drowning women; but the punishment was occasionally inflicted on men. The doom of the parricide was to be put into a sack and cast into the sea. A canon of Prague, afterwards enrolled in the catalogue of saints, was drowned in 1383, for refusing to reveal the secrets of the confessional. In this instance, perhaps, drowning was allowed to the offender as a matter of favor. So in Scotland, in 1556, a man convicted of theft and sacrilege, was sentenced to be drowned, "by the queen's special grace." So lately as 1611, a man was drowned at Edinburgh for stealing a lamb. By that time, the punishment of drowning had become obsolete in England. It survived in Scotland until 1685. The last execution by drowning in Switzerland was in 1652, in Austria in 1776, in Iceland in 1777. It was abolished in Russia early in the 18th century. In Saxony, a woman convicted of child-murder, was sewn up in a sack, along with a cat, a dog, and a snake, and thus drowned, in 1734.

DROYLSDEN, a large and rapidly increasing Lancashire township, a district parish of Manchester, and 4 m. e. from Manchester, a station on the Lancashire and Yorkshire railway. It is situated on an elevated plain, is irregularly built, the houses of brick,

but many of them very neat. The cotton manufacture is extensively carried on; there are also print-fields, dye-works, and copperas-works. Pop. '71, 6,768.

DROY'SEN, JOHANN GUSTAV, b. 1808; a German historian, studied at Stettin and Berlin, teacher in a gymnasium in the latter city, and private tutor in the university. In 1840, he became professor of history at Kiel, and was prominent in politics during the struggle between Denmark and the duchies, being the author of the *Kiel Address*, and one of the nine protesting professors of the university. He was a representative from Kiel in the diet of Frankfort, and subsequently a member of the Frankfort parliament. In 1851, he was professor of history at Jena, and in 1869, filled the same position in Berlin. He made a number of translations from the Greek, and has written several books on modern history.

DROZ, FRANÇOIS-XAVIER JOSEPH, 1773–1850; a French writer on morals and politics, who studied law in Paris. In 1799, he published an essay on the art of oratory; some years later, the romance of *Lina*, other essays, works on moral philosophy, on the science of life, and on the application of morals and philosophy to politics and political economy; also on Christianity, and an elaborate history of the reign of Louis XVI. He was a member of the academy.

DRUGGET, a common felt or other coarse woolen fabric, chiefly used for covering carpets, or as a substitute for a carpet. At one time, also, it was largely used as an aticle of clothing by the humbler classes, and even yet the *drugget petticoat* is far from uncommon, although it is gradually giving place to cotton fabrics, which have the advantage of greater cleanliness, and of being less liable to retain infectious and contagious poisons.

DRUGS, a name applied to all material agents used in the treatment of disease, when in their crude or commercial forms. The medicines ordered by the physician consist of D. prepared by the apothecary or chemist, and made up according to the prescription (q.v.). The business of the druggist is now to a considerable extent separated from that of the medical practitioner, with which it was formerly associated. See CHEMISTS AND DRUGGISTS, and APOTHECARIES.

DRU'IDISM. This institution was, perhaps, common to all Celtic nations, but we have detailed accounts only of the form under which it existed in Gaul. Cæsar gives the following description of the character and functions of the Druids: "They attend to divine worship, perform public and private sacrifices, and expound matters of religion. A great number of youths are gathered round them for the sake of education, and they enjoy the highest honor in that nation; for nearly all public and private quarrels come under their jurisdiction; and when any crime has been committed, when a murder has been perpetrated, when a controversy arises about a legacy, or about landmarks, they are the judges too. They fix rewards and punishments; and should any one, whether a private individual or a public man, disobey their decrees, then they exclude him from the sacrifices. This is with them the severest punishment. The persons who are thus laid under interdict are regarded as impious and wicked people; everybody recoils from them, and shuns their society and conversation, lest he should be injured by associating with them. They cannot obtain legal redress when they ask for it, nor are they admitted to any honorable office. All these Druids have one chief, who enjoys the highest authority amongst them. When he dies, he is succeeded by the member of the order who is most prominent amongst the others, if there be any such single individuals; if, however, there are several men equally distinguished, the successor is elected by the Druids. Sometimes they even go to war about this supremacy. At a certain time of the year, the Druids assemble on the territory of the Carnutes, which is believed to be the center of all Gaul, in a sacred place. To that spot are gathered from everywhere all persons that have quarrels, and they abide by their judgments and decrees. It is believed that this institution was invented in Britannia, and thence transplanted into Gaul. Even nowadays, those who wish to become more intimately acquainted with the institution, generally go to Britannia for instruction's sake.

"The Druids take no part in warfare; nor do they pay taxes like the rest of the people; they are exempt from military service, and from all public burdens. Attracted by such rewards, many come to be instructed by their own choice, while others are sent by their parents. They are reported to learn in the school a great number of verses, so that some remain there twenty years. They think it an unhallowed thing to commit their lore to writing, though in the other public and private affairs of life they frequently make use of the Greek alphabet. . . . Beyond all things, they are desirous to inspire a belief that men's souls do not perish, but transmigrate after death from one individual to another; and they hold that people are thereby most strongly urged to bravery, as the fear of death is thus destroyed. Besides, they hold a great many discourses about the stars and their motion, about the size of the world and of various countries, about the nature of things, about the power and might of the immortal gods; and they instruct the youths in these subjects."

It is easy to comprehend that this powerful priesthood did all they could to uphold the national cause against the Roman conquerors, and urged the people to rebellion; so much so, that the emperor Claudius found it necessary to interdict formally the prac-

ticing of Druidical rites, which seem, however, to have continued down to the extinction of paganism. Besides being priests and teachers of religion, the Druids appear also to have been adepts in the magic arts, and were versed in the mysterious powers of animals and plants. The oak-tree was especially sacred among the Druids. In oak-groves, they frequently performed their rites, and they even derived their name from this custom. See the article CELTS. They also had a special reverence for the mistletoe, when growing on an oak. According to Pliny, a Druid, clothed in white, mounted the tree, and with a knife of gold, cut the mistletoe, which was received by another, standing on the ground, in his white robe. The same author gives a curious account of the "serpent's egg," worn as a distinguishing badge by the Druids. It was formed, he says, by the poisonous spittle of a great many serpents twined together. Gathered at moonlight, and afterwards worn in the bosom, it was a mighty talisman. All these particulars refer properly to the Druids of Gaul, but Cæsar's testimony leaves no doubt that the Druidism of Britain was essentially the same.

In all the countries anciently inhabited by Celts, there are found rude structures of stone, one of the most common forms of which is the so-called *dolmen* (see that article). The older archæologists assumed that these were Druidical altars, but there is no proof that such was their destination or origin: similar structures are found in Scandinavia and many parts of Germany, and to assume in all these countries the presence of Celts, seems too hazardous. The same doubts prevail as to the larger monuments of this kind —the supposed Druidical temples of Amesbury, of Carnac in Brittany, and of Stonehenge (see that article).

DRUIDS, ORDERS OF, various social and benevolent organizations on the masonic plan, widely distributed in England, Australia, and the United States. The first order was formed in London, 1781; the first lodge in New York was organized 1833. In this country, 5 degrees have been added to the entrance degree; degrees have been instituted in England also. There are probably 125,000 members in all the world, of which more than 50,000 are in England, and perhaps 20,000 in the United States. In this country there were, 1870, about 150 "groves," of which number about two thirds were mainly of German membership.

DRUM (*druim*), a Celtic word meaning the back, and applied to a ridge of hills, enters into the composition of many names of places, especially in Ireland, as Drumcondra, Drumglass, Drumsheugh.

DRUM (Gr. *trommel;* Fr. *tambour*—a modification of *tabour; timbrel* and *tambourine* are other forms of the word *tabour* or *tambour*), a hollow cylinder of wood or metal, having skin (parchment) stretched across one or both ends, upon which the drummer beats with an instrument of wood or metal called a *drumstick*. The drum is used as an instrument of music along with other instruments in bands, and particularly for military purposes. The military drum serves for giving various signals as well as for music. There are three kinds of drum—the *side* drum, the big or *base* drum, and the *kettle* drum. Since 1858, the British infantry are supplied with brass side drums, 3 lbs. lighter than those formerly in use, and tuned with screws instead of straps and ropes. The cavalry drum is a copper or brass hemisphere, thus resembling a *kettle*, with a parchment lid. The big drum has both ends covered with parchment. The ancient Romans used small hand-drums—some resembling tambourines, others kettle-drums—in their religious dances; and the Parthians are said to have used them in war to give signals. They are believed to have been first brought into western Europe by the crusaders.

DRUM, a name given to a fashionable and crowded evening-party about the middle of the 18th c., at which card-playing appears to have been the chief attraction. The names drum, rout, and hurricane, by which these gay assemblies were known, sufficiently indicate their noisy, promiscuous, and irrational character. Lady Mary Wortley Montagu, writing from Louvère to her daughter in 1753, hints that ladies gave these entertainments to make money at cards to support their extravagance; and adds: "I find I should be as solitary in London as I am here, it being impossible to live in a *drum*, which, I think, so far from a cure of uneasiness, that it is, in my opinion, adding one more to the heap." See ROUT.

DRUM, SACRED, an object of religious veneration and instrument of magical incantation among the Laplanders in former times. It was hollowed out of a piece of the trunk of a pine or birch, in which certain peculiarities were required, and was covered with skin on the upper side only, the wood being partly left on the under side to serve as a handle. Figures were painted in red on the skin; the drumstick was a reindeer's horn; and to the drum were appended a large copper ring and some smaller rings. The drum was considered a necessary part of the furniture of every family. The motions of the rings, when the drum was beaten, which might be done only by the head of the family, were supposed to afford indications concerning the results of disease and other future events. The beating of the drum was accompanied with songs, and the person by whom it was beaten often fell into a trance, during which revelations were supposed to be made to him. The sacred drum seems to have been somehow connected with the worship of the sun.

DRUM-FISH, *Pogonias chromis*, of the family SCIENIDÆ, a fish allied to the *sheep's-head*, and inhabiting the shores of the United States, from New York to Florida, in schools. They vary from 2 to 4 ft. in length, and 15 to 18 in. in breadth, weighing from 10 to 25 lbs. Sometimes they are larger, weighing as much as 80 lbs. Scales large, stout, oblique; teeth on the jaws in a band. Pharyngeals with large paved teeth. Tongue broad, short, smooth; branchial rays, seven; dorsal fin has 10 stout, flattened rays, capable of being concealed in a furrow. Second dorsal fin rises at the termination of the first; pectoral fins large and pointed; air-bladder large and thick coated; spleen very long; stomach thick and muscular, with strong muscular columns; vertebræ, 24; color, bronze to red, rather lighter beneath, with a blackish spot behind the pectoral. There are two varieties according to De Kay, one dark brown, the *black drum* of the fishermen, the other the *red drum*. They are coarse food, but the young are regarded as a delicacy. The fish of this genus are remarkable on account of the noise which they make under water, which resembles that of a distant drum, and there is a difference of opinion as to the cause. Cuvier thought it had some connection with the air-bladder; De Kay attributes it to the compressing together of the broad pharyngeal teeth, and so do most of the fishermen, but they also believe that the trituration of the shell-fish upon which they feed is the more immediate cause of the sound. They often afford good sport in the catching; the line is baited with soft clams or muscles, the shell being left on.

There is another species of drum-fish described and figured by De Kay, the *pogonias fasciatus*, much smaller, from 7 to 10 in. long, having four or five blackish vertical bands extending down the sides; the pectoral fins are a faint yellow, the others dark brown. This has been supposed to be the young of the *P. chromis*, but De Kay has seen them 6 in. long in Sept., having all the characteristics of the adult fish. Its teeth and jaws, as well as stomach, resemble those of the larger fish. It has various names, as *young drum*, *grunter*, and *young sheep's-head*.

DRUM-MA'JOR, as a component member of a regiment, was not much known in the English army till the time of Charles I. There was in earlier times an officer in the royal household called the *drum-major general*, without whose license no one except royal troops might use a drum; but this office fell into disuse. The drum-major, when regularly established, received orders from the major of the battalion concerning the necessary beats or signals, and communicated them to the drummers. The management of the big drum, and the teaching and control of the drummers generally, still devolve upon the drum-major. The "beats" at present adopted by the British infantry were composed by drum-major Potter of the Coldstream guards.

DRUMMER is a component member of every British regiment. His position is slightly superior to that of the private soldier, but still he is reckoned as one of the rank and file. Besides his ordinary duties (see BEAT OF DRUM), the drummer performs the *drumming out* when a soldier is discharged with ignominy. See DISCHARGE. To the drummers is also intrusted the repulsive duty of flogging, when that sentence is passed upon soldiers. A *drum-head court-martial* (not now much adopted) has no particular connection with the drummers, but is a hasty council or court-martial held in the field around the big drum.

DRUMMOND, a co. in the province of Quebec, Canada, intersected by St. Francis river; 600 sq.m.; pop, '71, 14,281.

DRUMMOND, Captain THOMAS, R.E., was born at Edinburgh in 1797, and during his professional training at Woolwich and Chatham displayed high mathematical and mechanical abilities, with much aptitude for the application of scientific principles to practical affairs. In 1820, he was engaged by col. Colby to assist in the trigonometrical survey of the United Kingdom. The incandescence of lime having been brought under his notice at a lecture on chemistry, the idea occurred to him that it might be advantageously used on the survey to render distant objects visible: he accordingly made experiments, which, with their results, and the first application of the Drummond light (q.v.) in Ireland, are described by him in the *Philosophical Transactions* for 1826. A heliostat (q.v.) of his invention, described in the same paper, has ever since been employed with success in the survey. Experiments which he made with the view of adapting his "*Light*" to light-houses, are detailed in the *Philosophical Transactions* for 1830. When exhibited at Purfleet, it was powerful enough to cast shadows at Blackwall, distant 10 miles. Practical difficulties, not yet overcome, prevented the fulfillment of his hopes in this direction; his attention having been diverted to political life, for which he soon proved himself to be eminently fit. As the head of a commission appointed by lord Grey's government to superintend the fixing of the boundaries of the boroughs under the provisions of the reform bill, he performed most ably that laborious and important work. He next acted as private secretary to lord Althorp, chancellor of the exchequer; and finally, in 1835, went to Dublin with lord Mulgrave, as under-secretary for Ireland. Here the knowledge of Irish character and feelings which he had acquired in the survey was of great advantage to him, and by his impartiality, sound judgment, conciliatory disposition, indefatigable energy, and hearty devotion to the work before him, he at once gained the confidence and affection of the people. It was in a letter written by him to the magistrates of Tipperary on the 22d of May, 1838, that the memorable words

occurred—"Property has its duties as well as its rights;" an aphorism which instantly flew over Ireland, and continues everywhere to exercise a wholesome influence. But it was perhaps as the head of a commission appointed in 1836 to report on a railway system for Ireland, that D. rendered that country his greatest service by the admirable report which he had the main labor of producing. So far as the routes recommended have been followed, the expectations of the commissioners have been fulfilled or exceeded; and it is the opinion of good judges that it would have been well for Ireland had the carefully digested scheme been more fully adopted. By these multiplied labors, however, D.'s strength was overtasked, and he sank on the 15th of April, 1840, amidst the grief of the Irish people, and of his intimates in public life, who had hoped to see him rise to some of the highest offices in the state. A statue by Hogan was erected to his memory by public subscription, in the royal exchange at Dublin; and a memoir of his professional life (abridged in Knight's *English Cyclopædia of Biography*, ii. 647) was published in 1841 by capt. Larcom, R.E., in the 4th volume of *Papers on Subjects Connected with the Duties of the Corps of Royal Engineers.*

DRUMMOND, WILLIAM, OF HAWTHORNDEN, a poet of considerable celebrity, was descended from a very ancient and noble Scottish family, and was b. 13th Dec., 1585. He was educated at the high school of Edinburgh, and afterwards at the university of that city, where he took his degree of M.A., July 27, 1605. On leaving college, he was sent to the continent in order to study law, for which he exhibited great aptitude. He returned in 1609, and his father dying in the following year, he retired to the paternal estate at Hawthornden, which, according to the learned Ruddiman, "was a sweet and solitary seat, and very fit and proper for the muses;" and there, with an interval of 8 years of foreign travel, spent his life in his favorite literary pursuits. He died 4th Dec., 1649; his death, it is said, being hastened by his excessive grief for the fate of Charles I. His principal works are the following: *Tears on the Death of Moeliades*—prince Henry, son of James I.—(Edin. 1613); *Poems: Amorous, Funerall, Divine, Pastorall, in Sonnets, Songs, Sextains, Madrigals* (1616); *Forth Feasting* (1617); *Polemo Middinia* (Oxford, 1691). After relinquishing poetry, he wrote a sectional history of Scotland, known as the *History of the Five Jameses.* A standard edition of his poems was edited for the Maitland club by Dr. Irving and lord Dundrennan in 1832. Smaller editions appeared in 1833 and 1856, and an exhaustive life, with an account of his writings, by prof. Masson, in 1873. D. enjoyed the friendship of many of his literary contemporaries, including Drayton and "rare" Ben Jonson, the latter of whom visited him at Hawthornden in 1619. D.'s *Notes of Ben Jonson's Conversations with William Drummond of Hawthornden,* is a characteristic record of the literary spirit of the time.

D.'s verse abounds in the conceits, antitheses, and hyperboles of the period, and gives indication of a mind indulging itself in melancholy. His sonnets are the best specimens of his muse, although even in them one looks in vain for sustained harmony or great originality of thought.

DRUMMOND, Sir WILLIAM, 1760–1828; an English diplomatist, author of a *Review of the Government of Sparta and Athens; Origines, or Remarks on the Origin of Several Empires, States, and Cities,* etc. In 1796 and 1801, he was a member of parliament, and was made diplomatic representative in Naples and Constantinople. In *The Œdipus Judaicus* he undertook to explain some of the Old Testament narratives as being astronomical allegories, for which he was very sharply censured.

DRUMMOND ISLAND, within the limits of Canada, is in lake Huron, being the most westerly of the Manitoulin chain. It measures 20 m. by 10, and lies about 30 m. to the e. of Mackinaw, an island in the strait of the same name, which pours lake Michigan into lake Huron.

DRUMMOND LIGHT, or LIME-BALL LIGHT. The heat given out during the combustion of a mixture of hydrogen and oxygen gases, or of coal-gas and oxygen, is very intense; and when the mixture is directed on an infusible substance such as lime, a most brilliant light is evolved. Capt. Drummond, R.E., originally proposed the employment of this light in the trigonometrical survey of Great Britain, and constructed apparatus for its production. See DRUMMOND, THOMAS. In the most convenient form of the apparatus the mixed gases escaping by a jet, being set fire to and made to impinge upon a cylinder of lime, raise the surface of the latter nearest the jet to a white heat, accompanied by a dazzling light. As minute portions of lime become detached and are volatilized from the spot on the lime on which the jet of burning gases strikes, it is necessary to expose a new surface of lime to the gases, and for this purpose a screw may be turned by the hand or by clockwork. The hydrogen and oxygen ought to be confined in separate gas-holders or bags, and to be brought by different tubes, provided with separate stop-cocks, to within a short distance of the exit jet. The common tube through which the mingled gases pass to the jet is about 6 in. long by two thirds of an inch in diameter; and in Mr. Hemming's construction the tube is very closely packed, full of very fine brass wire, which is afterwards wedged in by a stout wire being driven down the center. The object of the fine wires is to prevent the return of the flame, which might lead to a disastrous explosion. When the rays from this light are concentrated by a parabolic reflector, it can be seen at immense distances. Thus, on the 31st Dec., 1845, at half-past 3 P.M. (daylight), the light was exhibited on the top of Slieve

Donard, in county Down, and was seen from the top of Snowdon, a distance of 108 m.: and in other instances the D. L. has been seen at distances up to 112 miles. The employment of coal-gas instead of hydrogen has greatly increased the applications of the D. L., and it is now often used in magic-lanterns and other apparatus where great brilliancy and penetration of light are required. It has been used lately on the continent with great effect in illuminations. Great caution should at all times be exercised in the preparation, storing, and employment of the gases, as many dangerous explosions have occurred. Little heat is evolved from the D. L., nor does it vitiate the surrounding air, or consume its oxygen.

DRUNKENNESS. See INTOXICATION, and also TEMPERANCE.

DRUPA'CEÆ, a species of plants, placed by many as a sub-order of *rosaceæ*, having a one-celled, one-seeded indehiscent fruit, consisting of a fleshy, succulent exterior, and hard stone in center containing seed, such as the peach, plum, and cherry.

DRUPE, in botany, a succulent fruit containing a single seed or kernel, usually inclosed in a hard "stone," the *endocarp*. The succulent part is the *mesocarp*. Examples are familiar in the fruits generally known as stone-fruits, the peach, plum, cherry, etc. In the almond, the mesocarp is not succulent, yet the fruit otherwise possessing all the characters of a D., receives that name. It may be regarded as intermediate between a D. and a nut. The fruits of the genus *rubus* (raspberry, bramble) are composed of many small aggregated drupes, upon a common receptacle. The date is a D. in which the hard "stone" is represented by a membrane.

DRURY, DRU, a goldsmith, silversmith, and cutler, in London, where he was b., 4th Feb., 1725, was devoted to the study of entomology and the collection of exotic insects His *Illustrations of Exotic Entomology* (2 vols., Lond. 1773–82), a work unrivaled at the time of its publication for the accuracy and beauty of its figures, is still in high repute as a book of reference. D. was also assiduous in his endeavors to acquire information concerning the habits of insects. He died 15th Jan., 1804.

DRUSES, a remarkable people who inhabit a district in the n. of Syria, comprising the whole of the southern range of Mt. Lebanon and the western slope of Anti-Lebanon. In this district they hold exclusive possession of about 40 towns and villages, and divide the possession of about 200 more with the Maronites (q.v.), while 80 villages in other parts of Anti-Lebanon are peopled by them. The inhabitants of the Lebanon afford a remarkable illustration of the amalgamation of races. After the second captivity of Israel, Esarhaddon repeopled the wasted strongholds of Samaria with certain fierce tribes, some of whom, called in the Scriptures Cuthites, and known in subsequent times to the Greeks as Carduchi, and familiar to us as Kurds, settled in Lebanon. From them the present D. are supposed to have originally sprung. More than a thousand years later, a fresh colonization took place. The Mardi, a warlike tribe who dwelt to the n. of the Caspian, originally of Persian extraction, were transplanted thither by Constantine IV., in 686 A.D., to the number of 12,000, to act as a bulwark against Mohammedan invasion. The Arabs also, in sweeping through the mountain fastnesses, left a permanent impression there. Thus, Cuthites, Mardi, and Arabs, or rather Mohammedans of various races, have combined to form that strange being—the modern Druse. It has also been supposed by some that there runs in his veins not a little of the blood of the crusaders, but this is doubtful. No immigrations, however, of any importance into the country of the D. took place after the close of the 10th c.; and this period seems naturally to conclude the first great section of Druse history.

The nationality of these mountaineers having now been consolidated, their peculiar and mysterious religion began gradually to be developed. Hakem Biamr Allah, or Bemrillah, caliph of Egypt, and a Nero in cruelty, was the author of this system. He affirmed that he was the representative of God, and, having enlisted his confessor, Darazi, in his cause, he prepared to propound his doctrine. In the 407th year of the hegira (1029 A.D.), the divine nature of Hakem, or rather the incarnation of the spirit of God in him, was publicly announced at Cairo. This revelation, however, was unfavorably received by the mob. Hakem's confessor, Darazi, narrowly escaped the fate of a martyr to the impostures of his master. Retiring, however, to the fastnesses of the Lebanon, he there began to inculcate the principal of the new faith; and although he never acquired any mastery over the sympathies of the mountaineers, he at least left his name to them; for there can be little doubt that the name Druses is derived from that of Darazi. Hamzé, a Persian mystic, and successively the disciple and vizier of Hakem, introduced into the newly promulgated religion all the elements of attraction and strength which it possesses; and him the D. venerate as the actual founder of their faith.

The D. form one of the very few sects among whom proselytism is discouraged. They are remarkable conservatists. For 800 years they have maintained a distinct religious and political independence and nationality. Into their faith the doctrines of the Pentateuch, the Christian gospel, the Koran, and the Sufi allegories, are wonderfully interwoven. They reject, however, the seven points of Islamism, substituting for them the following seven:—1. Veracity (to each other only); 2. Mutual protection and resistance; 3. Renunciation of all other religions; 4. Profession of the unity of Hakem

as God; 5. Contentment with his works; 6. Submission to his will; 7. Separation from those in error, and from demons. They believe in one God in whom there are no parts, to whom they ascribe no attributes, before whom the tongue ceases to utter, the eyes to behold, but who has revealed himself ten times upon the earth under the form and name of mortal men. In Hakem, so Hamzé taught, had God revealed himself for the tenth and last time. They also believe that the number of existing souls never varies, and that all the souls in life now, have lived, vested in some human form, from the beginning of the world, and will so continue to exist till the end of it; that when a man dies, his soul puts on a fresh humanity, which occupies a rank in moral dignity corresponding to the purity or impurity of the past life. But although they believe, in this sense, in the transmigration of souls, they also believe that after the lapse of ages, when the soul will have been purified from every stain, there will come a period of rest. As a religious body, the D. are divided into two classes: the Akals, or those initiated into the Druse mysteries; and the Djahils, the uninitiated. The former do not adorn themselves with gold, or wear silk, embroidered, or fanciful garments; they forbear using wine, spirits, tobacco, and other luxuries, never swear, utter obscene language, or lie. The latter are free from all religious duties. But, however rigid the profession of the Akal or initiated Druse, he is taught that his practice may be conducted in some cases on the principle of expediency. To be truthful, he is taught, is desirable; but when concealment is necessary, then equivocation, or even falsehood may be practiced.

Previous to 1840, Druse and Maronite lived on terms of intimacy and friendship. At that period, however, dissension sprung up between the two tribes, and proved to be the introduction to years of intermittent warfare. The strife reached its climax in 1860. From May to Oct. of that year, accounts of the fearful barbarities practiced by the D. upon the Maronites followed each other with appalling frequency, until the indignation of Europe was roused against them. A conference of the five powers which had guaranteed the independence of Turkey met at Paris, and it was resolved that a French army should proceed to Syria to chastise the D., and that, at the same time, a European commission should, on the spot, make inquiry as to the facts. The troops reached Syria in Aug., 1860. They could not, however, get at the D., who retired into the desert of the Haouran. In the meanwhile, it was ascertained beyond all doubt that the Turks, and the low fanatical mob of Damascus (who have frequently been confounded with the D., because they fomented their passions), were mainly chargeable with the crimes that had been committed; and that the retaliation of the Maronites was equally vindictive and horrible. It is stated that the Maronite leaders—in most cases bishops—on being asked to furnish sworn lists of such of the D. as, from the unusual atrocity of their crimes, were worthy of death, sent in a list demanding 4,846 heads; refusing, however, to bring forward any particular charges. Punishment was inflicted on those who were really to blame. While the French troops remained in Syria, the Turks were compelled to punish the chief Mohammedan criminals, a considerable number of whom, including Achmet Pasha, the governor of Damascus, were shot. In June, 1861, the troops returned to France, and the commissioners drew up a new constitution for the Lebanon, finally revised and signed on 6th Sept., 1864. Under it, the Lebanon is to be ruled by a Christian governor, appointed by the porte; and to be divided into seven districts, under chiefs of the prevalent religion in each. The result was the appointment, as governor, of Daoud Pasha, an Armenian Christian, and of 7 chiefs (4 Maronite, 1 Druse, 1 orthodox Greek, and 1 separatist Greek). The constitution did not satisfy the Maronites, whose revolt, under Joseph Karam, kept the Lebanon in a very unsettled state till 1867. During this period, the governor had to restrain the D. from attacking the Maronite villages in the absence of their defenders. The D. are about 80,000 in number; they are a brave, handsome, and industrious people, and can almost all read and write. They had no superior educational establishment until Daoud Pasha founded and endowed one at Abey. Polygamy is unknown among them. They have, with incredible toil, carried the soil of the valleys up and along the hillsides, which are laid out in terraces, planted with mulberry, olive, and vine. Their chief trade is the manufacture of silk. Corn is also raised, though in very small quantity. Deir-el-Kammar is the principal town. See *Druses of the Lebanon*, by the earl of Carnarvon; Guy's *La Nation Druse.*

DRUSIUS, or VAN DEN DRIESCHE, JOHANNES, 1550–1616; a native of Flanders, an orientalist, and Protestant divine. He went to England when young, and became professor of oriental languages at Oxford. In 1576, he returned to his own country, and was given the same professorship in Leyden. He was subsequently professor of Hebrew in the university of Franeker, in Friesland, He had a son John who mastered Hebrew before he was nine years old.

DRUSUS, the name of a distinguished family of the gens Livia, which contributed a large proportion of eminent men to the Roman commonwealth. The most conspicuous of the Drusi were: 1. M. LIVIUS DRUSUS, tribune of the people in 122 B.C., who made it the business of his public life to thwart the democratic policy of his colleague, C. Gracchus, and uphold the cause of the senate and nobles, which he did with much skill and ultimate success. 2. His son, who bore the same name as himself, and whose

dangerous and daring political intrigues, conducted partly for the benefit of the aristocratic party whose sympathies he inherited, and not less for his own aggrandizement, kept Rome in perpetual turmoil and disorder from 100 B.C. till his death in 91 B.C. Though identified by birth and sympathy with the patricians, Drusus, to win the people, renewed some of the most liberal measures of the Gracchi, and carried agrarian and frumentarian laws. During the latter years of his life, he contrived to gather into his own hands the threads of the various political movements which resulted in the social war; but his almost incredible pride and arrogance had made him so many enemies, that his death, in the flower of his age, was regretted as little by his friends as by his foes. 3. The most illustrious of the Drusi was Nero Claudius Drusus, commonly called Drusus senior, the stepson of the emperor Augustus, and younger brother of the emperor Tiberius. He was born in 38 B.C., and as he grew up, developed splendid personal qualities as well as the highest capacity for civil and military affairs. He began his public career in 19 B.C., and signalized himself when only 23 years old by his defeat of the Rhæti and other Alpine tribes which infested the n. of Italy. In 13 B.C., he was sent into Gaul, then in revolt, and, after crushing the rebels there, pushed across the Rhine in pursuit of their German allies. In this campaign he subdued the Sicambri and Frisii, and forced his way to the German ocean, being the first Roman general who had done so. From this time he made the business of his life to establish the Roman supremacy in Germany, partly by conquest, and partly by the execution of great military works. Among these latter may be mentioned the canal joining the Rhine with the Yssel, the two bridges over the Rhine itself, and the embankments of the Vahalis, the Waal. In 11 B.C., he conquered the Usipetes, the Cherusci, and the Suevi; in the following year, the Chatti, the Nervii, and was prosecuting the work of subjugation in 9 B.C., when a fall from his horse cut short his brilliant career in his 30th year. For his exploits in Germany, D. was rewarded with the title of Germanicus, but care must be taken not to confound him with the celebrated Germanicus, his own son. See GERMANICUS.

DRUSUS CÆSAR, usually called Drusus junior, d. 23 A.D.; and son of Tiberius by his first wife. He was made quæstor in 10 A.D., consul in 15 A.D., but degraded the office by his excesses, and his father sent him with the army to Illyria. In 22 A.D., he was made *tribunicia potestas*, and looked upon as heir to the throne. Deeming Sejanus to be his rival, Drusus struck him in the face; whereupon Sejanus persuaded Livia, the wife of Drusus, whose affections Sejanus had beguiled, to poison him The death of Drusus was charged to intemperance, but eight years afterwards the crime was confessed.

DRY PILE, a voltaic battery without liquids, supplying a feeble electric current. A usual form is with disks of copper and zinc papers in pairs, back to back, and packed in glass tubes—all the copper surfaces in one direction.

DRY'ADS, an inferior order of deities in the mythology of Greece. Their name is derived from the Greek word for an oak-tree (*drus*). They were looked upon as the guardians of the larger kinds of forest trees, along with which they came into being, and with which they died.

DRYDEN, JOHN, was b. at Aldwinckle, in Northamptonshire, on the 9th Aug., 1631. His father, Erasmus Driden, was the third son of sir Erasmus Driden, created a baronet in 1619. D. received the rudiments of his education at Tichmarsh, and was afterwards admitted a king's scholar at Westminsters chool, under Dr. Busby. Here in 1649, he wrote an *Elegy on the Death of Lord Hastings*, and some commendatory verses on the *Divine Epigrams* of his friend John Hoddesdon; both of which performances were published in 1650. In May, 1650, he was elected to a schoralship in Trinity college, Cambridge; he took the degree of Bachelor of Arts in 1653–54; and was made Master of Arts in 1657. His father dying in 1654, put him in possession of an estate worth £60 per annum, of which sum his mother had life-interest in a third. After leaving the university, he proceeded to London, under the patronage of sir Gilbert Pickering, who was faithful to the protector, and seems to have aroused for the time the same feeling in his protégé, whose first poem of importance was entitled *Heroic Stanzas on the Death of Cromwell.* On the return of Charles II., D., with equal splendor of diction, and perhaps with equal sincerity, congratulated the restoration.

The publication of a poem, entitled *Astræa Redux*, led to a breach between the poet and the family of sir Gilbert Pickering, and he now became author by profession. He turned his attention to the stage, planned *The Duke of Guise*, and wrote his first acted play, *The Wild Gallant.* In Dec., 1663, he married a daughter of the first earl of Berkshire, with whom he received a portion; and in 1670, he was appointed poet-laureate and historiographer, with a salary of £200 a year. He afterwards entered into an engagement with the theaters to supply them with three plays each year, for which he was to receive annually from £300 to £400; but as he did not fulfill his share of the contract, it is not probable that the theaters fulfilled theirs. In 1671, the duke of Buckingham produced his attack on the English heroic drama, of which D. was the head. This satirical piece was entitled *The Rehearsal,* and when it was brought on the stage, the town was amused. Although personally satirized, D. endured his castigation in silence, and, waiting his opportunity, immortally revenged himself on the witty and profligate

duke in the *Absalom and Achitophel.* This magnificent satire arose out of the political commotions of the times, and is an elaborate defense of the king against the whig party. Charles II. is *David;* Monmouth, *Absalom;* Cromwell, *Saul;* Buckingham, *Zimri;* and Shaftesbury, *Achitophel.* Its success was amazing; it ran through five editions within the year. This great poem appeared in 1681; and enraged at its success, D.'s enemies hovered around him like a cloud of venomous gnats. In the same year he published *The Medal.* Elkanah Settle, one of the most virulent of his foes, replied with some effect; and D., thoroughly roused, issued next year the *Mac Flecknoe,* and the second part of *Absalom and Achitophel.* These satires were as overwhelming as the Italian battles of the first Napoleon; D.'s enemies were crushed forever, and he remained during his lifetime the undisputed king and lawgiver of English literature.

After the death of Charles II., D. became a convert to the Roman Catholic faith. This event was announced to the world by the publication of *The Hind and Panther,* in 1657. For this change of faith, he has been much abused. Macaulay calls him "an illustrious renegade." Mr. Bell, one of his biographers, strenuously defends his conscientiousness. At the revolution, he was deprived of his laureateship, and somewhat straitened in circumstances, he fell back upon his old occupation of writing for the stage. His translation of *Virgil* was begun in 1694, and completed by the close of 1696. A month after the publication of *Virgil,* appeared the *Ode on Alexander's Feast.* In 1698, he commenced his *Fables,* and completed them in a year and a half. His last work was a mask, with prologue and epilogue. He died on the 1st May, 1700, and was buried in Westminster abbey, where a monument was erected to his memory by John, duke of Buckingham.

Although the great bulk of D.'s works are composed of plays, and although these are, for the most part, devoid of character, feeble in sentiment, false to all external nature, and exaggerated in expression, he remains one of the prime glories of English literature. His *Satires* and his *Fables* are masterpieces. In these, he is almost always masculine and natural, and his versification flows on broad, deep, and majestic. Nor is it only as a poet that he excels; his prefaces and *Essays on Dramatic Poesy* prove him to be a master of "that other harmony of prose." His works in 18 vols. were edited by Scott.

DRYING-MACHINES. The ordinary process of drying clothes and fabrics by exposure in the open air, has been found too tedious for the bleacher, dyer, and for large laundry establishments; and hot-air chambers have been extensively used; but a great improvement has been lately made by using the principle of centrifugal force to throw off the greater part of the moisture. The drying-machine commonly used consists of two drums or cylinders open at the top, the inner one, into which the goods are packed, is perforated at its sides, and made to revolve with great velocity either by steam, water, or hand-power. The action of the drying-machine is precisely the same in principle as that witnessed when the housemaid is *trundling* a mop, or of the dog when he shakes himself on coming out of the water. The use of the outer cylinder is merely to catch the drops of water thrown out, and prevent the inconvenience that would result from its distribution through the apartment. A pipe connected with this outer drum carries the water away. The drying is not, however, quite completed by such machines; a very slight degree of moisture, just perceptible to the touch if the goods are pressed against the cheek, still remains. This is expelled by open-air or hot-chamber drying. These drying-machines are commonly called "extractors" by dyers. A simpler and cheaper drying-machine has been lately introduced for domestic use. It consists of two rollers mounted parallel, and one above the other, with an adjustment to vary the distances between them. One end of the article to be dried is inserted between the rollers, which are then brought as close as possible together, and one roller is turned by a handle, the other, being free to revolve, turns also as the clothes pass between them—the moisture in this case being extracted by pressure, as in the common process of "wringing."

DRYING OILS. See OILS.

DRYNESS, a technical term in painting, used to indicate a style in which the drawing is hard, angular, and formal, and the color deficient in harmony and mellowness, though not necessarily in power or richness. The earlier works, both of the Italian and Flemish schools, all more or less partake of this defect; and it is the most prominent characteristic of those of their imitators to whom the name of pre-Raphaelites has been given.

DRYOBA'LANOPS. See CAMPHOR.

DRY'OPHIS, a genus of serpents of the family *colubridæ,* allied to *dendrophis,* and, like those of that genus, of very elongated form, and living mostly among the branches of trees, but distinguished by a projecting muzzle—a curious prolongation of the upper jaw, which in some is slender, in some leaf-like. They are natives of the East Indies, Madagascar, and tropical America.

DRY-POINT, a sharp etching-needle, used to incise fine lines in copper, without the plate being covered with etching-ground, or the lines bit in by acid. See ENGRAVING.

The work produced by the dry-point is not only very delicate, but it wears less in printing than lines produced by the action of acid. Fairholt's *Dictionary of Art Terms.*

DRY PROCESS, in photography. Reference to the article COLLODIONIZED PAPER PROCESS will show that the collodionized glass-plate, on being withdrawn from the bath, previous to, and during exposure in the camera, has mechanically adhering to its surface a quantity of solution of free nitrate of silver, and it is partly upon the presence of this salt that the extreme sensitiveness of wet collodion plates depends. This, however, is not the sole cause of sensibility to actinic rays; carefully conducted experiments fairly lead to the assumption, that the molecular arrangement of the ultimate particles of iodide of silver, and of the pyroxyline, forming, as it were, the network of the film while wet, materially affect this necessary condition; and it is the object of what is termed a *dry process* to preserve this molecular arrangement as far as possible unaltered, notwithstanding the disturbing influence which would necessarily be exerted by the desiccation of the film. This desirable end for traveling photographers is accomplished with more or less certainty by the employment of solutions of various substances, which are poured over the film after the adhering nitrate of silver has been removed by copious washing with water. The heterogeneous character of the substances so used goes far to prove that their action is principally *mechanical*, they being selected from the animal, vegetable, and mineral kingdoms. Among the first may be mentioned honey, gelatine, glycerine, milk, and albumen; among the second, syrups, gum, wine, beer, balsams, and resins added to the collodion, and linseed tea; and among the third, chloride of calcium, nitrate of zinc, and nitrate of magesia. The plate, on its removal from the sensitizing bath, being well washed with water, any one of these substances is dissolved in water in suitable proportion, and applied to the surface of the plate by pouring on and off several times. It is then set up to drain and dry on folds of bibulous paper in a dark closet or box. The plate is then ready for use. The pictures obtained on plates so prepared do not suffer by comparison with those taken by the wet collodion process; the only drawback to their use being a slight diminution in the degree of sensibility to light.

DRY ROT, a kind of decay, often very rapid, to which timber is subject, without the presence of much moisture. It has proved ruinous to many valuable edifices, and has been the cause of many serious accidents. The ends of joists are often affected by it, so that upon being burdened with even a slight additional load, they are ready to break off by the wall; and the process of destruction has often gone far without a suspicion being entertained of anything wrong. Dry rot is occasioned by *fungi*, the *mycelium* of which diffuses itself through the substance of the timber, destroying its texture, and reducing it to a fragile or even friable mass. *Merulius lacrymans*, *M. vastator*, and *polyporus destructor* (see AMADOU), are species very commonly productive of this mischief; the first being the most common and formidable dry-rot fungus in Britain, and the last having the same pre-eminence in Germany. Its German name is *hausschwamm*. Other fungi, however, produce the same effects where none of these are present; but besides the species which are well ascertained, there are some forms of mycelium not unfrequently occurring as dry rot, of which it is uncertain to what fungus they ought to be referred, as they have not been observed to develop themselves in any perfect form, whilst also it is not known what different modifications of appearance the mycelium of the same fungus may exhibit in different circumstances. Very destructive ravages have been ascribed to different species of *sporotrichum*, particularly in the naval yards of Britain; but the genus is altogether a doubtful one, and not improbably consists of mere forms of undeveloped mycelium. Several species of fungi are often present together in timber affected with dry rot. Some of them penetrate deeply into the substance of the timber, others spread more superficially, but attract moisture from the atmosphere, which hastens decay. This is the case with *merulius lacrymans*, which first appears in small white points; a filamentous substance, radiating from these, gradually forms broad patches, sometimes many feet in diameter; from these, long creeping shoots often proceed, and a net-work of filaments penetrates into every crevice. The species of *polyporus* more generally fill the whole mass of the timber with delicate filaments, which destroy the cohesion of its fibers. *Dædalea quercina* appears in the form of leathery laminæ, often in the strongest oak, and the delicate threads of mycelium penetrate every duct and cavity, reducing the whole to a fungous mass. Beautiful orange tufts sometimes appear, supposed to be the mycelium of species of *coprinus*.

Of the causes of dry rot, stagnation of air, as behind a wainscot or under a floor, is certainly one of the chief, and a knowledge of it suggests means of prevention which may often be easily and most advantageously employed. Another principal cause is insufficient drying of the timber itself; and much of the prevalence of dry rot is not improbably due to the practice of felling oak in spring for the sake of the bark, when the wood is full of sap. Any circumstance which may tend to render the sap acidulous, greatly increases the liability to dry rot. The production of fungi takes place with unusual rapidity when by fermentation or otherwise an acidulous condition of organic substances is produced. A fermentation and chemical change in the albuminous constituents of the wood, is not improbably the immediate cause of dry rot, providing a soil suitable for the vegetation of fungi.

For the prevention of dry-rot, various processes have recently begun to be employed, the object of which is to fill the pores of the wood with some chemical substance, sir William Burnett used chloride of zinc; Mr. Bethell used creosote; and Mr. Payne, lime, with silicate of potash. The process most generally approved, and apparently most successful, is that of Kyan, called *Kyanizing* (q.v.), in which a solution of corrosive sublimate is introduced into the pores and cells of the timber by means of an air-pump. The salts of mercury have been found to be more unfavorable to the development of fungi than any other chemical substances.—But without the use of any such means, we have abundant evidence that well-seasoned timber, in favorable circumstances, may remain unassailed by fungi for many centuries. England contains structures of which the timber is known to be nearly 1000 years old; wood in a state of perfect preservation was brought by lord Elgin from behind the frieze of the Parthenon, where it must have been placed more than 2,000 years ago; and the British museum contains a block of charred wood found by Mr. Layard in his excavations at Nineveh.

DRY STOVE, in gardening, a hot-house in which the air is kept less moist than in the bark stove. In structure and in management, except that the temperature is kept higher, it agrees more nearly with the green-house. The dry stove is particularly adapted to succulent plants. As free an admission of air is allowed in the dry stove as is consistent with the maintenance of the temperature.

DRY TORTUGAS, the extreme south-western islets of the Florida Keys in the gulf of Mexico; 120 m. w.s.w. of the s. extremity of the mainland. They are of coral formation, low, and generally barren, though some are covered with mangrove bushes. Fort Jefferson, on one of them, was a penal station during the war of the rebellion. On the same island is a lighthouse. Pop. '70, 237.

DUAL, in grammar, is the form given in some languages to a noun or a verb, when only two things are spoken of. Thus, in Greek, *pater* is father; *patere*, two fathers; *pateres*, fathers. To have a dual number in addition to a plural is often spoken of as a refinement of language. It argues, however, a higher degree of abstraction to be able to conceive every subject as one, or more than one, than to require three classes—one, a pair, and more. Accordingly, it is only in some of the more ancient languages that we find traces of a dual number, and it becomes lost as the power grows of analyzing concrete impressions. Sanscrit, ancient Greek, Arabic, and Hebrew, have the dual number, the last only in nouns. Modern Greek has lost the dual. The only trace of it in Latin is in the two words *duo*, two, and *ambo*, both. It is wanting in the Germanic languages, with the exception of the ancient Gothic, which had a dual form of the verb. In Anglo-Saxon, there was a separate form of pronoun for "we two" (*wit*) and "ye two" (*git*).

DU'ALIN, an explosive preparation of nitro-glycerine and sawdust, intended to diminish the danger in the transportation and storage of nitro-glycerine.

DUALISM is the name given to a philosophical theory, according to which some two principles, of different nature, original, and incapable of being derived the one from the other, lie at the bottom of everything; as, for example, the ideal and the real, or the material and the thinking substance. In a narrower and theological sense, dualism means the assumption of two original beings, a good and an evil, as in the doctrine of Zoroaster, or of two distinct principles in man, a bodily and a spiritual. The opposite of dualism is monism.

DUANE, JAMES, 1733–97; b. N. Y.; a lawyer and a leader in the revolutionary war. He was a member of congress, 1774–77 and 1780–82; was the first mayor of New York after the revolution, and late in life was U. S. district judge.

DUANE, WILLIAM, 1760–1835; b. N. Y.; politician and journalist. He began journalism in India about 1784, but was sent back to England because of criticisms on the government, and his large fortune was confiscated. In London, he was for a time editor of the *General Advertiser*. In 1795, he came to Philadelphia and took the editorial chair of *The Aurora*, the organ of the Jeffersonian democracy, making it one of the most vigorously abusive journals in an abusive age. On one occasion he was mobbed and savagely beaten by a party of federalists. In 1822, he left the editorial chair and traveled in South America, and on return published an account of his wanderings. He served in the war of 1812. He wrote several works on military subjects.

DU BARRY, MARIE JEANNE GOMARD DE VAUBERNIER, Comtesse, favorite of Louis XV., was b. Aug. 19, 1746, at Vaucouleurs. Her mother was a dressmaker, and her father, or rather her reputed father, was an exciseman named Vaubernier. After the death of her father, she stayed for some time at a convent, but left it when fifteen years of age; went to Paris, and assuming the name of Mademoiselle Lange, succeeded in obtaining employment in the establishment of a fashionable milliner; but in a short time renounced all honest occupation, and forming a connection with a disreputable house, met there the comte Jean Du Barry, one of the most noted *roués* of his day, who made her his mistress. This person afterwards introduced her to Lebel, valet-de-chambre of Louis XV., who presented her to his royal master, then nearly 60 years of age. She was at this time remarkably handsome, to some extent witty, and had a frankness, or it might be, a vulgarity of manner that amused the doting monarch.

Desirous that *la petite Lange* should obtain a title, and be introduced to court, Louis prevailed upon comte Guillaume Du Barry, brother of the comte already mentioned, to marry, and thereby confer his title upon, the favorite. Accordingly, in 1769, she was presented to court as the comtesse Du Barry. After this period, many of the most powerful courtiers abased themselves before her. D'Aiguillon became her confidant, and in concert with her, ruled the doting king; the chancellor Maupeou claimed a remote relationship with her, and by her influence succeeded in dismissing and exiling the parliament in 1771; the abbé Terray, comptroller-general of finance, was *suave* to her, though insolent to all the rest of France. At no period, perhaps, was the court of France more openly and outrageously immoral than during the supremacy of this strumpet. On the death of Louis, however, in 1774, Du B. was dismissed from court, and sent to live in a convent near Meaux. She was afterwards removed to her residence of Luciennes, and while living there was allowed a pension by Louis XVI. Some time after the outbreak of the revolution, she went to London to dispose of her jewels. On her return, Robespierre caused her to be arrested, July, 1793. In Nov., she was tried before the revolutionary tribunal, and accused of "having wasted the treasures of the state, of conspiracy against the republic, and of having, in London, worn mourning for the late king." She was condemned to death, and was sent to the guillotine 7th Dec., 1793. Of all the women who mounted the scaffold during the revolution, Du B. exhibited the least courage. She implored the "good people" to deliver her, and Monsieur the executioner to prolong her miserable life for one moment only. The single good thing that history records of her, is her patronage of various artists and men of letters, but there is little reason to believe that it originated in anything higher than her dread of epigram and caricature. She had neither taste nor knowledge, and cared only for sensual gratifications and excitement. It is estimated that she cost France 35,000,000 francs. The *Mémoirs* published under her name (6 vols., Par. 1829–30) are not reliable. The only work, it seems, which can be consulted with confidence is Lacretelle's *Histoire de France pendant le* 18me *Siècle.*

DUBIT'ZA, a fortified t. of European Turkey, is situated on the northern frontier of Bosnia, on the right bank of the Unna, and at a point about 10 m. from its confluence with the Save, of which it is a tributary. During the 16th and 17th c., it was a bone of contention between Austria and the Porte, and was repeatedly lost and regained by the latter. It is chiefly notable, however, for its heroic but unavailing resistance to the Austrians in 1788. D. was subsequently restored to the Turks, to whom it now belongs. Pop. 6,000.—Over against Turkish D., on the opposite bank of the Unna, stands Austrian Dubitza, a strongly fortified market town in Austrian Croatia.

DUBLIN, a maritime co. in the e. of Leinster province, Ireland, and containing the metropolis of that country; bounded, n., by Meath; e., by the Irish sea; s., by Wicklow; and w., by Kildare and Meath. It is the smallest but two of the Irish counties, being 32 m. long, and 18 (average 12) broad; area, 354 sq.m., of which $\frac{8}{9}$ths are arable, and $\frac{1}{40}$th in wood. The coast, from its indentations with creeks and bays, is 70 m. long, and off it lie several isles. Dublin bay, one of the finest in the kingdom, is 6 m. broad, 6 deep, with a sweep of 16 miles. It has two precipitous hills, about 500 ft. high at its n. and s. ends; but the head of the bay is low and sandy. The coast is defended by 26 martello towers. The surface is mostly a level rich plain, with slight undulations, but rising in the s. in a hill-range, the highest point of which is Kippure, 2,473 feet. N. of this range, the only prominent eminences are Lambay isle, or Ireland's Eye, and Howth Head, 503 feet. The only river of note is the Liffey, which runs through Dublin city into Dublin bay. The Royal and Grand canals run w. through the co., and unite the Liffey and the Shannon. The chief rocks are carboniferous limestone, granite, and some metamorphic rocks and greenstone. There are copper and lead mines near Scalp. Fuller's-earth and potter's-clay occur. Iron and manganese are found on Howth peninsula. Granite and limestone are much used in building. There are many mineral springs, including 10 saline purgative ones, within the city of Dublin, and some tepid ones of 75° F. The climate is mild. The soil is generally a shallow calcareous gravelly clay. In the n. and w. are grazing and meadow farms, and around Dublin city, villas, kitchen-gardens, dairies, and nurseries. D. is the best cultivated co. in Ireland. In 1876, 90,283 acres, not very much under half the co., were in crop. The chief crops are oats (in 1876, 16,109 acres), wheat (5,646 acres), potatoes (9,863 acres). There are important fisheries along the coast of turbot, brill, sole, plaice, cod, ling, haddock, whiting, and oysters. The manufactures (chiefly of cottons, stockings, and embroidered muslins) are mostly confined to the city and the vicinity of the metropolis, and are of more value than in any other Irish county. Balbriggan is famed for its hosiery. The chief exports are from Dublin city. D. is divided into 9 baronies, and contains 76 civil parishes, and 10 parts of parishes. The chief towns are Dublin, the capital of Ireland, and Kingston. Pop. '71, exclusive of Dublin city, 160,000; including the city, 408,366. At the end of 1877, the co. had 53,232 pupils on the rolls of its national schools. The co. sends six members to parliament—two for D. co., two for Dublin city, and two for Dublin university. The manners, appearance, dress, and cabins of the lower orders in D. co. differ less from those of the interior of Ireland than would be expected. There are numerous antiquities in different parts of the county.

DUBLIN (Irish, *Dubh-linn*, "black pool;" the *Eblana* of Ptolemy), the capital of Ireland, stands on the river Liffey, where it disembogues into Dublin bay, in lat. 53° 20′ 38″ n., and long. 6° 17′ 30″ west. It covers an area of 1300 acres, but its parliamentary boundary comprises an area of about 5,000 acres, and its municipal boundary nearly 4,000 acres. Much of D. is built on land reclaimed from the sea, a work which still continues; and the ground is generally flat, with a very few undulations, scarce deserving the name of hill. The river, running from w. to e., divides the city into two almost equal portions. The aristocratic parts are the s.e. and n.e., containing many beautiful squares, with splendid streets and terraces. The center, and the n.w. quarter are the great emporiums of trade, and the residence of the middle classes, many of whom, however, have their private houses in the suburbs. The s.w. division, part of which is called the "Liberties," once the seat of the silk trade, is the most filthy and degraded portion of the city. The streets in this quarter are narrow, crooked, and irregular, while in the fashionable portions they possess a totally opposite character. The city is surrounded by a "circular road" of nearly 9 m. in length, forming a favorite drive and promenade.

In the newer parts of D., the streets run at right angles to one another, and are remarkable for their breadth and the uniformity of their architecture, which, however, is so varied as to avoid monotony. The most imposing one is Sackville street, which is 120 ft. broad, and nearly 700 yards long; at its n. end stands the rotunda, with Rutland square—in its center, the beautiful Ionic portico of the general post-office, and Nelson's monument (upwards of 130 ft. high)—while on the s., it is terminated by Carlisle bridge, and a wedge-like block of noble houses formed by the converging sides of Westmoreland and D'Olier streets. A peculiar feature of D. is its squares, which are very numerous, spacious, and well kept. Stephen's green, the largest, occupies an area of nearly 20 acres, and is about a mile in circuit. Somewhat smaller, but more elegant and aristocratic, is Merrion square (13 acres). The large park and squares of Trinity college occupy more than 40 acres.

The public buildings of D. are famed for their number and grandeur, and appear to more advantage since the dwelling-houses are built of brick. In the first class may be mentioned the bank of Ireland (formerly the house of parliament), Trinity college, the custom-house, and the four courts, which, from the chasteness of their design, and the massiveness of their proportions, have a very imposing effect. The castle has no pretensions to architectural beauty. There are monuments of William III. in College green (once a *green*, but now a paved street); of Nelson, the duke of Wellington, Goldsmith, Burke, Grattan, and many others in various public sites. The benevolent and charitable institutions of D. are very numerous, and are liberally supported.

Within the limits of the circular road, the Liffey is crossed by nine bridges (two of iron), and throughout the whole extent of the city the banks of the river are faced with granite walls and parapets. On each side of these "quays" there is a spacious roadway, with tall houses and excellent shops. The quay proper extends eastward from Carlisle bridge. Near the custom-house, there are several large docks for the accommodation of vessels from distant ports with excisable cargoes, and in communication with the Royal and Grand canals; the former connecting Dublin with the North Shannon and the w. of Ireland, the latter with the s. portion of the same river and the south. A very spacious dock, the "Spencer dock," was opened in 1873; and the harbor has been much improved in late years by the completion of two large breakwaters, the n. and s. walls. There is a bar at the mouth of the harbor, but even there the least depth at low tide is about 11 feet.

The chief manufacture of D. is poplin, which is much celebrated. This, with some glass-works, cotton and linen factories, foundries, distilleries, breweries, and those workshops which are necessary to supply domestic wants, are the main branches of industry. In this regard, D. has been much more of a capital, and less of a manufacturing and export city than London; but a considerable change in the industrial character of the city has been going on for several years. The direct foreign trade, though increasing, is very limited, Glasgow, Liverpool, and Bristol intercepting the greater portion of it. Much of the inland traffic is carried on by the canals above mentioned, and by the railways (now extending to all parts of Ireland), and consists principally of articles of dairy and farm produce from the central counties. The principal banks are the Bank of Ireland, the Royal, the National, Provincial, Hibernian, and Munster, with some private establishments.

The great educational institution of D. is Trinity college and university. See DUBLIN, UNIVERSITY OF. There is also a Catholic university, the medical school of which has been very successful. In regard to schools, D. is not well supplied. The education of the upper and middle classes is left chiefly to private enterprise. For the humbler classes, much has been done by the national board (whose model schools are attended by large numbers of children), by the church education society, the Christian brothers, and Catholic brotherhoods and sisterhoods, and other agencies. There are many literary and scientific societies, dealing with subjects of general knowledge, or with matters of local or national interest. There are two botanic gardens—one at Glasnevin, belonging to the royal Dublin society, and one near Donnybrook, connected with the university. The hospitals, asylums, orphanages, and other charitable institutions are numerous, and liberally maintained.

The municipal affairs are under the control of a town-council, which consists of a lord mayor, 15 aldermen, and 45 councilors. The revenue which they derive from rents, customs, and other sources, was, in 1874–75, £286,804. There is a large police force, which has charge of the city and of all the surrounding country as far as 8 m. from the castle. The city sends two members to parliament. The population of the municipal borough in 1871 was 246,326, of whom 195,180 were Roman Catholics, 39,897 Episcopalians, 4,517 Presbyterians, and the rest of other denominations; of parl. bor. 267,717.

The environs of D. are especially beautiful. Rathmines, a southern suburb, has become a large township, and is the favorite residence of the wealthier part of the mercantile community. Glasnevin, on the n., deserves special notice as the favorite residence of the poet Tickell, of Addison, Steele, Parnell, Swift, Sheridan, and many other celebrated men. In the cemetery at Glasnevin lie the remains of Curran, O'Connell, and Tom Steele. The Phœnix park is a magnificent area of nearly 2,000 acres, in some parts level, in others with broken ground, having a large amount of timber and brushwood, which shelter immense herds of deer. It affords ample scope for military reviews, and is most extensively used by the inhabitants of D. of all classes for recreation. D., as a whole, with its magnificent bay—which has often been compared to the bay of Naples—splendid park, massive public buildings, wide streets, spacious and well-kept squares, clean and elegant quays, and beautiful environs, is one of the most handsome and delightful capitals of Europe.

There are numerous places of worship, Catholic and Protestant, monasteries, convents, friaries, and a Jewish synagogue. The most remarkable among the Protestant churches are St. Patrick's cathedral, restored by the munificence of a single individual, and Christ church, which has also undergone restoration; and among the Catholic, St Mary's, St. Saviour's, St. Augustine's, St. Kivin's.

The number of vessels entered inwards in the port of D. was, in 1875, 7,216, with a tonnage of 1,677,552; cleared outwards, 3,749, with a tonnage of 1,150,256. The customs revenue in 1874 was £1,064,580.

DUBLIN, UNIVERSITY OF. The first university of Dublin was established in connection with St. Patrick's cathedral in 1320; but for want of proper endowments, it never prospered, and dragged out a miserable existence till, probably, the dissolution of the cathedral by Henry VIII.

Foundation.—The existing university was founded in 1591–92, and stands in the position of being a college with university powers. Trinity college, indeed, was intended merely as the *nucleus* of a university, but as no colleges have since been added, it remains in undisputed possession of all university privileges. Queen Elizabeth provided the charter, the corporation of Dublin bestowed the ground and ruins of the suppressed monastary of All-Hallows, and the Irish gentry supplied by subscription the funds necessary for the erection of the buildings. The income of the college was very limited and very precarious, till James I. endowed it with certain estates in the province of Ulster, and a yearly pension of £388 15*s.*, English money, from the public purse.

Constitution.—By queen Elizabeth's charter, the corporation was to consist of a provost, three fellows, and three scholars, in the name of more, with the power of purchasing, taking, and possessing any manors, tenements, etc., from the sovereign, or from any other person. On a vacancy in the provostship, the fellows were entitled to elect a fit successor, and the election of fellows and scholars lay with the provost and fellows. The provost and fellows had full powers to enact statutes, confer degrees, and prescribe the necessary exercises for graduation, and to do all the work of tuition. Defects soon began to show themselves in this constitution, but they were remedied by the new statutes of archbishop Laud, which were definitely published in 1637, and which are in the main still in force. By these the election of provost was given to the crown.

Parliamentary Representation.—In 1613, James I. conferred on the university the right of sending two members to the Irish parliament. One of these was taken away at the union in 1800, but was again restored by the reform bill of 1832. The electors were formerly the provost, fellows, and scholars; but, in 1832, the privilege was extended to masters of arts, and those of higher degree.

Board.—The provost and senior fellows form the board of management of the college. They meet every Saturday, and transact all the financial and other business.

Council.—By letters-patent of 1874, a council was established to co-operate with the board in the regulation of the studies of the university, and in the appointment and regulation of the tenure of office and duties of professors. This council consists of 17 members—namely, the provost of Trinity college, 4 members elected by the senior fellows, 4 elected by the junior fellows, 4 by the professors, and 4 by the senate of the university.

Officers.—The government and working of the university are intrusted to the following officers: the chancellor, vice-chancellor, provost, two proctors (one chosen from the senior, and one from the junior fellows), a senior lecturer (who regulates the public examinations), two deans, and a censor, a librarian, registrars, an auditor, professors, and examiners.

Senate.—The chancellor (or, in his absence, the vice-chancellor or *pro* vice-chancellor), all masters of arts, and doctors of the three faculties, whose names are on the college books, form the senate of the university. The senate elects the chancellor, and confers degrees.

Caput.—The caput of the senate consists of the chancellor, vice-chancellor, provost (or vice-provost), and senior master *non-regent*, who is chosen by the senate. Every *grace* (for the bestowal of a degree) must first receive the sanction of the provost and senior fellows, be afterwards approved of by the caput (each member of which has a *negative* vote), and finally be confirmed by the senate in public congregation.

Provost.—The provost, who is appointed by the crown, may be a layman, of any religious denomination. He enjoys an income of about £3,000 a year.

Fellows (*Senior*).—The fellows are all chosen, in the first instance, by examination; but the seniors are promoted from the juniors, in order of seniority. They have no stated duties, except those connected with the general management of the college affairs. The average income of a senior fellow, from all sources, is about £1380 per annum.

Fellows (*Junior*).—The junior fellows are elected by examination. They form the great teaching staff of the college, and do all the duties of lecturing and examining the undergraduates. Most of them are tutors, and their income, which may average £600 a year, is derived partly from a salary given by the college, and partly from their duties as tutors, lecturers, and examiners. Fellowships were formerly tenable only by members of the Episcopal church, but by the recent act all such religious restrictions were abolished. The number of the junior fellows has been altered from time to time, but by a queen's letter, issued some years ago, it was fixed at 23—the then number of 27 being gradually reducible. The law of celibacy, imposed in the reign of Charles I., was repealed in 1840.

Professors.—There is a very complete staff of professors, who represent almost all subjects of human knowledge. Besides a full complement of lecturers in divinity, natural philosophy, mathematics, law, and medicine, there are professors of ancient, oriental, and modern languages (Irish, Arabic, and Sanscrit being among the number), moral philosophy, oratory and English literature, modern history, political economy, natural history, botany, geology, mineralogy, civil engineering, etc.

Scholars.—The scholars, 70 in number, are elected from among the undergraduates. They are members of the corporation, and have the university franchise. Scholarships (which are tenable for five years) are gained by public competition—some being assigned for classics, and others for science; the provost and senior fellows, assisted by some of the junior fellows or professors, if desired, are the examiners. The various emoluments of a scholar, arising from salary, remission of fees, rooms, commons, etc., amount to about £50 per annum. There are also minor scholarships for the encouragement of the study of divinity and of the Irish language; while others are connected with the royal and endowed schools. Forty exhibitions of £25 per annum each, tenable for two years, have been recently founded, 12 of which are given in each year to students immediately after entrance, and 8 to those who have concluded their second year.

Students.—There are four grades of students. 1. Noblemen, sons of noblemen, and baronets, who have certain special privileges; the first two being allowed the degree of B.A. *per specialem gratiam*. 2. Fellow-commoners, who dine at the fellows' table. 3. Pensioners, who form the great body of the students. 4. Sizars, who have rooms and commons free. The sizars are limited to 30; they are elected by competitive examination, and hold their sizarships (worth about £37 per annum) for four years. Each rank has a dress peculiar to itself.

Entrance.—Students are admitted to the college after an examination in a prescribed course of classics, arithmetic and algebra, English history and composition, and modern geography. The honor of *first place* at entrance examination is keenly contested; and there are, besides, prizes awarded for excellence in special branches of the entrance course, and also for Hebrew.

Tutors.—Each student must at entrance place himself under one of the 18 junior fellows who are tutors. These stand to their pupils *in loco parentis*, and have charge of their tuition, though each tutor does not necessarily teach his own pupils.

System.—To proceed to the degree of A.B., a student must keep terms for four years, two terms at least being necessary in each year. Terms may be kept either by residence, and attendance on lectures, or by simply appearing on a stated day in the public hall, and passing a creditable examination in a prescribed course. Lectures are delivered on the different subjects of each term examination by the tutors, the honor examiners, and the university professors; and prizes of the value of £4 and £2 are awarded at the Michaelmas examination to the *first* and the *second* honor men respectively. In the other terms (Hilary and Trinity), parchment certificates reward the diligent. At the end of the fourth year, gold and silver medals are awarded to the senior and junior moderators. Students of the first year are called junior freshmen; those of the second, senior freshmen; of the third, junior sophisters; and of the fourth, senior sophisters. All students must pursue the following course: *first year*, Latin, Greek, mathematics; *second year*, Latin, Greek, mathematics, logic, and metaphysics; *third year*, Latin, Greek, physics, logic, and metaphysics; *fourth year*, Latin, Greek,

physics (both mathematical and experimental), astronomy, and ethics. For those who aspire to honors, the course is much more extensive than that for mere *pass*.

Degrees.—Term examinations having been duly passed, the student is promoted to the degree of A.B., which is conferred by the senate in full congregation. The *comitia* for granting degrees are held on Shrove Tuesday and the last Wednesday in Trinity and Michaelmas terms. Those students who, at the final ordeal of the fourth year, stand highest in an examination over an extra course in (1) mathematics and mathematical physics; (2) classics; (3) mental and moral philosophy; (4) experimental science; (5) natural science; (6) history and political science; (7) modern literature, are called (according to merit) senior or junior moderators. These form the first class of graduates, the second being called respondents. The third consists of "unclassed candidates." The higher degrees are procurable after the lapse of a fixed number of years, and on the performance of certain exercises, and the payment of fees.

Fees.—For entrance and first half-year the fees are—Noblemen, £60; fellow-commoner, £30; pensioner, £15; sizar, £5 1*s.* 3*d.* Other half-years, £33 12*s.*, £16 16*s.*, and £8 8*s.*—the sizars being exempt. This does not include rooms and commons. For degrees, the fees for pensioners are—A.B., £8 17*s.* 6*d.*; A.M., £9 16*s.* 6*d.*; LL.B., £11 15*s.*; LL.D., £22; B.D., £13 15*s.*; D.D., £26; M.B., £11 15*s.*; M.D., £22

Divinity, Medical, and Engineering Schools.—Connected with Trinity college there are schools for medicine and engineering. The Divinity school of the church of Ireland is also in connection with the university. Graduates in medicine and in engineering must previously graduate in arts. The divinity testimonium is obtained after two years' attendance on lectures, with an examination at the end of each term.

Church Patronage.—The university formerly held a large and valuable patronage, but this has been abolished by the recent church act.

Studentships.—In 1859, 14 studentships were founded, worth £100 a year each, tenable for seven years, to encourage graduates in the pursuit of some special branch of study which they may afterwards be called on to teach, should they become fellows and lecturers. Two are given every year, and (like every other prize or distinction in the university, not connected with the divinity school) are open to persons of all religious denominations. They are awarded to those candidates at the degree examination who take the highest places in science and classics respectively.

General Remarks.—The university of Dublin is well equipped for carrying education to a high degree of perfection. The teaching staff is numerous, and in the actual work of tuition, the tutorial and professorial elements are more largely combined than in any other British university. Many distinguished men have, in past generations, gone forth from her halls. The names of Ussher and Berkeley; of Elrington, Lloyd, Magee, sir W. Hamilton, Romney Robinson, Maccullagh, Archer Butler, lord Cairns; and of Burke, Sheridan, Curran, Swift, and Goldsmith, with a host of others celebrated in politics, in law, in science, and in literature, are sufficient to indicate the success which has attended her sons.

DUBNIT'ZA, a t. in the principality of Bulgaria, 25 m. s.w. of Sophia. It has extensive iron-works, and a pop. of about 6,000.

DUB'NO, a t. in Russia, in the government of Volhynia. Its trade is chiefly in corn, flax, tobacco, fish, and cattle. A large fair is also held here at Whitsuntide. Pop. '67, 7,628.

DUBOIS', a co. in s.w. Indiana, bounded on the n. by White river, and having railroad connection with the Ohio; 420 sq.m.; pop. '70, 12,597. It has a varied surface, with much forest land; good soil, and abundant coal. Chief productions, wheat, corn, and tobacco. Co. seat, Jasper.

DUBOIS, ANTOINE, Baron, 1756–1837; a French surgeon; in 1790, professor in the royal college of surgery; one of the savants selected by Bonaparte to accompany the expedition to Egypt. It is said that at the accouchement of the empress (Marie Louise) his skill saved the lives of both mother and child. He was surgeon-in-chief of the hospital still known by his name. His publications were few, but he devised many new processes, and invented several new instruments.

DUBOIS, GUILLAUME, Cardinal, was b. 6th Sept., 1656, at Brives-la-Gaillarde, in Auvergne, where his father was an apothecary. At the age of 12, he came to Paris, and entered the college of Saint Michel, as a domestic of the principal. Here he made such good use of his opportunies for acquiring knowledge, that he was afterwards selected as tutor to the son of a merchant named Mauroy, and gradually rose till he became tutor to the young duc de Chartres. Although of an ugly exterior, he contrived, by his mixture of wit and hypocrisy, to win the esteem of the boy's mother, while he possessed the most unlimited confidence of his pupil, partly through their common love of letters, and partly because he took upon himself the odious office of pander to his vices. His public career commenced after the marriage of his pupil, in 1692, with Mademoiselle Blois, a natural but legitimatized daughter of Louis XIV. He then received from that monarch, for his services in bringing about the match, a gift of the abbey of St. Just, in Picardy. He was next attached to the French embassy at the court of London, where he formed some important political connections. On his return, he became pri-

vate secretary to his old pupil; and when the latter (now duke of Orleans) became regent in 1715, D. became virtually the most powerful man in France. The great act of his life was the famous treaty signed at La Haye, 14th Jan., 1717, and known as the *triple alliance*, between England, Holland, and France. The importance of this act lies in the circumstance that it effectually changed the foreign policy of France, in spite of the French princes, in spite of the traditions of Louis XIV., in spite of the dislike of the English king for the regent, and finally, in spite of cardinal Alberoni himself, the Spanish minister. In reward for his brilliant dexterity, D. received the office of minister of foreign affairs, and in 1720, on the solicitation of George I. of England, was appointed to the vacant archbishopric of Cambray. In 1721, he obtained the cardinal's hat, and in the following year became prime minister of France, when his authority seemed unbounded. He died 10th Aug., 1723, a victim to hard work and the wildest debauchery.

DUBOIS, JEAN ANTOINE, 1765–1848; a French missionary in the East Indies, where he passed 32 years; author of *Letters on the State of Christianity in India*. He also contributed to the *Bulletin des Sciences*, and the journals of the Asiatic societies. His best known work was *Description of the Character, Manners, and Customs of the People of India, and of their Institutions, religious and civil*, which was published in English by the East India company, and subsequently in French at Paris.

DU BOIS-REYMOND, EMIL HEINRICH, b. 1818; a German scientist; member and perpetual secretary of the imperial academy at Berlin, imperial privy councilor, professor of physiology in the university of Berlin, and director of the physiological apparatus and of the physiological laboratory. He has made many important researches in animal electricity, and published invaluable works on that theme, and on recent progress in anatomy and physiology.

DUBOSSA'RI, or NOVIE DUBOSSARI, a t. in the government of Kherson, European Russia, on the Dniester, 101 m. above Odessa; pop. about 8,000. It is in a picturesque situation, surrounded with fertile fields and gardens, and has a number of important public institutions. Trade is chiefly in wine, tobacco, cattle, and grain.

DUBOV'KA, a t. of European Russia, in the government of Saratov, is situated on the eastern slope of the Sarpa hills, on the right bank of the Volga, in lat. about 49° n., and long. 44° 45' east. It is a depot for goods brought from the northern provinces, which it forwards to Katschalinskala, a town about 40 m. distant from D., and situated on the Don. The produce is thence conveyed by the Don to the southern provinces. D. has some trade in wood, oil, iron, and manufactured articles. Pop. '67, 13,676.

DUBS, JAKOB, b. 1822; a Swiss politician; studied law at Heidelberg, Bern, and Zurich; in 1847, he was elected to the grand council; afterwards to other offices in his native canton. In 1857, he was president of the federal court; and, 1864 and 1870, president of the confederation. In politics he is a liberal, and has promoted many reforms. He is the author of a number of political works.

DUBUFE, ÉDOUARD, b. Paris, 1818; studied under his father, Claude Marie, and Paul Delaroche. He successfully followed his father's sentimental style, but afterwards painted Scriptural subjects. His later work has been chiefly in portraits, among them the empress Eugenie, Rosa Bonheur, and the members of the congress of Paris. Three of his large compositions have been exhibited in the United States—"The Prodigal Son," "The Conscript's Departure," and "The Soldier's Return."

DUBUQUE, a co. in e. Iowa, on the Mississippi river, watered by branches of the Maquoketa, crossed by the Dubuque and Pacific railroad; 625 sq.m.; pop. '75, 43,845. It is hilly and well timbered, with fertile soil, producing wheat, corn, butter, etc. There is abundance of lead ore, and more than 100 mines are in operation. Co. seat, Dubuque.

DUBUQUE, a city and port of Iowa, U. S., on the right bank of the Mississippi, 450 m. above St. Louis, built on a bluff 200 ft. high, contains a city hall, market-house, U. S. custom-house, Episcopal seminary, surveyor-general's office, 14 Protestant and three Catholic churches and cathedral, eight newspapers, of which two are German. Settled in 1788, by Julian Dubuque, a French trader, it became the center of a large trade, and is the chief depot of the great lead region of Illinois, Wisconsin, and Iowa. Pop. '60, 13,012; '70, 18,434.

DUBUQUE (*ante.*), a city in Dubuque co., Iowa, picturesquely situated on a low terrace and on high bluffs on the w. bank of the Mississippi river, 155 m. w. of Chicago; pop. '75, 23,605. It is the center of an important railroad system; and the river is here crossed by an iron railway bridge to Dunleith, Ill. Dubuque is a port of entry, and has a collector and a custom-house, and is the most important center of trade in the lead region. Its annual export of lead, taken from the mines near the city, is from 10,000,000 to 20,000,000 lbs. The river commerce in produce and manufactures is also large, the country around being an excellent agricultural region. There are several fine churches. The Roman Catholics and the Episcopalians have bishops in the city. Of educational institutions there are St. Joseph's college and academy, and St. Mary's academy, both Roman Catholic, and several schools under control of the same denomination. Besides

these there are the Iowa institute of science and art, a German Presbyterian divinity school, and manufactories for farming tools, engines, machinery, leather, bricks, lead, flour, soap, etc. The place was named from Julien Dubuque, a French Canadian, who settled on the spot in 1778, with permission from the Spanish government to carry on mining. The permanent settlement was in 1833; town incorporated 1837; chartered as a city 1840.

DUCANGE. See DUFRESNE.

DU'CAS, MICHAEL, lived about the middle of the 15th c.; a Greek historian, of a family that gave several emperors to Constantinople. After the fall of that city he was employed in diplomatic business. He wrote a history beginning at the death of John Palæologus and extending to the capture of Lesbos in 1462, which is a valuable source of information concerning the close of the Greek empire.

DUC'AT, one of the most extensively used names for a coin, mostly of gold. Ducats were first coined in the 12th c. in Sicily, and took their name from the legend found on those early Sicilian pieces: *Sit tibi, Christe, datus, quem tu regis, iste Ducatus* (*ducatus* means duchy). Such coins were extensively issued after the 12th c. in Italy, especially at Venice. Venice ducats were called *Zecchini*, from *Zecca*, where the mint was situated. The ducat was adopted in 1559 by the imperial diet of Germany into the currency of the empire, and was afterwards coined in the several German states, and over the whole of the north of the European continent, Russia included. They generally bore the likenesses of the sovereign princes. The ducat varied in weight and fineness; by far the most common, which was current in Austria, Russia, Hamburg, etc., weighed 54 troy grains, sterling value about 9*s.* 4*d.* The modern Italian ducat was of much less value. The gold ducat of Venice was valued at 6*s.* In the (late) kingdom of the Two Sicilies, the ducat (ducato del regno) was a silver coin and money of account, forming the unit of the currency, being divided into 100 grani, in the island of Sicily into 100 bajocchi. There are few silver ducats, however, in existence. The ducat = 3*s.* 4*d.* sterling. There are various kinds of the Spanish *ducado*, generally translated dollar. The ducado de plata, or silver ducat, hard = 4*s.* 2*d.* The ducat is now, to a great extent, merely a money of exchange.

DUCA'TO, CAPE (anciently *Leuca'tés*), a headland at the southern extremity of a promontory of Santa Maura, one of the Ionian island, in lat. 38° 34′ n., and long. 20° 32′ east. Cape D. was in ancient times dreaded by mariners, and the modern Greek sailor still fears the strong currents and the fierce gales which he has to encounter there. A point on the western side of the *Leucadian* promontory is called *Sappho's Leap*, as it was supposed that here the poetess precipitated herself into the sea. It is a white, broken cliff, rising perpendicularly from the water to the height of about 2,000 feet. On its summit stood a temple dedicated to Apollo, the substructure of which still exists.

DU CHAILLU, PAUL BELLONI, a distinguished traveler, was b. in the s. of France, about 1820. His father was for many years a merchant trading on the Gaboon (q.v.) river, in western Africa, and thither he was carried when a boy. He lived there for several years, and became familiar with the habits and languages of the natives, thus—as well as in his habituation to the climate—unconsciously preparing himself for the explorations which he was afterwards to undertake. In 1842, the French made a settlement and built a fort on the Gaboon. Under the protection of this fort, both the elder and younger Du C. resided and carried on their commercial pursuits for some years. Du C. afterwards went to America, where he resided for a number of years, and was naturalized by the legislature of the state of New York. In Oct., 1855, he sailed from New York to w. Africa, where he spent four years in explorations, making many interesting discoveries, and traveling, as he himself tells us, about 8,000 miles, always on foot, and unaccompanied by other white men. He returned to America, and after subjecting his specimens in natural history and ethnological notes to the examination of the scientific men of New York and Boston, he crossed the Atlantic to England, and published a volume of travels—*Explorations and Adventures in Equatorial Africa, with Accounts of the Manners and Customs of the People, and of the Chase of the Gorilla, Crocodile, Leopard, Elephant, and other Animals* (Lond. 1861). His travels were in a region lying between n. lat. 1° 30′, and s. lat. 2°, and extending from the coast to about e. long. 14° 15′; and the work in which he gives an account of them contains very important contributions to geographical, ethnological, and zoological science. Under the first of these heads must be ranked, as of chief importance, the information concerning the Fernand Vas, Ogobai, and Rembo rivers (see OGOBAI, or OGOWÉ), and concerning the mountain chain which, between the equator and s. lat 1°, stretches from w. to e. from the neighborhood of the coast far into the interior of Africa. He made known the existence and described the characteristics and habits of a number of African tribes, among which particular interest attached to his account of the Fans (q.v.), a cannibal tribe, inhabiting a region on the western side of the coast-range of mountains, just to the n. of the equator. His contributions to zoology related not only to the gorilla and other remarkable apes, some of them previously quite unknown, but included also many new species of mammals and birds. Many of the statements contained in his volume, however, being very extraordinary, it was received with much distrust, and was

subjected to very adverse criticism; to which it was the more exposed because the author's journals having been put into the hands of a literary gentleman in America to be prepared for the press, separate journeys were mixed up in the narrative, and the chronology was thrown into confusion. Much discussion took place in newspapers and periodicals, and some writers went so far as to assert their belief that Du C.'s stories about the gorilla were entirely fabulous, and that he had never seen the animal alive, but had purchased the specimens which he brought to England from natives on the coast. His descriptions of nest-building apes were, of course, also received with incredulity, and the truth of his account of the cannibal Fans was much doubted. The maps drawn up by Dr. Barth and Dr. Petermann in 1862 moved the positions of all the places which he had visited much nearer the coast than he had fixed them, so as greatly to reduce the length of his routes. The general trustworthiness of Du C.'s narrative was, however, maintained by some men of the highest eminence, and particularly by sir Roderick Murchison and Dr. Owen. Du C. resolved to confute his opponents, and vindicate his own reputation, by another expedition to Africa, for which he prepared himself by a course of scientific study, to enable him to make astronomical and other observations, and by acquiring the art of photography. During his first explorations, he had laid down the position of places from compass-bearings only. The substantial accuracy of his observations was, however, in the meantime confirmed by a French government expedition under Messrs. Serval and Griffon du Bellay, which explored the Ogobai river in 1862; and Dr. Petermann then reconstructed his map of that part of Africa as Du C. had originally laid it down. His statements regarding the cannibalism of the Fans were also confirmed by capt. Burton, who himself traveled among them. Du C., however, proceeded on his second expedition. He freighted a small schooner, and sailed in her from England on 6th Aug., 1863, carrying with him not only an ample store of scientific apparatus, but also of goods for presents to the natives, or barter with them. He reached the mouth of the Fernand Vas river on 10th Oct., and was warmly welcomed by the African chiefs whom he had formerly known; but he sustained a grievous misfortune in the loss of all his scientific instruments and many other valuable articles, through the swamping of the canoe by the surf, as they were being landed from the schooner. He was compelled to send to England for another set of instruments, and to wait till they arrived. Meanwhile, he made several excursions in the neighborhood of the coast, through the almost impenetrable jungle which covers the western coast regions of equatorial Africa, and had abundant opportunity of confirming his former observations regarding the gorilla. He also had live ones caught and brought to him by the natives. In Sept., 1864, Du C. having received his new supply of instruments from England, started on his expedition for the exploration of the interior. He was attended by a body-guard of ten Commi negroes, in thick canvas trousers, blue woolen shirts, and worsted caps, each man having a blanket to keep him warm at night. There was difficulty, however, in getting leave to set out on the expedition at all. It is the universal rule among the coast tribes of w. Africa to prevent, if possible, all strangers from penetrating into the interior, even if it be only to the next tribe, through fear that the exclusive privilege of trading with that tribe should be lost. A grand *palaver* was held on the subject, and it was at last agreed that Du C. should be allowed, as a special favor, to ascend the Fernand Vas or Ogobai, as his object was not to trade, but to shoot animals, and to bring away the skins and bones. "Truly," the chiefs and councilors said, "we do not know what Chaillie has in his stomach to want such things, but we must let him go." Du C. revisited some of the scenes of his former explorations—the Ogobai, the Rembo, and their branches. He suffered great hardships, being sometimes at a loss even for food, and his attendants being almost all at one time ill of small-pox, which made fearful havoc among the native population, and exposed him to the dangerous suspicion of having caused it by witchcraft. He passed through a forest district so dense that animal life is scarcely found in it, and an almost unbroken silence prevails by day and by night. He found also in his journeyings many scenes of extreme beauty, scenes of mountain and meadow, hill and pasture-land, groves of plantains, groves of lime-trees remarkable for dark foliage, stately palms, and clear sparkling streams. An unfortunate misunderstanding took place at last between Du C.'s party and the inhabitants of a village which he had reached. A conflict took place, the natives became exasperated, and it was with difficulty that the traveler escaped, being obliged, however, to resign all thought of proceeding further. He reached the mouth of the Fernand Vas river on 21st of Sept., 1865, and found a vessel there loading for London. He had lost everything but his journals; all the treasures in natural history which he had collected were gone. He brought home, however, his astronomical observations, which have been carefully examined by the most competent persons, and the map of western equatorial Africa has been made much more complete and correct than before. Du C. did not penetrate, on any of his journeys, much more than 240 m. in a direct line from the coast, but his discoveries have been numerous and important, and amongst them are about eighty new species of mammals and birds. No one now doubts the right of Du C. to be ranked among the most enterprising and truthful of travelers. The account of his second expedition to Africa is entitled *A Journey to Ashango-Land* (Lond. 1867). His ethnographical observations were published in *My Apingi Kingdom* (1870); and *The Country of the Dwarfs* (1872).

DU CHAILLU, PAUL BELLONI, b. Paris, 1835; son of a trader to the w. coast of Africa, where the boy passed some time at an early age, and acquired knowledge of the language and modes of life of the neighboring tribes, and of natural history. In 1852, he traveled through the United States, and published a series of papers on the Gaboon country. In Oct., 1855, he left New York to explore equatorial Africa, and spent nearly four years in the work, reaching to about 14° 15′ east. During this trip he shot and stuffed more than 2,000 birds, of which 60 were species before unknown. He also killed more than 1000 animals, among them several gorillas, a species probably never before seen by Europeans. In 1859, he returned to the United States with his natural history specimens and a great collection of arms and domestic implements. He published an account of his trip in *Explorations and Adventures in Equatorial Africa.* I was one of the first to describe the gorilla; and the truth of his narrative was strongly attacked, and as stoutly defended, mainly by English savants. This provoked the traveler to undertake a second journey, and he sailed from England for that purpose in Aug., 1863. He went over much of his course on his first trip, but explored some new regions. In Sept., 1865, he was compelled to return to the coast in consequence of the hostility of the natives, having lost everything except his journals. This venture was detailed in *A Journey to Ashango Land.* He lectured in the United States, where he fixed his residence, and in 1872–73, made a trip in Norway, Lapland, Sweden, and Finland. Besides the works named he has published *The Gorilla Country; Wild Life; Lost in the Jungle; My Apingi Kingdom;* and the *Country of the Dwarfs.*

DU CHÂTELET. See CHÂTELET LOMONT, *ante.*

DUCHÉ, JACOB, D.D., 1739–98; b. Philadelphia; graduate of the college of that city in 1757, completing his education at Cambridge, Eng. In 1775, he was rector of Christ church in Philadelphia. The next year he was chaplain to the first continental congress, and gave all his salary for the relief of the families of soldiers killed in the war. His courage gave out on the capture of Philadelphia by the British, 1777, and he wrote to Washington urging him to cease what seemed to be a hopeless struggle. The letter was laid before congress, and Duché fled to England, and his property was confiscated. He returned in 1790, but could not regain position or influence.

DUCHESNE, ANDRÉ (in Latin, Andreas Chesnius, or Duchenius, or Quercetanus), the father of French history, was b. at Ile-Bouchard, in the old province of Touraine, in May, 1584, and studied at Loudun and Paris. History and geography were his favorite studies from his youth, and under Richelieu's ministry he was appointed royal geographer and historiographer. He d. 30th May, 1640, by a sad accident, having been crushed against a wall by a carriage in a narrow street. His collection of the *Historiæ Francorum Scriptores Coætanei ab ipsius gentis origine ad Philippi IV. tempora* (5 vols., Paris, 1636–49), is particularly important. It was continued from the third volume by his son, FRANÇOIS DUCHESNE (born 1616, died, after having likewise been appointed historiographer, in 1693), and contains much that may be sought for in vain in Bouquet's collection. Of his other numerous writings, we may mention, as deserving of special notice, the *Historiæ Normannorum Scriptores Antiqui* (Paris, 1619); *Histoire Généalogique de la Maison de Montmorency et de Laval* (Paris, 1624); and *Histoire Généalogique de la Maison de Vergi* (Paris, 1625). The last two throw much light upon the history of France. D.'s industry was extraordinary; he is said to have left more than a hundred folios in manuscript.

DUCHOBORTZI, a Russian religious sect, of the origin of which nothing is very certainly known, and which, although conjecturally referred by count Krasinski to the Patarenes (see CATHARI), cannot be traced beyond the middle of the 18th c., when it was found to exist in different parts of Russia; and its members became exposed to penalties by their refusal to serve in the army. The D. hold the doctrine of the Trinity, and are chiefly distinguished by their holding that human souls existed before the creation of the world, and fell in that former existence, from which the fall of Adam and a continual tendency to fall have proceeded; and by their ascribing hidden mysterious meanings to all parts of the Bible, for the knowledge of which they depend on inward light. They are extreme mystics. They reject the use of pictures common in the Russian Greek church. They neither observe baptism nor the Lord's supper. In their religious meetings they salute each other with bows and kisses: they pray, sing psalms, and exhort or expound the Scriptures. They are, however, generally very illiterate and ignorant. On the accession of the emperor Alexander I., they received the most complete toleration, and were allowed to settle by themselves on the bank of the Molochna in the s. of Russia. Here, however, an impostor named Kapustin prevailed on them to receive him as a prophet, taught them the transmigration of souls, and made them believe that he himself was animated by the soul of Jesus Christ; and it would appear that, in consequence of disputes arising among them concerning him, great numbers were buried alive, and otherwise put to death by the rest, on which the settlements on the Molochna were broken up in 1841, and great part of the people transferred to the provinces beyond the Caucasus.

DUCK, a kind of plain linen of a coarse, heavy make, highly glazed, used for smock-frocks by the English agricultural laborers, and for working-dresses by those employed at smelting furnaces and iron [illegible]

DUCK. See ANAS. The broader bill, laminated and not toothed, distinguishes the Linnæan genus *anas* from *mergus* (including smews, mergansers, and the goosander). In recent ornithological systems, however, it is divided into numerous genera, but three chief groups are usually recognized, corresponding to swans, geese, and ducks of popular nomenclature. See GOOSE and SWAN. The group to which the name D. is sometimes extended, both by scientific writers and in popular language, is characterized by greater breadth of bill than either the swans or geese. Their food is chiefly animal, whilst that of both swans and geese is in great part vegetable. Their legs are shorter and placed further backward than those of geese, so that they move with greater difficulty and with a more waddling gait on land, and their necks are shorter than those of geese, and much shorter than those of swans, although in this character there is a considerable difference between different species. There is a very marked difference in plumage between the males and females, which is not the case in any corresponding degree in swans and geese. They exhibit also a peculiar anatomical character in a large dilation of their trachea (windpipe) on each side at its bifurcation. This great group of ducks is subdivided into two sections; one section characterized by a webbed or broadly margined hind-toe, the other by a hind-toe destitute of membrane. These characters are connected with important differences in other respects, and particularly in habits; the ducks of the first section being chiefly oceanic, living more exclusively on animal food, and diving readily and frequently in pursuit of it; whilst those of the second section are more generally inhabitants of lakes and other inland waters, showing a preference for shallow waters. Those of the first section also have the feet placed further backward than those of the second; those of the second have generally longer wings than those of the first, and a longer neck by which they are adapted for seeking their food by dabbling in muddy shallows, they less frequently dive, and when alarmed, generally seek safety by taking wing. Many of both sections are migratory, and spend the summer in arctic and sub-arctic regions. Not a few of them are common to the northern parts of both the eastern and western continents. Their plumage is remarkably thick, soft, and compact. The tongue, which, unlike that of most birds, is large and fleshy, assists in the selection of food. To the first or oceanic section of ducks belong scoters, garrots, eiders, pochards, scaups, harelds, etc.; to the second section belong shieldrakes, shovelers, musk ducks, summer D., pintails, gadwalls, teals, wigeons, bluewings, etc.—See these articles.

The COMMON DUCK, or DOMESTIC DUCK (*anas boschas*), known also in its wild state as the WILD DUCK or MALLARD, belongs to a genus, or sub-genus, of the second section, characterized by a flattish broad bill, longer than the head, not contracted, nor much dilated, towards the tip, and not much elevated at the base, destitute of tubercle at the base, the denticulations of the upper mandible (ends of the laminæ) scarcely projecting beyond the margin, and a short and rather pointed tail of 16 feathers. Even as thus characterized, it includes teals (q.v.), which are by some ornithologists constituted into a separate genus. The male (drake) of the common D. has the four middle tail-feathers recurved. The deep emerald green of the head and upper part of the neck, the white collar which separates the green from the dark chestnut of the lower part of the neck, and the deep blue iridescent *speculum* of the wing—formed by the outer portion of the outer web of the secondaries—are also marked characteristics of this beautiful bird; the plumage of which exhibits greater brightness of colors—during the breeding season at least—in the wild than in the domestic variety. At the close of the breeding season, the male of the wild-duck assumes for a time a plumage more sober, and resembling that of the female; but before winter, the splendid plumage proper to his sex is again acquired. The mallard or wild-duck is a widely-distributed bird, being found in the northern parts of Europe, Asia, and America, and extending southward as far as Florida—where it is abundant—and the West Indies, although in the old world it is not known as belonging to regions of similar climate. It was formerly much more abundant than it now is in Britain, the drainage of marshes having apparently tended more than any other cause to the diminution of its numbers. Multitudes of mallards, however, still visit the fen counties of England in winter; and great numbers are taken in decoys, along with other *anatidæ*, and sent to the London market. See WILDFOWL. Many wild-ducks, however, still breed in Britain, sometimes near the lakes or rivers which they frequent, sometimes in more elevated moorish districts, from which the parents often take opportunity of bringing their very young brood to the lower waters, by swimming down the streams on some occasion of their being swollen by rain, and it is interesting to see the little creatures hurried on, without injury, by the current, and passing along narrow rapids and over waterfalls of considerable height, much as pieces of cork might do, and with as little apparent injury. The nest is composed of grass, intermixed and lined with down, and the eggs are usually 9 to 12 in number.

This species, in a wild state, always pairs, but in domestication it becomes polygamous, and the care of the young is left entirely to the female. It has been long common in the poultry-yard, being valued for its eggs and its flesh; and there are breeds, as the Aylesbury D., etc., remarkable for their great size and delicacy of flesh. In situations where they have ready access to a lake, pond, or stream, ducks are easily managed, and very useful poultry. In other circumstances, they cannot be kept with advantage.

The species most nearly allied to the common D. is said to be the JAVANESE DUCK

(*A. Javanensis*). The BLACK DUCK or DUSKY DUCK (*A. obscura*) of North America is also very nearly allied to it, and is generally distributed from Labrador to Texas. The summer D. or wood D. of North America, and the Mandarin D. or Chinese D., belong to a nearly allied genus or sub-genus (*dendronessa*), with shorter bill and pendent occipital crest. See SUMMER DUCK. The TREE DUCK, or WHISTLING DUCK, of the warmer parts of America, also belongs to a distinct but nearly allied genus or sub-genus (*dendrocygna*).

DUCK-BILL, *Ornithorhynchus*, or *Platypus*, a genus of *mammalia*, of the order *monotremata* (q.v.). Only one species is fully ascertained, *O. paradoxus* or *P. anatinus*. It inhabits the rivers of Australia, Papua, and Tasmania. In the Australian colonies it is generally called WATER MOLE. The first descriptions of this singular quadruped were received with incredulity, and even when a stuffed specimen was brought to England, it was suspected to have been ingeniously fabricated. The whole length, including bill and tail, is usually from 20 to 23 inches. The body is rather long and compressed, thickly covered with very glossy hair, among the roots of which there is a layer of soft short waterproof felt or wadding. The head is small and round, with small bright eyes, and no external ears, although the internal ears are perfectly developed, and the hearing acute; and instead of the muzzle, mouth, and teeth of an ordinary quadruped, the creature is furnished with a bill like that of a duck, but broader in proportion, near the extremity of the upper mandible of which the orifices of the nostrils are placed. The bill is covered with a leathery membrane. There are no true teeth, but the bill has small transverse laminæ, like the bill of a duck; and at its base, on each side of each jaw, are two horny protuberances without roots or bulbs. The tongue is beset with villosities, does not extend to the extremity of the bill, and bears at its base what has been described as another tongue of a thicker form, and with two little fleshy points in front. The legs are short; the fore-feet have each five toes, with strong burrowing claws, and a connecting membrane for swimming, which extends even beyond the claws, but is capable of being folded back, so as not to impede their use in burrowing. The hind-feet are smaller than the fore-feet; they have each five toes armed with claws, and webbed, but the web does not extend beyond the base of the claws. The hind-feet of the male are armed with sharp spurs, like those of a cock, which are merely rudimentary in the female. These spurs were at one time erroneously supposed to be venomous. The tail is strong, broad, and flattened, about half as long as the body, covered with longer and coarser hairs, and nearly naked on its under surface. The duck-bill, besides the characteristics of the *monotremata*, exhibits other anatomical peculiarities which resemble those of birds, and some—principally osteological—which even resemble those of saurian reptiles. It lives chiefly in the water, and seeks its food by means of its bill in the mud, like ducks. Its food consists chiefly of aquatic insects, mollusks, etc.; but it is said also to feed on small fish, and even on vegetable food; and in confinement, it can be fed on worms, mince-meat, or egg, and bread and milk. It makes serpentine burrows of great length—20 or even 50 ft.—in river-banks, entering near the water's edge, and enlarged at the termination into a receptacle or nest, which is furnished with dry weeds for the accommodation both of parents and young. The young are produced in a very imperfect state: the duck-bill is indeed strictly ovoviviparous; the fetus receives no nutriment from the parent before birth, except what it derives from the ovum, which, however, is hatched within the body of the parent; but the young are suckled, and the mouth is adapted to this by the comparative shortness of the bill and greater length of tongue at this period of life. The duck-bill is lively and active, and so readily alarmed by the appearance of danger as not to be easily shot, diving before aim can be taken. It is usually to be seen with only its head above the surface of the water. It prefers the twilight to the glare of day. Its voice resembles the growl of a small puppy. It carefully dresses and pecks its fur. When asleep, it rolls itself up into a ball.

DUCK CREEK, a water-course of central Australia, is the largest of the channels which drain into the Darling (q.v.).

DUCKING-STOOL, an apparatus at one time in use in Britain for the punishment of scolding wives. The ducking-stool grew out of the cucking-stool, which was not, as many have supposed, a mere difference of name for the same thing. The cucking-stool of itself did not admit of the ducking of its occupants. It was a simple chair in which the offender was placed, usually before her or his (for the cucking-stool was not so specially for women as the ducking-stool) own door, to be pelted and insulted by the mob. In conjunction with another instrument of degradation, however—the tumbrel—the cucking-stool was occasionally used for ducking; but the ducking-stool *par excellence* was specially made for purposes of immersion. There were various examples of the ducking-stool. Sometimes it "consisted of a rough strong chair attached to one end of a beam, which worked on a pivot on a post bedded into the ground at the edge of the dam," or the river, as the case might be. "The woman was placed in the chair with her arms drawn backwards; a bar was placed across her back and in front of her elbows;" another bar held her upright, and there were cords to tie her securely in. The executers of the punishment then took hold of a chain at the opposite end, and gave her a ducking on the "see-saw" principle. A ducking-stool was in use for actual duck-

ing at Leominster as recently as 1809. The beam to which the chair was attached was 23½ ft. in length, the ducking being administered in the manner previously described. Other ducking-stools consisted of an upright and transverse beam, either movable or fixed, from which the chair was suspended by a rope or chain. The practice of ducking commenced in the latter part of the 15th c., and prevailed generally throughout the kingdom until the first part of the 18th c., and in isolated cases, as we have seen, even into the 19th century.

For the facts of this article we are indebted to a paper by Mr. Llewellynn Jewitt in the *Reliquary*. See also Chambers's *Book of Days*.

DUCKWEED, *Lemna*, a genus of plants, referred by many botanists to the natural order *araceæ*, but regarded by others as the type of a small natural order, *lemnaceæ*, which consists chiefly of floating plants, mere flat green fronds, with roots hanging loosely in the water, and unisexual flowers—destitute of calyx and corolla—bursting through a membranous spathe in their margin. The *lemnaceæ* are distributed throughout all parts of the world. Several species of D. are British, and cover the surface of stagnant ponds with green vegetation. Their flowers and fruit are rarely to be seen, but they spread rapidly by new fronds budding from their margins.

DUCLOS, Charles Pineau, 1704–72; a native of Brittany; writer of romance and history. Among his works were *Acajou and Zirphile; The Baroness de Luz;* and *Confessions of the Count de XXX*, all romances; *History of Louis XI.; Secret Memoirs of the Reigns of Louis XIV. and XV.; Considerations on Italy*, etc. Though living in Paris he was elected mayor of Dinant, and was chosen deputy to the assembly of the states of Brittany. At the request of that body he was granted a patent of nobility.

DUCORNET, Louis César Joseph, 1806–56; a French artist. He was born without arms, and learned to use his feet for hands. Having a talent for painting, he made such excellent drawings with his toes that at the age of 13 he was taken into the academy as a pupil. When but 16 he took the first prize for drawings of the human form, and both the national government and his native city settled pensions upon him. Not only was he without arms, but he had only four toes on each foot, and his lower limbs were far from perfect. In conversation, he gesticulated with his legs. He was expert in painting, and among his best efforts were "Parting of Hector and Andromache," and "Edith Finding the Body of Harold."

DUCROT, Auguste Alexandre, b. 1817; a French general, educated at St. Cyr; served in Algeria and Africa, and in 1869 in command of the 6th division quartered at Strasburg. He fought at Sedan, and when MacMahon was wounded, took the chief command. After surrender he refused to accept conditions, escaping to Paris, and took command of the 13th and 14th army corps. He participated in the last disastrous sortie, Jan. 19, 1871. After the fall of Paris he was elected to the national assembly. He published *The Truth about Algeria; The Day of Sedan;* and some other works.

DUCTIL'ITY is that property of bodies by which they are capable of being drawn out in length, while diminishing in breadth, without fracture or separation of their parts. Ducility is peculiarly noticeable in the case of metals. It is possessed also by gums, glues, resins, and some other bodies, which, when softened by water or heat, may be drawn into threads. Clays, when moistened, become ductile. Metals are ductile, generally speaking, at any temperature, but their D. is much influenced by temperature; some—brass, for example—are more ductile at ordinary temperatures than when hot. Metals are ductile nearly in the order of their malleability (q.v.), the order of their D. being as follows, beginning with the highest: gold, silver, plantinum, iron, copper, zinc, tin, lead, nickel, palladium, cadmium. Some, however, as iron, are more ductile than malleable. The D. of gold and glass is surprising; see article Divisibility for an account of the fineness to which gold-gilt, silver wire, and glass tubes have been drawn. The D. of glass at red heat seems to have no limit; at high temperatures, this brittle substance may be drawn into threads finer than any hair, and of the highest flexibility. Its flexibility, indeed, according to some, increases in proportion to the fineness to which its threads are drawn, and it is conceived to be possible that we may yet convert glass into cloths for wearing apparel.

DU DEFFAND, Marie de Vichy Chamrond, Marquise, a celebrated Frenchwoman, was b. of a noble family of Burgundy in 1697, and educated at the convent of La Madeleine de Trenelle, in Paris. Here she manifested that boldness of opinion and vivacity of intellect which obtained for her so many distinguished admirers in after-years. Her parents, alarmed at her skepticism, sent the eloquent Massillon to converse with her, who was, however, more struck with the wit and beauty of the young lady, than she was with the force of his arguments. In 1718, she married the marquis Du Deffand. The union was unhappy, and a separation took place, whereupon the marquise threw herself into all the excesses of gallantry which characterized French society in the 18th c., and had the name of being, for a time, the mistress of the regent. Subsequently a reconciliation took place between her and her husband, but it lasted only a short period. She then set up an establishment of her own, and gathered round her all the wits, philosophers, and men of fashion in her day. Among her friends and correspondents may be mentioned D'Alembert, Voltaire, president Hénault, Montesquieu, Marmontel, and

Walpole. Her evening-parties at her residence in the rue St. Dominique were famous. They formed a rendezvous for all the notabilities of Paris, and were much relished by distinguished foreigners visiting the city. In 1753, she became blind, and in the following year chose as companion and reader a young lady, Mlle. de l'Espinasse, of whom, however, she became very jealous, on account of the attentions paid to her by the friends of the marquise. In 1764, the two ladies separated, Mlle. de l'Espinasse carrying with her a large number of enthusiastic partisans, who deserted the saloon in the rue St. Dominique, at the head of whom was D'Alembert. The marquise Du D. died 24 Sept., 1780. Her correspondence with D'Alembert, president Hénault, Montesquieu, and the duchesse du Maine was published in 1809; and in the following year appeared at London her correspondence with Horace Walpole (written between 1766 and 1780), to which were added her letters to Voltaire.

DUDEVANT, Amantine Lucile Aurore, Madame, a French authoress, who has attained an extraordinary celebrity under the name of George Sand. She was b. at Paris in 1804, and descended by the father's side from the famous marshal de Saxe. Her maiden name was Dupin. After having received a strict conventual education (1817–20), she married M. Dudevant in 1822; but in the course of a few years, finding the lack of congeniality of sentiment intolerable, she arranged a separation with her husband in 1831, and repaired to Paris, where at first she was hard pushed to secure a livelihood. Her first literary efforts made their appearance in the *Figaro*. In conjunction with her friend and companion for the time, Jules Sandeau, from whose name she formed her *nom de plume*, she wrote a romance, entitled *Rose et Blanche* (1832), which only occasionally rises above mediocrity, and gave no hint of the splendid ability first fully developed in *Indiana*, published in the same year. This romance, in which a glowing heart, deeply wounded by the pressure of social relations, gives vent to its feelings, excited considerable interest. This was increased to the utmost by the succeeding romances—*Valentine* (1832); *Lélia* (1833); *Jacques* (1834); *André* (1835); *Leone Leoni* (1835); and *Simon* (1836). During the next two years, she published a great variety of works, in which she showed herself to be deeply influenced by the age in which she was living. In addition to her purely imaginative productions, Madame D. found time to contribute miscellaneous essays and political articles to the journal entitled *Le Monde*, so long as it was edited by Lamennais. She was much occupied at this time with philosophical and theological speculations, and their influence may be traced in the *Spiridion* (1839), and the extraordinary piece of prose poetry, entitled *Les Sept Cordes de la Lyre* (1840). She cherished, moreover, republican ideas of the wildest nature, which appeared conspicuously in the *Compagnon du Tour de France* (1840), and in *Pauline*. Her brilliant literary success having now placed her in comfortable circumstances, she obtained a legal divorce from her husband, and thus secured possession of a portion of the property which she had brought to him as her dowry. She now occupied herself with the education of her two children, and spent her time, sometimes in Paris, sometimes at her estate in Berri, where she had passed her childhood, or in journeys into Switzerland and Italy. A dispute with the editors of the *Revue des Deux Mondes*, which, from 1833 to 1841, had regularly published her works in chapters before they appeared in a separate form, induced her to start the *Revue Indépendante*, in conjunction with P. Leroux and Viardot. For this new review, she wrote *Horace*, *Consuelo*, and *La Comtesse de Rudolstadt* (1842–43), three romances deeply imbued with democratic feelings and sentiments, which are apparent likewise in *Jeanne* (1844), and which in the *Meunier d'Angibault* (1845), becomes altogether socialistic. It would be impossible to enumerate the works which flowed from her rapid pen between this period and the revolution of 1848. It is sufficient to say that her socialistic sympathies predominate in all of them; but if the logic is not convincing, the vigor and purity of her imagination are undeniable. This is always the case with Madame Dudevant. Even those who disapprove of her exaggerated and one-sided ideas, and views of life, must admire the perfect form, the captivating style, the plastic finish, and the great affluence of thought and sentiment displayed in all her productions. Her finest romances are *Valentine*, *André*, and, in particular parts, *Consuelo*, which is her best known work. Of her smaller pieces, *La Mare au Diable*, is a masterpiece of its kind, and indeed, considered from an æsthetic point of view, is the most complete production of her pen. After the revolution of Feb., Madame D. for a short time wasted her talents on the barren politics of the day. She subsequently devoted herself to writing plays, which were received less favorably than her novels, though the *Marquis de Villemer*, and one or two more, were very successful. In 1854, she published *Histoire de Ma Vie;* in 1871, *Journal d'un Voyageur pendant la Guerre;* and in 1873, *Impressions et Souvenirs*. Madame D. died on June 8, 1876.

DUD'LEY, a parliamentary borough in a detached part of Worcestershire, in the s. of Staffordshire, 26 m. n.n.e. of Worcester, and 8¼ m. w.n.w. of Birmingham. It is a well-built town, and a chief seat of the iron trade. On the n.e. of the town are the beautiful ruins of an old castle, founded in 760 by Dodo, a Saxon prince. It was demolished in the time of the civil wars of Charles I., was rebuilt, but was afterwards burned down in 1750. In the vicinity are iron and coal mines, and limestone quarries. The limestone is Silurian, and full of organic remains; it is wrought out of caverns, and brought

to the kilns through a tunnel one mile and three quarters long, which is carried through the basalt of the castle hill. Saline springs occur near. The chief manufactures are fire-irons, grates, nails, vices, chain-cables, other iron utensils, and glass. Pop. '71, m. b., 43,782; par. b., 82,249. D. sends one member to parliament. The living is a vicarage in the gift of the earl of Dudley, and valued at £1000 per annum.

DUDLEY, BENJAMIN WINSLOW, LL.D., 1785–1870; b. Va.; a surgeon, educated in Transylvania and Pennsylvania universities; studied in Europe, and settled in Lexington, Ky. His specialty was lithotomy, or removing stone from the bladder, of which his recorded operations numbered 225, with 6 deaths. He also successfully used ligatures on the carotid artery for aneurism in the skull. He was professor of surgery in the medical school of Transylvania university, which he organized, and which was long the leading medical school in the west; and author of a number of valuable papers.

DUDLEY, CHARLES EDWARD, 1780–1841; a native of England; came to America in 1794; in 1809, married into the Bleecker family of New York, and settled in 1811 at Albany. He was successively state senator, mayor of the city, and U. S. senator to fill the unexpired term of Martin Van Buren, whom Jackson had sent as minister to England. He was greatly interested in astronomical science, and after his death his widow gave $70,000 for the erection of the observatory at Albany, which bears his name.

DUDLEY, JOSEPH, 1647–1720; b. Mass.; son of Thomas, and also governor of the colony. He studied theology, but went into political life, and from 1677 to 1681, was one of the commissioners of the united colonies. He was at the battle with the Narragansetts in 1675, and one of the commissioners to make peace with that tribe. James II. made him president of New England in 1685; two years later, he was appointed chief-justice, and was arrested as one of the friends of Andros, with whom he was sent to England. In 1690, he was made chief-justice of New York. In 1693, he went to England, and in 1701, was elected to parliament. From 1702 to 1715, he was governor of Massachusetts colony. It is recorded that he was a philosopher, a scholar, a divine, and a lawyer, all combined.

DUDLEY, PAUL, 1675–1751; son of Joseph; graduate of Harvard; studied law in London; was commissioned attorney-general of Massachusetts in 1702, promoted to the bench in 1718, and made chief-justice in 1745. He was a member of the legislature, a learned naturalist, and a member of the royal society. He left a legacy to Harvard to establish a yearly lecture in defense of Christianity; and published a number of works, among them one against the church of Rome.

DUDLEY, THOMAS, 1576–1652; a native of England, who came to Massachusetts in 1630 as deputy-governor, and was governor from 1634 to 1640, and again from 1645 to 1650. He had been an officer of the British force in Holland, and retrieved the fortunes of the earl of Lincoln by judicious management of his estates. He was a bold and somewhat intolerant man, but an efficient officer. He died at Roxbury, leaving a large estate. Simon Bradstreet was his son-in-law.

DUDLEY LIMESTONE, a highly fossiliferous Silurian limestone belonging to the Wenlock series (q.v.), which forms some of the most picturesque eminences around the town of Dudley. The masses of corals, shells, and trilobites which abound in this rock, form, when weathered, extremely beautiful cabinet specimens.

DUDLEY LOCUST, the popular name for a trilobite (*calymena Blumenbachii*, q.v.) which is very abundant in the Dudley limestone.

DUEL (Fr. *duel*, Lat. *duellum* or *dvellum*, which, as Cicero remarks [*Orat.* 45], was the old form of *bellum*, war), a combat between two persons, at a time and place indicated in the challenge, cartel, or defiance borne by one party to the other. A D. generally takes place in the presence of witnesses, called seconds, who regulate the mode of fighting, place the weapons in the hands of the combatants, and enforce compliance with the rules which they have laid down.

No trace of the D., as an institution, is to be found in the history of the classical nations of antiquity, the Latin word from which ours is derived having been used to signify a war between two nations. So long as men continued to be barbarians, their personal quarrels were no doubt decided in the ancient, as national quarrels still are in the modern world, by an appeal to physical force. But though war has been in all times the practical solution of strife, it was not till the middle ages that it came to be regarded as a means, in any sense judicial, of settling disputes. Hitherto, it had determined who was able to prevail, justice being set aside, but it was a new view that it would determine who ought to prevail on the principles of justice. The rationale of the *judicial combat* or wager of battle was probably two-fold. On the one hand, and generally amongst the people, it depended on a belief that God would interfere directly and miraculously in the conflict to protect the innocent, and to punish the guilty, and that thus the weakest combatant who had God on his side would prove more than a match for the strongest, when destitute of His aid. But there was a view of the matter which was not so directly superstitious, and which rested rather on a confusion between the principle of the original constitution and the principle of the transmission of rights. All human rights originate in the powers and faculties which God has given to man, and it was supposed that as the right originated in power, its continued existence in

the individual could be ascertained by ascertaining whether the power still existed in him. The error consisted, as we have said, in confounding the principle of the constitution with the principle of the transmission of rights. If a field which was claimed by two competitors had as yet been appropriated to nobody, or had been abandoned, and was, as lawyers say, *res nullius*, the fact of which of the two claimants ought to become the possessor, might be ascertained by judicial combat. But if it was already the property of one of them on a title which was to be held sacred, and the question was which of the two had this sacred title, that fact could never be determined by ascertaining which would have been in a condition to constitute it for the first time, had it been non-existent. The principle of the private D., in so far as it had any principle at all, and was not merely a piece of barbarous and irrational foppery, was precisely the same as that of the judicial combat. But the latter had been applied to a class of cases which admitted of legal investigation and decision, and it was consequently abandoned in the days of Queen Elizabeth; whereas the former was supposed to be a means of redressing wrongs which hardly can come within the cognizance of a human tribunal, and the consequence was that it continued in green observance in this country until recently, and is still in vigor in many continental countries.

Like the other peculiarities of mediæval life, the D. probably originated with the Germanic nations. It is said to have been introduced into legal proceedings in lieu of an oath by Gundebald, king of the Burgundians, in 501. Louis le Débonnaire was the first of the French kings who permitted litigants to appeal to arms. The practice was prohibited by Henry II., in consequence of a noted D. which took place in his presence between his friend, Francis de la Chastaignerie, and Guy Chabot de Jarnac, in which the latter was slain. The royal edict, however, was totally ineffectual, and the practice of private dueling has generally prevailed more extensively in France than in any other country. Francis I. patronized it by declaring that a lie could be borne without satisfaction only by a base-born churl, and still more by the example which he set in challenging his own great rival Charles V. In 1589, the parliament of Paris declared all persons who were either principals or seconds in D. to be rebels to the king. But its efforts were unavailing; and it is said that during the first 18 years of Henry IV., no fewer than 4,000 gentlemen perished in this foolish manner. In 1609, Henry added to the existing penalties, introducing even punishment by death in extreme cases. But these regulations were forced upon him by popular feeling; he had himself no aversion to the practice, and when he gave permission to Crequi to fight Don Philip of Savoy, he added: "If I were not the king, I would be your second." The consequence of this feeling was, that he readily granted pardons to those who had violated the laws which he had been forced to enact, and these laws not unnaturally produced an effect the very reverse of their ostensible object. Dueling acquired the charm of what the French call "forbidden fruit," and thus became a fashionable and favorite vice. In the reign of Louis XIII., the custom was so prevalent, that lord Herbert, the English ambassador, wrote home to his court that there was scarcely a Frenchman worth looking on who had not killed his man. It would not seem, however, that it was from negligence in enforcing the royal edicts that dueling then reached to so alarming a height; for it was during this reign that two noblemen, the greatest duelists of the day, the count de Boutteville and the marquis de Beuron, were tried and beheaded for persisting to fight. In the commencement of the reign of Louis XIV., D. with four or five a side began to be fought; and two very sanguinary affairs of this description having taken place, in which several persons of the highest rank were slain, the king determined to put an end to the practice. He published an edict in 1679, forbidding it under the highest penalties, which, unlike most of his predecessors, he had the firmness to inflict; and this measure, together with a solemn agreement which was entered into amongst the nobility themselves, led at that time to its almost total abolition.

The D. does not seem to have existed in Egland in Anglo-Saxon times, and was probably introduced at the conquest. In its judicial form, it was not entirely obsolete in the reign of queen Elizabeth; and sir Henry Spelman gives an account of a trial by battle, which terminated, however, without actual combat, in the year 1571. See BATTLE, TRIAL BY. Private dueling was common, however, both in Elizabeth's reign and in that of her successor, by whom a severe statute against it was enacted in Scotland (1600, c. 12). During the civil wars, men's minds were too much occupied with questions of grave importance to leave time for questions of etiquette, and the D. consequently declined; but it became exceedingly prevalent during the dissolute reign of Charles II. Some attempts were made to suppress it in the reign of William III., both in England and Scotland, and, in 1712, the subject was recommended to the attention of parliament in the queen's speech. But the bill which was brought in by the government was thrown out, and the practice continued to prevail. When the custom of wearing the sword was abandoned, the number of duels diminished, though it was then that their irrational character may be said to have attained its maximum. The pistol was substituted for the sword, and the doctrine of chance—which was reduced to an absurdity by the medical D. of a couple of pills, one composed of bread and the other of poison—was inaugurated. Since this period, the practice has fallen into disrepute, by the gradual operation of public opinion, and in this country it may probably be now regarded as finally abolished. By the law of this country, the act of killing in a D. has always been

regarded as murder, however fair the D. may have been; but whilst the practice was countenanced by public opinion, it was generally found impossible to induce a jury to convict. That a verdict of acquittal could not be looked for with the same security in the present day, is probably a pretty good guarantee for the practice not again making its appearance even in exceptional instances. In France it still prevails to a certain extent.

The duels of the students at the German universities, of which so much has been said and written in this country, are nothing more than fencing-matches with sharp weapons. They are foolish, but not deadly affairs, as the seconds, who are also armed, always interfere to prevent serious bloodshed.

In 1844, several new articles of war were issued by the commander of the forces, with a view to the abatement of dueling in the army.

1. Every officer who shall send a challenge, or who shall accept a challenge to fight a D. with another officer, or who, being privy to an intention to fight a D., shall not take active measures to prevent such D., or who shall upbraid another for refusing or not giving a challenge, or who shall reject or advise the rejection of a reasonable proposition made for the honorable adjustment of a difference, shall be liable, if convicted before a general court-martial, to be cashiered, or suffer such other punishment as the court may award.

2. In the event of an officer being brought to a court-martial for having acted as a second in a D., if it appear that such officer exerted himself strenuously to bring about an honorable adjustment of the difference, but failed through the unwillingness of the adverse parties, then such officer is to suffer such punishment as the court shall award.

3. Approbation is expressed of the conduct of those who, having had the misfortune to give offense to, or injure or insult others, shall frankly explain, apologize, or offer redress for the same, or who, having received offense, shall cordially accept frank explanations or apologies for the same; or, if such apologies are refused to be made or accepted, shall submit the matter to the commanding officer; and, lastly, all officers and soldiers are acquitted of disgrace or disadvantage, who, being willing to make or accept such redress, refuse to accept challenges, as they will only have acted as is suitable to the character of honorable men, and have done their duty as good soldiers who subject themselves to discipline.

Partly in consequence of these regulations, but still more as a result of the increasing reason and humanity of English society, the practice of dueling has become almost as entirely obsolete in the British army as it has in the country generally. See ORDEAL.

DUEL (*ante*). In the southern portion of the United States the custom of dueling, though of late years falling into disuse, is a recognized institution of society. Half a century ago the pistol and the bowie-knife were as much a part of a man's equipage as his hat or his boots. A gentleman of good social position who had not fought at least one duel was often looked upon as deficient in the qualities proper to his station. Sudden affrays in the streets, stealthy assassinations, and bitter family feuds, were the consequences. These feuds rivaled in duration and ferocity the Venetian vendetta. The land was full of swaggering bullies who had, metaphorically, in one hand a pack of cards and in the other a pistol. Modern civilization, and more especially the war of the rebellion, in which the southern states suffered so terribly, have greatly modified this fire-eating spirit. Other influences have assisted. Not only is the general voice against the practice, but in a large number of the states laws have been enacted which pronounce the killing of a fellow-being in a duel to be murder, and in still more states the mere sending of a challenge is a felony. The first duel on record in America was fought June 18, 1621, in New England, between two servants who fought with sword and dagger, and both were wounded. They were sentenced to have their heads and feet tied together, and lie 24 hours without meat or drink. In 1728, one young man killed another on Boston common in a night duel with swords. The survivor escaped from the country, and a severe law against dueling was enacted. During the revolution there were a number of duels. Charles Lee and John Laurens fought, and the former was wounded; Gwinnett, a signer of the declaration of independence was killed by gen. McIntosh. Gen. Greene was twice challenged, but refused to fight, and Washington approved his refusal. The most notable duel in the country's history was when Alexander Hamilton was slain by Aaron Burr. On that occasion a great man was lost to the nation, and a dangerous demagogue was socially and politically ruined. In the navy the duel in which Decatur was killed and Barron wounded holds the first place. Andrew Jackson killed a man named Dickinson, and was engaged in several other conflicts. Col. Benton killed Lucas, and also had other duels. Henry Clay and John Randolph, the two most brilliant men at that period in congress, fought in 1826. Jonathan Cilley, a member of congress from Maine, was killed by William J. Graves, a member from Kentucky, in 1838. Although himself a duelist, Jackson, while president, expelled officers from the navy for dueling. At the present time a person in the military or naval service implicated in a duel, either as principal or second, may be summarily cashiered. In the northern states the appeal to arms is seldom heard of, though by no means uncommon at the beginning of the century. De Witt Clinton fought with and wounded John Swartwout in 1802, and the next year challenged gen. Dayton of New

Jersey. One might suppose that journalism was a calling of any other than a warlike nature, but there have been several notable duels between editors. In 1804, James Cheetham, editor of the *American Citizen*, challenged William Coleman, editor of the New York *Evening Post*. The two did not fight, but there was a duel growing out of the challenge between Coleman and a harbor-master named Thompson, and the latter was supposed to have been killed. John D'Oley Burke, an Irishman, author of a drama called *Bunker Hill, or the Death of Warren*, and editor of a paper in New York, was killed in a duel in 1808. In 1846, Thomas Ritchie, jr., and John H. Pleasants, editors of the *Enquirer* and the *Whig* of Richmond, Va., met in a field, armed with swords and pistols, and had a desperate fight, in which Pleasants was killed, Ritchie being only slightly wounded. In 1842, James Watson Webb, editor of the New York *Courier and Enquirer*, fought with Thomas F. Marshall, a member of congress from Kentucky, and Webb was slightly wounded. The number of duels among editors in the southern states is very great. In some of the states the killing of a man in a duel is punishable with death; in others by imprisonment and forfeiture of political rights. In some states certain officers are required to swear that they have not been, within a certain period, and will not be, engaged in a duel.

DUENNA (feminine of "Don"), a woman in Spain, something more than a governess, and something less than an equal of the family, having charge of a gentleman's daughters, or being companion to the lady of the house.

DUER, JOHN, LL.D., 1782–1858; b. N. Y.; a distinguished jurist; son of William Duer, a revolutionary patriot whose wife was a daughter of William Alexander, claimant of the earldom of Stirling. Duer studied law, and from 1820 until his death was in practice in New York. In 1825, he was one of the commissioners to revise the laws of the state; in 1849, he was elected justice of the superior court, and in 1857, became chief-justice. He published *Duer's Reports*, works on marine insurance, and addresses before the New York historical society.

DUER, WILLIAM ALEXANDER, 1780–1858; b. New York; brother of John. Through his mother he was grandson of lord Stirling. He studied law, and about 1802 became a partner of Edward Livingston, in New Orleans. About 1812, he returned to New York, where from 1822 to 1829, he was a judge of the supreme court. In 1829, he was elected president of Columbia college. He published a *Treatise on the Constitutional Jurisprudence of the United States*.

DÜET, in music, a composition for two voices or instruments.

DUFAURE, JULES ARMAND STANISLAS, b. Saujon, France, 1798; studied law in Paris, and in 1834 was chosen deputy from Saintes, and regularly re-elected until 1848. He was councilor of state in 1836, and minister of public affairs in 1839. In 1844, he was chosen vice-president of the chamber, and after the revolution of 1848, was minister of the interior. Louis Napoleon gave him the same office, but after the *coup d'état* he returned to private life. In 1871, he was made minister of justice and vice-president of the council of ministers, but these offices were taken away in 1873.

DU FAY, CHARLES FRANÇOIS DE CISTERNAY, 1698–1739; b. Paris. He made important researches concerning the barometer, the nature of phosphorus, the refracting power of crystals, electricity, and the magnet. He spent many years in rearranging and improving the garden of plants in Paris.

DUFF, ALEXANDER, D.D., LL.D., who so thoroughly identified himself with the cause of Indian missions, was b. 25th April, 1806, at a farm near Pitlochry, in Perthshire. He studied at the university of St. Andrews with great success. In 1829, he resolved to go out to India as a missionary from the church of Scotland; and in Oct. of that year, having been previously ordained, he set sail from Portsmouth for India. On the passage out, he was wrecked on a barren island to the n. of the cape of Good Hope, and at length reached his destination after a disastrous voyage of eight months. At the disruption in 1843, the missionaries in India being obliged to declare with which party they would connect themselves, D. resolved to cast in his lot with the free church, and for 20 years carried on with great energy the missionary work at Calcutta under the auspices of that body. In the year 1837, he received the degree of D.D., in acknowledgment of his distinguished services. D. visited his native land twice after 1829, before returning altogether in 1863. He was moderator of the general assembly of the free church in 1851 and 1873, and was professor of evangelistic theology in the free church colleges. He took an important part in various philanthropic societies and schemes. Dr. D. was gifted with great fervor and extraordinary fluency as a speaker, and he wrote voluminously. Amongst his writings are, *New Era of the English Language and Literature* (1837); *Missions the Chief End of the Christian Church* (1839); *India and Indian Missions* (1839); *The Indian Rebellion, its Causes and Results* (1858). *The Calcutta Review* was mainly established by Dr. Duff. He died 12th Feb., 1878.

DUFFERIN, FREDERICK TEMPLE HAMILTON BLACKWOOD, Earl of, b. England, 1826; educated at Eton; succeeded his father in 1841 as fifth baron Dufferin and Clandeboye. He was for some years lord-in-waiting on the queen. During the Irish famine of 1846–47, he traveled in that country, and wrote an account of the wretchedness. In 1855, he was attached to the Austrian mission. In 1859, he made a yacht voyage to

Iceland, an account of which he published in *Letters from High Latitudes*. In 1860, he was sent as British commissioner to Syria to inquire into the massacre of Christians. In 1864, he was under-secretary of state for India, and in 1866, under-secretary of war. Gladstone, in 1868, made him chancellor of the duchy of Lancaster; and in 1872, he was appointed gov.gen. of the dominion of Canada, where he had great popularity. In 1876, he made a tour through British Columbia. In 1878, he was superseded by the marquis of Lorne, and was immedialely elected president of the royal geographical society. He was made an earl in 1871.

DUFOUR, Guillaume Henri, a Swiss gen., was b. at Constance in 1787, of a Genevese family. While Switzerland formed part of France, he studied at the Polytechnic school of Paris for two years; and on leaving it, he received an appointment as an officer of engineers in the French army. At the fall of Napoleon, he entered the Swiss service, and rapidly rose to the rank of col. When the government survey of Switzerland was undertaken, he was appointed director—at the same time acting as the principal of the Swiss military school at Thun. In 1840, he published *A Treatise on the Artillery of Ancient and Mediæval Times;* and in 1842, *A Manual of Military Tactics.* In 1847, he was raised to the rank of gen., and intrusted with the command of the army employed against the Sonderbund. He defeated their forces at Freiburg (13th Nov.) and at Lucerne (24th Nov.); and by his promptitude and skillful maneuvers, secured a triumph for the liberal party in time to prevent the interference of foreign powers, diplomatically or otherwise. The diet voted him a gift of 40,000 francs, and for a time he was the most popular man in Switzerland. His politics were not, however, those of the Genevese democrats, and in 1848 they deprived him of the public offices he had previously held. In 1856, he was again admitted to the council of Geneva, and sent on a special mission to Louis Napoleon *à propos* of the dispute between Switzerland and Prussia about Neufchatel (see Kern). In 1864, he acted as president of the conference held at Geneva relative to the treatment of the wounded in time of war. In 1869, he presided at a fête in celebration of the jubilee of the reunion of Geneva with Switzerland. He died in 1875.

DUFRESNE, Charles, Seigneur du Cange, hence generally styled merely Ducange, a French author, distinguished by his historical and linguistic writings, belonged to an ancient family of Picardy, and was born at Amiens, 18th Dec., 1610. After having received the rudiments of a scientific education at the Jesuits' college in his native town, he studied law at Orleans, and in 1631 became parliamentary advocate at Paris, where he continued to reside till his death, 23d Oct., 1688. There was scarcely any branch of science with which he was unacquainted, but his favorite studies were classical philology and history. Among his historical works may be mentioned the *Histoire de l'Empire de Constantinople sous les Empereurs François* (Paris, 1657). He also edited, along with other scholars, the *Corpus Historiæ Byzantinæ* (Paris, 1680), and Joinville's *Histoire de Saint Louis, Roi de France.* His two principal works, however, are the *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (3 vols. fol., Paris, 1678; much enlarged by the Benedictines of St. Maur, 6 vols. fol., Paris, 1733–36, to which four supplementary volumes were afterwards added by Carpentier, a Benedictine), and the *Glossarium ad Scriptores Mediæ et Infimæ Græcitatis* (Paris, 1688). Both works display great learning, good judgment, and admirable industry, and are extremely valuable contributions to the study of the history and antiquities of the middle ages. A new edition of the Latin glossary, incorporating all the previous supplements, together with additions of his own, was published by G. A. Henschel (7 vols. 4to, Paris, 1842–53); and a supplementary volume (*Latino-Germanicum*) has since been added by Diefenbach (Francf. 1857). D. left a large quantity of valuable manuscripts, which have been collected in the university of Paris.

DUGDALE, Sir William, a celebrated antiquary and historian, was b. in 1605 at Shustoke, near Coleshill, Warwickshire. He was educated for some time at the free school of Coventry, but left it at the age of 15, and continued his studies under the care of his father, who, having a decided predilection for the branches of civil law and history, seems to have encouraged similar tastes in his son. His antiquarian pursuits led to his being created (1638) a pursuivant-at-arms extraordinary by the name of Blanche Lyon; and shortly afterwards, he was made rouge croix pursuivant-in-ordinary. During the civil war, D. adhered to the royal cause, and lived for several years in Oxford, employed in researches for his great works. On the restoration, D. was made norroy king of arms, and in 1677 garter king of arms; at the same time, the king, much against the wishes of D., whose estate was but a poor one, conferred upon him the honor of knighthood. He died at his estate of Blythe hall, Feb. 10, 1686. His chief works are *Monasticon Anglicanum* (Lond. 1655–61–73), (which, though for the most part written by another antiquary, named Dodsworth, was concluded, arranged, indexed, and corrected by D.); a new and greatly enlarged edition of the *Monasticon* by Bandinel, Caley, and Ellis, was published in 1817–30, and reissued in 1846; *The Antiquities of Warwickshire* (1656; second edition revised and continued, 1730); *The Baronage of England* (1675–76); *Origines Juridicales, or Historical Memoirs of the English Laws,* etc. (1666; third edit. 1680); *Short View of the Late Troubles in England* (Oxford, 1681); *The Ancient Usage in Bearing Arms* (1682; new edition, 1811). D. bequeathed upwards of

27 folio MS. volumes, written in his own hand, to the university of Oxford. They are now in the Bodleian library, the Heralds' college, and the Ashmolean museum.

DUGONG', *Halicore*, a genus of mammalia, of the family *manatidæ* (q.v.), or herbivorous cetacea, distinguished by molar teeth with flat summits, and composed of two cones laterally united, the incisors of the upper jaw elongated almost into tusks; the tail forked or crescent-shaped; and the swimming paws destitute of any vestiges of nails. One species alone has been thoroughly ascertained and accurately described. The D. (*H. indicus*, or *H. dugong*) of the Indian archipelago is said to attain a length of 20 ft. when full grown, although it is more frequently seen of only 8 to 12 ft. long. In general form, it much resembles the manatee. The skull is remarkable for the sudden bending downwards of the upper jaw almost at a right angle. The upper lip is large, thick, and fleshy, covering the prominent incisors, and forming a kind of snout, "something like the trunk of the elephant cut short across." The eyes are very small, and are furnished with a third eyelid or *nictitating membrane*. The skin is smooth and thick, but yields no oil. The anatomy of the D. has been very carefully examined. It exhibits a very remarkable peculiarity, in the ventricles of the heart being completely detached from one another. Its osteology has been found to exhibit interesting points of correspondence with that of the *pachydermata*, as in the numerous ribs, etc.; its dentition resembles in some particulars that of the elephant; its digestive apparatus is adapted to vegetable food, differing very much from that of the whales, dolphins, and other ordinary cetaceans. It feeds on the algæ which grow on submarine rocks in shallow seas. Its lips are of much use in gathering together its food. It often comes to the surface to breathe, and is said to utter a peculiar cry. It is gregarious. The female produces one young one at a birth, and shows an affection for it which is proverbial among the Malays. When the young one is taken, the mother is easily secured. The D. is generally pursued in boats, and killed by spearing. The flesh is highly esteemed even by Europeans, and is described as resembling young beef. That of full-grown animals is, however, comparatively coarse, on which account, and the greater facility of capture, the younger ones are more frequently killed. According to Rüppell, it was with the skin of the D. of the Red sea that the Jews were directed to veil the tabernacle.

DUGUAY TROUIN, RENÉ, one of the most celebrated naval officers of France, was b. 10th June, 1673, at St. Malo, left the school at Caen, where he was to have studied theology, with the reputation of a good-for-nothing fellow, and betook himself to the sea. His career, which was very brilliant, may be divided into two parts, the first extending from 1689 to 1697, and the second from 1697 to the close of his life. During the former, he cruised about as a sort of privateer, inflicting immense damage on the enemies of France. The English merchantmen suffered severely from his attacks. In the channel, on the coasts of Ireland and Holland, in the Spanish Main, everywhere fortune followed Duguay. Louis XIV., as a reward for his daring exploits, admitted him into the state navy, and gave him the command of a frigate. The second part of his career was as brilliant as the first. In 1707, he engaged a part of the English fleet at the entrance of the channel, burned 1 ship, captured 3 others and about 60 transports; but the most glorious of his triumphs was the attack and capture of Rio Janeiro in 1711, after hostilities had lasted for 11 days. The city was ransomed for 610,000 cruzades. The South American expedition of D. T., which cost Portugal in all about 30,000,000 francs, put the seal to the celebrity of the French commander. He was successively named *chef d'escadre*, member of the council of the Indies, lieut.gen., and naval commandant at Brest. In 1731, Louis XV. sent D. T. into the Levant, to chastise the barbarians inhabiting the neighboring coasts, and to obtain reparation for the damages done to French commerce. In this also D. T. was successful. He died 27th Sept., 1736. His *Mémoires* were published by Beauchamps (4 vols., Paris, 1740).

DU GUESCLIN, BERTRAND, 1314–80; constable of France, and the most famous French soldier of the age. He was so remarkable for ugliness, when a child, as to be an object of aversion to his parents. He gained his first reputation as a soldier in 1338 at a tournament to celebrate the marriage of Charles of Blois with Jeanne de Penthièvre, at which he unseated all the famous competitors. Becoming a soldier of fortune under Charles, he gained great distinction at the siege of Vannes in 1342. He was knighted, and in 1351 went, with the lords of Brittany, to England to secure the release of his captive master. He gallantly relieved Rennes, besieged by the duke of Lancaster in 1356, and by his help the city held out till the truce of Bordeaux in June, 1357. He soon took service under the French king, and, after several brilliant actions, was made marshal of Normandy and count of Longueville. At the battle of Auray, in 1364, he was taken prisoner, but he was ransomed for 100,000 crowns; and becoming commander of the grand companies, led them into Spain, where he placed Henry of Trastamare on the throne of Castile in 1366. In the next year he was taken prisoner by the Black Prince, then in alliance with Pedro the cruel. Being again ransomed, he again restored Henry to the throne in 1369. In 1370, he was made constable of France, and for ten years was active and successful in driving the English from the s. and w. of France. In 1373, he seized and held the duchy of Brittany. He died while besieging the fortress of Châteauneuf-Randon. The garrison had already agreed to capitulate, and their commander led them out, and placed the keys of the castle upon the coffin of the constable.

DUHAMEL DU MONCEAU, HENRI LOUIS, 1700-82; a French botanist. For discovering the disease which was destroying the saffron plant (a parasitical fungus attacking the roots), he was made a member of the academy of sciences. Alone, and with Buffon, he made many experiments in vegetable and animal physiology, and the influence of the weather on agricultural production. Late in life he was appointed inspector-general of marine.

DUI'DA, a mountain of Venezuela, in South America, stands in lat. 3° 30′ n., and long. 66° 10′ west. It is of conspicuous form, being perpendicular on two sides, and bare at the summit. Rising, moreover, to the height of 8,500 ft., it forms a safe landmark for the voyager on the Orinoco.

DUIL'LIAN COL'UMN, erected in the forum at Rome in honor of the naval victory of C. Duillius. The name *rostratæ* was given to columns commemorating naval victories (from *rostra* the beak of a ship), as they had on each side projections in the form of such beaks. Michael Angelo restored this column, and his restoration is in the Palazzo de' Conservatori, on the Capitoline hill. Its pedestal retains a portion of the original inscription.

DUISBURG, a t. of Rhenish Prussia, about 15 m. n. of Düsseldorf, is situated in a fertile district, between the Ruhr and the Rhine, with both of which it is connected by a canal. It is surrounded partly by walls, flanked with towers, which are now somewhat decayed, and partly by a rampart and ditches. D. contains a gymnasium founded in 1599, a monastery of Minorites, and five churches, two of which—that of St. John the Baptist, dating from 1187, and St. Salvador's, are worthy of notice. Its manufactures are numerous and important; including tobacco, soda, sulphuric acid, and other chemicals, iron castings, soap, starch, and sugar; there is also a large trade in wine and colonial produce. In the neighborhood are iron-works and coal-mines. Pop. '75, 37,371. D. is an ancient town. In the 13th c., it was a member of the Hanseatic league, and afterwards a free town of the German empire, but at the close of the war in 1815 it was handed over to Prussia.

DUJARDIN, FELIX, 1801-60; b. Tours, France; studied mathematics and geology, but was induced by Dutrochet to turn his attention to zoology. His specialty was *Infusoria*, concerning which he arrived at conclusions different from those of Ehrenberg. He was professor at Toulouse and at Rennes, and wrote a number of works on his favorite subjects.

DUKE (Fr. *duc*, Lat. *dux*, from *ducere*, to lead), a term applied originally to any military leader. Gibbon informs us that the title came first into use when Constantine separated the civil and the military commands in the provinces, which had been exercised in common by such men as Agricola. From that time forth, the military governors of provinces were either counts or dukes. But these titles originally stood to each other in an opposite relation to that which they afterwards assumed. "It should be recollected," says Gibbon (iii. 57, cap. xvii.), "that the second of these appellations—that of D.—is only a corruption of the Latin word, which was indiscriminately applied to any military chief. All provincial generals were therefore *dukes*, but no more than ten among them were dignified with the rank of *counts*, or companions, a title of honor, or rather of favor, which had been recently invented in the court of Constantine." See COUNT. "A gold belt," continues Gibbon, "was the ensign which distinguished the office of the counts and dukes; and, besides their pay, they received a liberal allowance, sufficient to maintain 190 servants and 158 horses. They were strictly prohibited from interfering in any matter which related to the administration of justice or the revenue; and the command which they exercised over the troops of their department, was independent of the authority of the magistrates." When the Goths, and Franks, and other barbarians successfully invaded the provinces of the empire, they preserved the titles of count and D., if they had not already borrowed them from the Romans. But amongst races who owed their supremacy to the sword, no dignity could prevail over that of the commander of an army; and the dukes, as military chiefs, acquired a marked pre-eminence over the counts, whose lofty functions under the empire had been partly of a civil, and partly of a military nature. The only exception under the first Merovingians was in the case of the count of the palace. See COUNT. In the hierarchy observed by the Franks and other Teutonic races, the ordinary count became the lieut. of the D., and the government of the latter extended to several provinces; whereas that of the former was confined to one province, or even to a single locality. The power of the dukes grew so rapidly, in consequence of the dissensions of the Merovingians, that, towards the end of the 6th c. (582), they arrogated to themselves the right to dispose of the crown. Amongst the causes which tended to raise the power of the dukes, was the immense wealth which had been acquired by the great provincial families. The chiefs who had attached themselves to the fortunes of Clovis had been richly endowed with conquered lands. After the close of the 7th c., they overshadowed the crown, and the title of prince and chief (*chef*) began to be attributed to them. It has been said that the *ducs-maires* of the palace sometimes assumed the title of archduke (q.v.). Under the second dynasty, the title of duke retained all its dignity and importance, and it was to the successive invasions of local upon central power, that feudality owed its origin.

The concession, tacit or express, of hereditary power and independent jurisdiction, first to the central province known as the Isle of France, and then to Aquitaine, extended itself, under the Carlovingians, to Burgundy, Normandy, and Gascony; and on the accession of Hugo Capet, to all the other subaltern tenures. Once become unlimited masters of their respective legations, the dukes did not long delay to proclaim their title to be as good as that of the king. They assumed the crown and the scepter, promulgated laws for their subjects, struck money with their own image, and made war in their own name against the crown, with whom they balanced and several times divided the supreme authority. The confederation of the feudal lords had assumed such dimensions, that about the period of the Norman invasion of England nothing remained directly under the crown except a few towns, of which Rheims and Laon were the chief. The rest of the kingdom was divided amongst the dukes and the counts, under an obligation, which they almost always evaded, of service and fidelity to the crown. But the Capetiens had been enlightened by the fall of two dynasties, and were careful to delegate to no other hands the duchy of the Isle of France, which had so often been a stepping stone to the throne. When it became extinct in 887, it was not re-established, and that event was the signal for the restoration of a national character to France. The duchy of Gascony was joined to Aquitaine in 1052; and both provinces, along with Normandy, were finally re-united to the crown, in 1204, by confiscation. This latter duchy was sometimes given to princes of the blood, but without any separation of its fiscal arrangements from those of the kingdom. A part of Aquitaine was given up to England in 1259, and again ceded to France in 1453. The ducal sovereignty of Burgundy was extinguished in 1477, that of Brittany in 1514, of Narbonne in 1229, and of Toulouse in 1361.

The duchies which were subsequently granted to members of the royal family—that of Bourbon, erected in 1327; of Orleans, in 1344; of Auvergne, Berri, Touraine, Valois, and Alençon, at subsequent periods—enjoyed none of the privileges of independent sovereignty which had belonged to the ancient duchies. The subordination of these fiefs was absolute, and the princes who governed them, though placed on the steps of the throne, were only the first subjects of the realm. The tendency to diminish the actual power which anciently had attached to the ducal title, was still more apparent in the case of those dukedoms which were conferred on the representatives of illustrious noble families. The Montmorencies were created dukes in 1551, but they enjoyed no other privileges than those of titled nobles, and their position had no analogy whatever to that of the old provincial dukes. The duke-peers, as they were called, were simply the first class of nobles in France, just as dukes are with us in England; but they differed from English dukes, in that, after the extinction of the Comté pairie d'Eu, in 1775, the duke-peers alone sat in parliament. Several prelates enjoyed this rank—as, for example, the archbishop-duke of Rheims, the bishop-duke of Laon, and the bishop-duke of Langres. The archbishop of Paris took the same rank after the erection of St. Cloud into a ducal peerage in 1674. There were still two other sorts of dukes in France—the dukes who were not hereditary peers, and the dukes for life, or patent dukes, who date only from the reign of Louis XIV. Swept away by the revolution, the title was restored by Napoleon, who conferred it, with rich endowments, on his marshals. Several ducal peers were created by Louis XVIII. and Charles X.

In Germany, the dukedom passed through phases very similar to those which it exhibited in the earlier history of France. What is special to the position of the nobility of that country, will be stated under GRAF (q.v.).

Dukes, in the older European sense, do not appear ever to have existed in England. The title seems not to have been known earlier than the reign of Edward III., and from the first it was a mere honorary distinction. The Black Prince, who was created D. of Cornwall (see below) in 1335, was the first English duke. In 1350, Henry, the king's cousin, was created D. of Lancaster; and when he died, and his daughter was married to John of Gaunt, the king's son, the title was transferred to him—his elder brother, Lionel, being make D. of Clarence. In the succeeding reign—that of Richard II.—the two younger sons of Edward III. were created, the one D. of York, and the other D. of Gloucester. The dignity was thus, in the first instance, confined to the royal house. But the families of Holland and Mowbray very soon received the same title; and one of the Beauforts, an illegitimate son of John of Gaunt, was raised to the peerage by the title of D. of Exeter. In the reign of Henry VI., the title was granted more widely, and there were at one time ten duchesses in his court. The Staffords, Beauchamps, and De la Poles, belong to this period. King Henry VIII. created only two dukes—the one was his illegitimate son, whom he made D. of Richmond; and the other Charles Brandon, who married his sister, the French queen, and was made D. of Suffolk. Queen Elizabeth found only one D. when she came to the throne—Thomas Howard, D. of Norfolk—attainder or failure of male issue having extinguished the rest of them. After the attainder and execution of the D. of Norfolk, there was no D. in England, except the king's sons, till Ludovic Stuart, a relative of the king's, was made D. of Richmond in 1623. In 1623, Villiers was made D. of Buckingham. On the restoration, Charles II. restored the Seymours to the rank of dukes of Somerset, and created Monk D. of Albemarle. But the habit of conferring this dignity on the illegitimate sons of

the monarch was still adhered to, as in the case of the D. of Monmouth, who was the illegitimate son of Charles II.; and the D. of Berwick, of James II. Of the existing dukes besides the descendants of Charles II., there are only three families which date their dukedoms before the revolution—viz., the Howards, the Seymours, and the Somersets. It was William and Anne who, by advancing a very considerable number of the first families of peers to the rank of D., altogether changed its character. There are now 11 English dukes, 7 Scotch, 5 of Great Britain, 6 of the United Kingdom, and 2 Irish. These numbers do not include dukes of the blood-royal.

The DUCAL CORONET is composed of a circle of gold, with eight strawberry or parsley leaves, of equal height above the rim.

DUKE OF CORNWALL. The duchy of Cornwall was by royal charter of Edward III. conferred on his son Edward the black prince. King Henry IV. subsequently included the D. of C. in a patent in favor of his son Henry prince of Wales. But since that time, the duchy has belonged of right, without any special grant, to the king's heir-apparent from the time of his birth. On the death of the king's eldest son without issue, during the life of his father, the duchy descends to the next brother. In the event of the death of the heir-apparent without issue, and without leaving a younger brother, or in case the heir-apparent succeeding to the crown, the duchy of Cornwall merges in the crown until the birth of a son calls it again into existence. The uncertainty thus arising in regard to the duchy has produced much confusion in regard to leases held of the D., and various acts of parliament have been passed, from the 21 James I. to the reign of the present queen, to regulate this matter. The D. of C. formerly possessed "royal jurisdiction and crown rights, giving liberty to send burgesses to parliament, and appointing the sheriffs, admirals, and other officers."—Carew's *Cornwall*. At the present day, there is a separate chancellor, and attorney and solicitor general for the D. of Cornwall. The revenues of the duchy are considerable, arising partly from the rents, etc., of the different manors, and partly from the dues on tin, which is produced in large quantities from the Cornish mines. There is a special court for the settlement of questions arising among the miners, called the stannaries court (q.v.).

DUKE OF EXETER'S DAUGHTER, an instrument of torture resembling a rack, said to have been invented by the dukes of Exeter and Suffolk during the reign of Henry VI. This curious instrument was for some time preserved in the tower of London. Blackstone avers that it was never put into use.—*Blackstone*, iv. 326.

DUKES, a co. of s.e. Massachusetts, consisting wholly of islands in the Atlantic ocean; in all, about 118 sq.m.; pop. '70, 3,787. Martha's Vineyard is the largest island, and is about 5 m. from the mainland. There is some agriculture, but the chief business is fishing and commerce. Co. seat, Edgartown.

DUKE OF YORK'S SCHOOL is the popular designation for the *Royal Military Asylum* at Chelsea. In the French army, there have long been *enfans de troupe* borne on the books of each company or battalion of soldiers; that is, children of deceased soldiers, unprovided with other homes. In England, no such system prevails. The late duke of York, in the year 1801, used his influence to obtain the formation of a soldiers' orphan asylum. Accommodation was obtained at Chelsea; and in 1803, schools were opened for 700 boys and 300 girls, children of deceased soldiers. The institution has been kept up ever since for the boys, of whom 500 are now maintained, but was a failure as to the girls. The boys are wholly supported as well as educated. They are not bound to serve the state after they leave the asylum; but most of them nevertheless enter the army. A soldier's son has not a *right* of admission; a selection is made according as vacancies may occur. When the boys leave the school, those who do not enter the army are apprenticed to trades. The asylum is under a board of commissioners, who make the necessary rules and regulations. The chief officers are the commandant, secretary, quartermaster, head-master, chaplain, surgeon, and dispenser.

The expenses are defrayed by an annual parliamentary grant, included in the army estimates.

No provision is now made by the state for the *daughters* of deceased soldiers. The girls admitted into the asylum in the early years of its history, brought discredit to it by their after-life; and this part of the system was abandoned. There is only a royal patriotic fund asylum on Wandsworth Common, unaided by the state, for soldiers' orphan daughters; it originated during the Crimean war.

DU'KINFIELD, a township in the n.e. of Cheshire, 42 m. from Chester, and separated from Ashton-under-Line in Lancashire by the Tame. It has large cotton-factories, iron-foundries, fire-brick and tile-works, and collieries. Astley's new pit in this township, 690 yards in depth, is one of the deepest coal-mines in the world. Pop. '71, 14,085.

DULCAMA'RA, the young branches of bitter-sweet or woody night-shade (*solanum dulcamara*), a perennial plant of the order solanacèæ. The dried branches, sold by the druggists, contain an alkaloid, solanine, besides a sweet and bitter principle, dulcamarine or picroglycion, and other matters. It is feebly narcotic, with power to increase the secretions, particularly of the kidneys and skin. It sometimes produces a dark purple color of the face and hands, with languid circulation of the blood. Over-

doses produce nausea, vomiting, faintness, vertigo, and convulsive muscular movements. It is used in skin diseases, particularly those of a scaly character, as lepra and psoriasis, when it is often combined with antimonials; and has been used in chronic rheumatism and catarrh, also in some forms of mania. It is usually given in the form of a decoction, but there is an officinal inspissated and a fluid extract.

DULCE, a gulf in Costa Rica, on the Pacific coast, 8° 3′ n., 83° 53′ west. It extends over about 800 sq.m. and is fed by a small river of the same name.

DULCE, a lake in e. Guatemala, near Honduras, about 30 m. by 12, and from 30 to 60 ft. in depth. Its waters empty into a smaller and shallower lake called the Golfete, and thence reach the sea through the Rio Dulce, a narrow strait running between high hills. A bar at the mouth of this strait prevents the entrance of vessels requiring more than 6 ft. of water.

DULCIG'NO, a t. and seaport of European Turkey, province of Albania, is situated on the shore of the Adriatic, 15 m. s.s.w. of Scutari. The inhabitants were long notorious for piracy, but are now more creditably engaged in the oil and coasting trade. D. is the seat of a Catholic bishop. Pop. about 7,000.

DULCIMER, a musical instrument resembling a flat box, with sounding-board and bridges, strung with thin wire, and played on by striking the wires with a small piece of wood in each hand.

DULCOSE, or DULCINE, is a substance closely allied to manna-sugar or mannite, and imported from Madagascar. It consists of $C_6H_7O_6$, or $C_{12}H_{14}O_{12}$, is insoluble in boiling alcohol, and does not undergo fermentation.

DULONG, PIERRE LOUIS, 1785–1838; b. Rouen, France. His attention was given chiefly to natural sciences, and he made many valuable and some dangerous experiments in chemistry, losing a finger and an eye in his search for knowledge. He investigated the phenomena of animal heat, in company with Berzelius and Berthollet. With Arago he studied several years the elastic power of steam at different temperatures, trying to find preventives of steam-boiler explosions.

DULSE, *Rhodomenia palmata*, a sea-weed, one of the ceramiaceæ (q.v.), growing on rocks in the sea, and used as food by the poor on the coasts of Scotland, Ireland, and other northern countries, and of the Grecian archipelago, occasionally also as a luxury by some of the wealthier classes who have acquired a taste for it. It has a purple, leathery, or somewhat membranous, veinless, sessile frond, irregularly cut, with repeatedly forked segments, which are either entire at the edges, or furnished with lateral leaflets, the spores distributed in cloud-like spots over the whole frond. Its smell somewhat resembles that of violets. It is eaten raw or roasted, and with vinegar. In Iceland, it is sometimes boiled in milk. It is an important plant to the Icelanders, and after being washed and dried, is stored in casks, to be eaten with fish. In Kamtchatka, a fermented liquor is made from it. It is extremely common on all parts of the British coasts. Sheep are fond of it, and seek it eagerly at low water.—The cry "Dulse and tangle" was once common in Edinburgh.—The name D. is also given in the s.w. of England to another sea-weed, *iridæa edulis*, also one of the *ceramiaceæ*, which has an undivided, obovate or wedge-shaped, flat, expanded frond, very succulent, tapering to a short stalk, and of a dull purple color. It is occasionaly employed as food both in the s.w. of England and in Scotland, and is either eaten raw or pinched between hot irons.—PEPPER DULSE, *Laurentia pinnatifida*, another of the *ceramiaceæ*, has a compressed cartilaginous frond, twice or thrice pinnatifid. It has a pungent taste, and is used as a condiment when other sea-weeds are eaten.

DULUTH, a city, the capital of St. Louis co., Minnesota, at the western extremity of lake Superior, 155 m. n.e. of St. Paul. It is the point of departure of the Northern Pacific railroad, and has connection through St. Paul with all the great railroad lines extending eastward and southward to every part of the United States. The harbor, formed by two points, one of them extending 7 m. into the lake, is well protected, and has been to some extent improved. A ship-canal, 250 ft. wide, cut across Minnesota point, gives ready access from the lake. The Northern Pacific railroad has built large and substantial docks for its own use, and there are besides several docks and piers constructed by the citizens for general traffic. The government has constructed a breakwater for the protection of the outer harbor. The city derives its name from capt. Jean Du Luth, a French officer and traveler who visited the region in 1760. No longer ago than 1869 the site was a wilderness; one year later it had a pop. of 3,131; pop. '75, 5,000. It has a dozen churches, a custom-house, a weather-signal office, a national bank, several newspapers, manufactories of stoves, carriages, and machinery, and is the center of a growing trade in wheat, flour, and other commodities.

DULWICH, a suburb of London, in the n.e. of Surrey, 4½ m. s.s.e. of St. Paul's cathedral, and near Sydenham. Pop. '71, 4,041. It is a fine rural spot, has many genteel residences, and is noted for its college and picture-gallery.

DULWICH COLLEGE, or God's gift, was founded in 1619 by Edward Alleyne, a tragic actor. It maintains 12 poor brethren, 12 poor sisters, 12 poor scholars, and 16 out-pensioners. The old college buildings occupy 3 sides of a quadrangle, and comprise the

chapel, chaplain's house, alms-rooms, and the lower school, in which 160 boys receive a second-grade education at the nominal fee of £1 per annum. The upper school, giving a first-grade education, was, in 1870, transferred to new buildings, erected at a cost of nearly £100,000. It can accommodate 700 scholars. The picture-gallery, of choice old Italian, Flemish, and other paintings, was left to the college in 1811, by sir F. Bourgeois, and is much visited. The expenses of this important institution are chiefly defrayed by the revenues of the manor of Dulwich, which consists of about 1400 acres, and produces about £17,000 per annum.

DUMANGAS, a t. near the sea-coast, in the province of Ilbilo, island of Panay, one of the Philippines. The vast plain of D. produces abundance of rice. Pop. of town, 25,000.

DUMAS, ALEXANDRE, a French novelist, was the son of the republican general, Alexandre Davy-Dumas, who was himself the offspring of the marquis Davy de la Pailleterie and a negress. The crisp hair and thick lips of D. bore testimony to his African origin, a testimony which is confirmed by the savage voluptuousness and barbaric taste of his partial innumerable compositions. D. was born at Villers-Cotterets, 24th July, 1803. His father died when he was quite a child, and he received in consequence a very imperfect education. At the age of 20, he came to Paris to seek his fortune, and after a short time received an appointment in the household of the duc d'Orleans. In 1826, he first appeared as an author in a volume of *Nouvelles;* but it was not till 1829, when his historical drama, *Henri III. et sa Cour*, was brought upon the stage, that France fairly mistook him for a genius. This work appeared at the time when *romanticism* was beginning to triumph over *classicism* in French poetic literature, and was hailed by the advocates of the former as a crowning victory. The duc d'Orleans, who was delighted with the production, led the applause, on the first night of its representation, in honor of the author. Next morning, D. was made librarian to his highness. From this period, he became more and more a noted character in Paris, dexterously contriving at once to feast the appetites of the mob, and to continue the companion of princes. In 1846, he accompanied the duc de Montpensier to Spain, as the historiographer of his marriage. Afterwards, he visited Africa: and on his return to Paris, finding his income inadequate to meet the expenses of his costly mode of life, he opened a theater of his own. The revolution induced him to attempt a political career; but France, in spite of its discreditable admiration of this literary Cagliostro, had sufficient good sense to turn the cold shoulder to him. In 1853, "financial considerations" compelled him to seek refuge in Belgium. Subsequently, his pecuniary star being once more in the ascendant, D. visited the east. After the conquest of Sicily by Garibaldi in 1860, he followed in the wake of the great liberator, who does not seem, however, to have been imposed upon by his mountebank worship and bombastic enthusiasm.

It would require pages to enumerate all the productions which have been issued under the name of D.; but for two reasons, this is unnecessary: first, they are for the most part worthless, and second, they are for the most part not *his*. M. Alphonse Karr, in his *Mercantilisme Litteraire* (1845), and M. Eugène de Mirecourt, in his *Fabrique de Romans, Maison A. Dumas et Cie* (1845), have exposed the astounding quackery of this writer. It would seem that D. had introduced the *sweating-system* into literature, for he had in his employment a large number of poor authors and literary hacks, whose circumstances or position hindered them from demanding a legitimate emolument for their labor. To these persons, D. was in the habit of giving a few brief outlines of a novel or drama, and then paid them for composing the work, which appeared as the production of D.'s miraculous pen. Thus it happened that D. sometimes contrived to issue more volumes in a year than it was possible for a human being to transcribe in the same period. His best known works are *Les Trois Mousquetaires* (8 vols., 1844), *Le Comte de Monte Cristo* (12 vols., 1841–45), *La Reine Margot* (6 vols., 1845). His *Mémoires,* commenced in 1852, only confirm the impression of his character which one derives from the perusal of his books. Altogether, it may be said that the appearance in literature of a writer like D. is a portentous phenomenon; and the avidity with which his immoral fictions are devoured, is the most severe condemnation of modern, and especially French, society that could well be pronounced. He died 5th Dec., 1870.—DUMAS, ALEXANDRE, or Dumas the younger, son of the preceding, who has unhappily followed in the footsteps of his father, was born at Paris, 28th July, 1824. His principal work is *La Dame aux Camélias* (2 vols., 1848), a novel on which is founded the notorious opera of *La Traviata.* It is perhaps the most audaciously immoral work in existence. The heroine is a prostitute, who, while following her avocation, contrives (in a manner known only to French novelists) to keep up an unsullied affection for a young gentleman, who is a compound of sentimentalism, imbecility, and lust. Among D.'s other works may be mentioned *Le Roman d'une Femme; La Dame aux Perles;* and several dramatic pieces. He was installed as a member of the French academy in 1875.

DUMAS, JEAN BAPTISTE, a distinguished French chemist, was b. at Alais, in the department of Gard, in 1800. He was at first apprentice to an apothecary in Geneva, and engaged in some scientific investigations that attracted the attention of Decandolle and Prévost. In 1821, he came to Paris, and was appointed chemical *répétiteur* (tutor) in the polytechnic school, and then professor of chemistry in the athenæum. He was

afterwards removed to the Sorbonne, and made a member of the institute. His researches in organic chemistry, on atomic weights, sulphuric ether, and the law of "substitutions," attracted attention over all Europe. D. is not merely an expert chemist, but an able and bold thinker, and eloquent expounder, who has the art of making science attractive, and of captivating his hearers. During the July monarchy, he was a member of the council of education. After the revolution of Feb., he was chosen a member of the legislative assembly; and from 1849 to 1851, he held the portfolio of agriculture and commerce. After the *coup d'état*, he was made a member of the senate and of the superior council of public instruction, of which he is at present vice-president. Numerous contributions from his pen are contained in the *Annales de l'Industrie* and other scientific journals, and in the *Mémoires de l'Académie*. His chief works are *Traité de Chimie appliquée aux Arts; Leçons sur la Philosophie Chimique; Essai sur la Statique Chimique des Êtres Organisés*, etc. D. delivered the first Faraday lecture before the London chemical society, in 1869. He was elected a member of the French academy in 1876.

DUMAS, MATTHIEU, Count, 1753–1837; a French soldier and military historian. He entered upon active service in the army in 1780 as aid to Rochambeau, commander of the French force sent to the aid of the Americans then in revolt against England. He was in a number of engagements, including the capture of Yorktown. After peace, he returned to France. In the revolution of 1789, he acted with Lafayette and the constitutional liberal party. In 1791, he was elected to the assembly, and the next year was chosen president of that body. During the reign of terror he absented himself from France, with some brief intervals. In 1797, he was proscribed as a monarchist, and fled to Holstein. When Bonaparte became first consul he was recalled, and appointed chief of staff to the army of Dijon. He was subsequently councilor of state, and grand officer of the legion of honor, whose organization he defended before the corps legislatif. He went with Joseph Bonaparte to Naples, and was made minister of war. In 1808–9, he served in the French army in Spain and Germany, and after the battle of Wagram he was employed in negotiating the armistice. He was intendant-general of the army in the Russian campaign, an office which involved the charge of the entire administrative department. He shared the horrors of the retreat from Moscow, took part in the battles of Lutzen and Brantzen, and after the defeat at Leipsic was employed to negotiate the capitulation; but his terms were not accepted by the allied powers, and he was arrested and imprisoned until the conclusion of peace in 1814. He was in favor under the temporary restoration, and held important commissions. When Napoleon returned from Elba, Dumas was intrusted with the organizing of the national guards. This put him out of favor with the Bourbons, and when Louis XVIII. was finally restored, he was obliged to retire on half-pay. He then finished his review of military events, in 19 vols., embracing the history of the war from 1798 to 1807. In 1818, he was restored to favor, and made a member of the council of state; in 1828, he was a deputy in the assembly from Paris. After the events of 1830, he was made a peer, and re-entered the council of state as president of the war committee.

DUMB. See DEAF AND DUMB.

DUMB AGUE, a common name, although not unscientific, of masked ague, or a form of intermittent fever, in which the prominent symptoms, as the shaking chill, and the succeeding violent fever, are not present, or the tendency to them only slightly indicated. It is sometimes applied, though erroneously, to a much more serious and dangerous form, called pernicious, malignant, or congestive intermittent fever. See INTERMITTENT FEVER.

DUMBARTON, a royal, parliamentary, and municipal burgh, seaport, and chief town of Dumbarton co., is situated mainly on the left bank of the Leven, near its junction with the Clyde, and 15 m. w.n.w. of Glasgow. It is rather closely built, and chiefly consists of a long semicircular street, parallel to the river. The chief branches of industry carried on in the town of D. are ship-building, marine-engine and machine making, iron-forging, iron and brass founding, and rope-making. It has regular steam-communication with Glasgow, Greenock, and other Clyde ports. Pop. '71, 11,404. It unites with Kilmarnock, Renfrew, Rutherglen, and Port Glasgow in sending one member to parliament. D. is supposed to have been the Roman station Theodosia, and the capital of the kingdom of the Britons, on the vale of the Clyde. Alexander II., in 1222, made it a royal burgh. To the e. of the alluvial plain, at the mouth of the Leven, stands the famous and picturesque castle of Dumbarton, on a steep, rugged, basaltic rock, rising to the height of 560 ft., a mile in circuit at the base, and forming nearly an island at high water. The rock almost hides the town of D. from the Clyde. The fortress, composed of houses and batteries, studded over the rock, is of considerable historical interest. The rock is accessible only at one part, which is fortified by a rampart. The castle has been often besieged. A huge two-handed sword, said to be that of Wallace, is shown here. D. gave the title of earl of Dumbarton to a cadet of the house of Douglas, and commander of a regiment in the royal cause during the troubles in Scotland in the reigns of Charles II. and James II.; the popular song, *Dumbarton's Drums beat bonny, O*, has reference to this personage, who died in exile after the revolution.

DUMBARTONSHIRE (anciently, Lennox, Levenax, or Leven's field), a sickle-shaped co. in the w. of Scotland, bounded e. by loch Lomond, Stirling, and Lanark; s. by Renfrew and the Clyde estuary; w., by loch Long and Argyle; and n., by Perth. It is 35 m. long, and 15 (average 7½) broad, with 35 m. of coast; area, 297 sq. miles. On the e., it has a detached part of 12 sq.m., inclosed by Stirling and Lanark. The s. coast on the Clyde is mostly low and sandy. Loch Long forms 20 m. of the w. border. The Gare loch, one mile broad and 6 long, forms, with loch Long, the Roseneath peninsula in the s.w., studded with beautiful villas. Loch Lomond for 24 m. bounds the e. side of the co., the hills rising from a low, narrow, and wooded shore. Here is the romantic scenery of part of Rob Roy's country described by Scott. The n. of the co. is mountainous or hilly, rising in Ben Voirlich 3,300 ft. The scenery of D. is very romantic, and the co. forms the route to the w. highlands of Argyle and Perth. The ancient ferry from the lowlands to the highlands was between port Glasgow and Cardross. There are many streams, and 9 fresh water lakes, the largest being loch Lomond. The chief rivers are the Clyde, along the s. border; and the Leven, the outlet of loch Lomond, and running 6 m. into the Clyde, at the foot of Dumbarton rock. The rocks are mica-slate, talc-slate, clay-slate, trap, coal-measures, and carboniferous limestone. The mineral products are coal, freestone, limestone, ironstone, and slates. The climate is mild and humid. The arable lands lie chiefly s. of loch Lomond, and along the Clyde e. and w. of Dumbarton castle. On the hills are reared highland cattle and black-faced sheep, and on the plains Ayrshire cattle and Cheviot sheep. In 1875, 45,674 acres were under crops and grass, the chief crops being oats, turnips, barley, wheat, beans, and potatoes. D. has extensive and valuable woods. The chief branches of industry are ship-building and marine-engine making, and bleaching, calico-printing, and dyeing; there are also iron-foundries, breweries, tanneries, and rope-yards. D. is divided into 12 parishes. There are about 70 churches, Established, Free, and United Presbyterian. Pop. '71, 58,659: valuation of the co. in 1877–78, £304,240. D. sends one member to parliament. A portion of the Roman wall of Antoninus runs through the s.e. corner of the co., and ends at Kilpatrick. At Luss is the cairn of St. Kessock, a martyr in 520. There are remains of Roman forts, and of a Roman bridge at Duntocher. Stone coffins and Roman vases and coins have been found.

DUMB CANE, *Dieffenbachia seguina,* formerly called *arum seguinum* and *caladium seguinum,* a plant of the natural order *araceæ,* remarkably differing from the plants of that order generally in its almost arborescent character, but agreeing with them in its acridity, which is in none of them more highly developed. It has a cylindrical stem, with ringed scars and oblongo-ovate leaves. It is a native of the West Indies, and has received its English name from the property which it has of producing dumbness when chewed, its acrid poisonous juice causing an immediate swelling of the tongue, accompanied with excruciating pain. The juice is, however, sometimes used to effect the granulation of sugar. A decoction of the stem is used as a bath and fomentation in dropsy, and the root-stock is used in obstinate constipation.

DUMBNESS. See DEAF AND DUMB.

DUMDUM, the name of a t. and of a valley in India.—1. The town is well known in the military history of the country, standing in lat. 22° 38′ n., and long. 88° 30′ east. It is 10 m. to the s.e. of Barrackpore, and 8 to the n.e. of Calcutta, having extensive accommodations for troops, and a cannon-foundry. The place is famous in connection with the mutiny of 1857, as the scene of the first open manifestation on the part of the Sepoys against the greased cartridges.—2. The valley leads into Cashmere from the s. over what is called the Pir Panjal pass, whose crest is 11,800 ft. above the level of the sea. It is about lat. 33° 45′ n., and long. 75° east.

DUMFRIES', a royal, parliamentary, and municipal burgh, river-port, and county-town of Dumfriesshire, on the left bank of the Nith, 9 m. from its mouth in the Solway firth, 73 m. s. by w. of Edinburgh, and 33 w.n.w. of Carlisle. It stands on a rising ground, surrounded, except towards the sea, by fine, undulating hills, many of which are green to the top. It is an irregularly built town of red freestone, and is reckoned the capital of the s. of Scotland. Two bridges cross the Nith to Maxwelltown, a suburb in Kirkcudbright. One of the bridges is believed to have been built about 1280, by Devorgilla, the mother of John Baliol, and to have had 9 arches, although some antiquaries claim 13, with a central gate. It is largely, however, a structure of the 17th c.; only six of its arches now remain; and it is limited to foot-passengers. The most noticeable building in D. is the mid-steeple, in the center of the High street, which was at one time believed to have been erected by Inigo Jones; the architect is now, however, ascertained to have been Tobias Bachup, of Alloa. The very high tides of the Solway firth bring vessels of 40 tons up to the town, and larger ones to the river quays below the town. In 1875, 496 vessels of 25,675 tons entered, and 306 of 19,106 cleared the port. D. has three large and two small manufactories of woolen cloths (Tweeds); it manufactures hosiery, leather, baskets, and wooden shoes; and it has a considerable reputation for its dye-works, and the nurseries in its vicinity. The chief exports are woolen cloths, wool, hosiery, shoes, sheep, grain, wood, and bark. D. is noted for its markets, live-stock being here transferred from Scotch to English dealers. Pop. 71,

15,435. It unites with Annan, Sanquhar, Lochmaben, Kirkcudbright, and its suburb, Maxwelltown, in sending one member to parliament. D. arose, it is believed, in a castle, of which nothing now remains. The early Scotch and English kings had frequent contests for its possession. About 1200, a monastery was founded here, in the chapel of which Comyn (q.v.) was stabbed by Robert Bruce in 1305. The Highlanders, under prince Charles, in 1745, fined D. £4,000, and plundered and burned it. Burns spent the last years of his life here as an exciseman, and the house he resided in, and the mausoleum erected to his memory, are among the most notable objects of the place.

DUMFRIESSHIRE, a border co. of Scotland, on the Solway firth, having Kirkcudbright on the west. It forms an irregular ellipse, 55 m. by 32, with 22 m. of coast-line on the Solway firth, to which its surface slopes; area, 1103 sq.m., or 705,946 acres. The n. half is mountainous, rising, in Hartfell, 2,650 ft.; Lowther Hills, 2,522; Black Lark, 2,890; Ettrick Pen, 2,258; and Queensberry, 2,259. The s. part is undulating. The country on the Solway firth (q.v.) for 10 m. inland is flat, sandy, and gravelly, with tracts of "cobbles," or large stones. D. is drained principally by three rivers—the Nith, 45 m. long; the Annan, 40; and the Esk, 40; which run s.e. and s. into the Solway firth from the n. border of the co., and divide it into three districts or dales, called after the rivers. There are many small lochs, three of them near Lochmaben, containing vendace. D. consists of Silurian, permian, and carboniferous strata, with eruptions of trap. Tortoise footprints have been found in the new red sandstone of Annandale, at Corncockle. The mineral products are coal, limestone, ironstone, lead, and silver. There are extensive lead-mines at Wanlockhead, 2 m. from Leadhills, in Lanarkshire. Gold has been obtained in quartz veins in the hills near Wanlockhead; a mass of 5 ozs. found there is now in the British museum. There are noted sulphureous springs at Moffat, and chalybeate ones at Hartfell. The climate is moist and mild, and most of the land has a southern exposure. There are rich alluvial tracts along the rivers and on the Solway firth. The Lochar Moss, a peat tract on the Solway firth, is 13 by 2 to 3 m., and contains shells, trees, and fragments of ships. The chief occupations are agriculture, and the rearing of cattle, sheep, and pigs. In 1875, there were 214,170 acres, or between one third and one fourth of the co., under all kinds of crops. Of these, 49,710 were under corn crops, and 25,379 under green crops. Sheep-farms occupy the hills. The chief exports are cattle, sheep, grain, wool, hams, and bacon. There are fisheries of salmon in the rivers. In 1871, D. had 74,808 inhabitants; 12,672 children between 5 and 13 years of age in receipt of education. D. sends one member to parliament. The co. abounds in antiquities. D. formed part of Valentia in Roman times, and subsequently of the kingdom of Strathclyde.

DÜ'MICHEN, JOHANNES, b. Silesia, 1833; studied at Berlin, and turned his attention to Egyptian archæology. He made several trips to that country, and made some remarkable discoveries concerning the temple of Denderah. He has written nearly a dozen works on Egyptian and other archæology.

DUMMER, JEREMIAH, 1680–1739; b. Boston; graduated at Harvard; studied theology and spent some years in the university of Utrecht. He was in England as one of the agents of Massachusetts, and became familiar with Bolingbroke, some of whose views, it is thought, he adopted. He published a *Defense of the New England Charters*, and some less important works. His brother, WILLIAM, 1677–1761, lieutenant governor, founded the Dummer academy at Newbury, Mass.

DUMMOW', a t. of India, in the division of Jubbulpore, Central Provinces, stands in lat. 23° 50′ n., and long. 79° 30′ e., being 775 m. to the westward of Calcutta. It has a large bazaar, and is abundantly provided with wells. Its *district* has an area of 2,800 sq.m., and a pop. of (1872) 269,642; the town, of 8189. D. is also spelt *Damoh*.

DUMONT, PIERRE ETIENNE LOUIS, an able propagator of the Benthamite philosophy, was b. at Geneva, 18th July, 1759, studied theology, and after officiating as a minister for a short time in his native town, proceeded to St. Petersburg in 1783, where he accepted the charge of the French Protestant church. In 1785, he left Russia, went to England, and became tutor to the sons of lord Shelburne, afterwards marquis of Lansdowne. His superior talents, liberal sentiments, and fine character, soon recommended him to the illustrious whigs of that period; with sir Samuel Romilly, in particular, he formed a close friendship. During the early years of the French revolution, D. was at Paris, where he became greatly attached to Mirabeau, regarding whom he has given the world much important information in his *Souvenirs sur Mirabeau et sur les deux Premières Assemblées Législatives* (which were not published till 1832, seven years after the author's death). From this work, it appears that D. wrote many of the best articles and speeches attributed to Mirabeau. In 1791, D. returned to England, and formed an intimacy with Bentham. This was certainly the most important event in his life. Deeply convinced of the value of that philosopher's views of legislation, he requested his friend to allow him to arrange and edit his unpublished writings on this subject. Bentham gave him his manuscripts. D. labored earnestly to abridge, elucidate, correct, and simplify what he had received. The results appeared in his *Traité*

de Législation Civile et Penale (Geneva, 1802); *Théorie des Peines et des Récompenses* (Geneva, 1810); *Tactique des Assemblées Législatives* (Geneva, 1815); *Preuves Judiciaires* (Geneva, 1823); and the *Organization Judiciaire et Codification* (1828, a posthumous work). D. returned to Geneva in 1814, and became a member of the representative council. In this office he found many opportunities of putting the principles of Bentham into practice, and thus greatly benefited his native city. He died in 1825, at Milan.

DUMONT D'URVILLE, JULES SÉBASTIEN CÉSAR, 1790–1842; native of Normandy; a French navigator. He was self-taught, mastering botany, entomology, and a number of modern and ancient languages. In 1820, while on a surveying trip in the Mediterranean, he was so fortunate as to recognize in a Grecian statue just unearthed the Venus of Milo, and to secure its preservation. In later years, he was concerned in explorations around the Australian continent, New Zealand, Van Dieman's Land, and other Pacific and Indian islands. In 1830, he transported the exiled Charles X. to England. His next and most important venture was in antarctic exploration. He sailed in Sept., 1837, with two vessels. In Jan., 1838, they reached the antarctic ice, along which they coasted to the e. for 300 miles. Turning w., they visited the South Orkneys, the New Shetlands, and discovered Joinville land and Louis Philippe's land; but sickness compelled them to run to Chili. Thence they crossed the Pacific, visiting the Fiji and Pelew islands, New Guinea, and Borneo. In 1840, they returned to the antarctic region, and discovered Adélie land. In Nov., he arrived at Toulon. D'Urville was at once appointed rear-admiral. In 1842, he was killed, with his wife and son, in a railway accident. His works on natural history, and especially his collections, are valuable.

DUMOURIEZ, CHARLES FRANÇOIS, a French gen., was b. at Cambrai, 25th Jan., 1739, entered the army in 1757, and served in Germany during the seven years' war. On the conclusion of hostilities in 1763, D., who possessed a restless, adventurous genius, went from one country to another, seeking active employment. Under Louis XVI., he held the office of commandant of Cherbourg, where he commenced the formation of a great naval establishment. As the revolution drew on, D. began to attach himself more closely to the popular party. In 1790, he became connected with the Jacobin club, and during the same year was appointed military commandant of lower Normandy. After holding for a short time the office of minister of foreign affairs, he became lieut.gen. in the army of the north, commanded by maréchal Luckner. The allies were advancing in great force. By a series of bold and rapid maneuvers, D. prevented his enemies from sweeping over the plains of Champagne, and finally took up his position at Grand-Pré. Succors quickly arrived, and the victory of Kellermann at Valmy compelled the invaders to retreat. It is generally admitted that by his admirable strategic movements at this critical period D. saved France. A winter campaign in Belgium followed, and on the 5th and 6th Nov., 1792, D. overthrew the Austrians under the duke of Sachsen-Teschen and Clairfait at Jemappes. The campaign of 1793, which aimed at the complete conquest of the Netherlands, was opened with the siege of Maestricht; Breda and other places were taken by the French; but at Neerwinde, D. sustained a severe defeat from the Austrians under Coburg. D.'s Jacobinism had been cooling for some time, on account of the anarchy prevailing at Paris, and when commissioners were sent to remonstrate with him on account of his monarchical leanings, he told them nothing could save France from the horrors of anarchy but a constitutional monarchy; D. then entered into secret negotiations with Coburg, evacuated Belgium, and promised to exert himself on behalf of the Bourbon family. He was now accused of being a traitor, by the authorities of Paris; but when requested by the commissioners to proceed to the capital, and stand his trial, he answered by handing over the representatives of the people to the Austrians. He next endeavored, but in vain, to win the army over to his plan of marching upon Paris, and re-establishing the royal authority, and D. had to take refuge, accompanied by the duc de Chartres, in the ranks of the enemies of France. The convention set a price of 300,000 francs upon his head. After wandering through many countries of Europe, he finally settled in England, where he died an exile at Turville park, near Henley-upon-Thames, 14th Mar., 1823. Besides a multitude of pamphlets, D. wrote *Mémoires du Général Dumouriez* (Hamburg, 1796), and *La Vie et les Mémoires du Général Dumouriez* (3d edit., Paris, 1822–24).

DUMPY LEVEL, a leveling instrument for short distances. It has a short telescope with large field, and the compass is fixed underneath.

DUN, a root common to the Celtic and Gothic languages, signifying a hill or height. Besides giving rise to the Fr. *dunes*, Ger. *dünen*, Eng. *downs* (q.v.), it enters extensively into the names of places (becoming often *dum, don*), as *Dun*kirk, *Dum*barton, *Don*egal. It is allied to the Ang.-Sax. *tun, ton*, whence *town* (q.v.).

DÜ'NA, DWI'NA, or DVI'NA, the name of a river of Russia, which rises in the government of Tver, in the neighborhood of the source of the Volga, and flows w.s.w. in a course almost parallel to that of the Dnieper. At Vitebsk, the D. turns to the w., then to the n.w., and advances in that direction toward its debouchure in the gulf of Riga,

passing the towns of Disna, Drissa, Dünaburg, Jacobstadt, and Riga. The entire length of the D. is about 650 miles. It is navigable from Dünamunde, at its mouth, to Velij, on the border of the government of Smolensk—a distance of 400 m.; but the navigation, owing to its shallows, its rock obstructions, and sand-banks, is extremely difficult and dangerous, except during the spring and autumn floods. The basin of the D. is estimated at 28,350 sq. m.; at Riga, its breadth is 2,400 feet. In the spring, the surface of the D. is covered with rafts and planks, which are floated down from the forests of the provinces through which it flows. Its waters, which abound in fish, are connected with those of the Dnieper by means of the Beresina canal, which thus connects the Black sea and the Baltic. See also DWINA, NORTHERN.

DÜNABURG, a strongly fortified t. of western Russia, is situated on the Düna, in the government of Witebsk. It is of great military importance, owing to the strength of its fortifications. It has three fairs in the course of the year, and considerable trade. Pop. '67, 29,613. D. was formerly the capital of Polish Livonia.

DUNBAR, a royal, parliamentary, and municipal burgh, and very ancient seaport and t. in the n.e. of Haddingtonshire, on an eminence at the mouth of the firth of Forth, 29 m. e.n.e. of Edinburgh. The coast near D. consists of basaltic rocks and islets, and gives fine views of the Bass rock, the isle of May, and Fifeshire. D. is a fine old town. It has a sailcloth and cordage manufactory, a paper mill, and extensive tile-works, breweries, etc., but the chief industry is the fisheries, in connection with which there are large curing establishments. The old harbor is impeded at the entrance by craggy islets and sunken rocks, but is accessible to vessels of 300 tons. About the year 1840, an additional harbor, called the Victoria harbor, was erected at D., at the expense of the fishery board and town; with recent important repairs and improvements, it has cost altogether upwards of £50,000. It has 4 ft. at low water, and is considered one of the best suited for fishery purposes in the country. From 4,000 to 5,000 tons of herrings are annually exported from D., besides what are used for local consumption. The other exports are chiefly corn and potatoes. Pop. '71, 3,311. D. unites with North Berwick, Jedburgh, Haddington, and Lauder in sending a member to parliament. On the high rocks at the entrance to the new harbor are a few fragments of the ruins of a castle, which, from the end of the 11th c., was the chief seat of the ancient earls of March. It was once very strong, and an important security against English invasions: Edward I. took it, and Edward II. fled thither after the battle of Bannockburn; it was demolished in 1333, and rebuilt in 1336; it was successfully defended in a siege of six weeks against the earl of Salisbury by Black Agnes, countess of Dunbar, in 1338; it sheltered queen Mary and Bothwell in 1567; and in the same year it was destroyed by the regent Murray. In 1650, Cromwell, at the "Race of Dunbar," defeated the Scottish army under Leslie.

DUNBAR, WILLIAM, the greatest of the old Scottish poets, is supposed to have been born about 1460. In 1475, he went to St. Andrews, where, in 1477, he took the degree of B.A., and in 1479, that of M.A. Considerable obscurity rests upon his career for about twenty years after he left the university. From his own writings, we learn that he entered the order of St. Francis, and was employed for some time as an itinerant or preaching friar. In that capacity, he "ascended the pulpit at Dernton and Canterbury, and crossed the sea at Dover, and instructed the inhabitants of Picardy." He appears to have entered the king's service, and to have been retained as "clerk" or secretary to some of James's numerous embassies to foreign courts. In 1500, he obtained from the king a yearly pension of £10. In 1501, he visited England, in the train, as his biographers suppose, of the ambassadors sent thither to conclude the negotiations for the king's marriage. On the 9th May, 1503, three months before the queen's arrival, he composed in honor of the event his most famous poem, the *Thrissil and the Rois*. He seems now to have lived chiefly about court, writing poems, and sustaining himself with hope of preferment in the church. On the 17th Mar. 1504, he received a gift for saying mass for the first time in the royal presence. At Martinmas, 1507, his pension was doubled, and three years afterwards, it again received augmentation. He is supposed to have visited the northern parts of Scotland in May, 1511, in the train of queen Margaret. After the ruinous defeat at Flodden, and the confusion consequent on the king's death and a prolonged regency, D.'s name disappears altogether. He is supposed to have died about 1520.

As a poet, he possessed a wonderful variety of gifts; his genius comprised the excellences of many masters. He is at times as rich in fancy and color as Spenser in the *Faery Queen;* as homely, and shrewd, and coarse as Chaucer in the *Miller's Tale;* as pious and devotional as Cowper in his *Hymns;* and as wildly grotesque in satire as Burns in his *Death and Doctor Hornbook*. When Scott read portions of his works to Crabbe, in Edinburgh, the latter remarked that, "before the Ayrshire plowman, Scotland possessed at least one great poet." A complete and carefully elaborated edition of D.'s works, by Dr. David Laing, was published at Edinburgh in 1834.

DUNBLANE, a city and burgh of barony in the s. of Perthshire, picturesquely situated on the left bank of the Allan, on the Scottish Central railway, 28 m. s.w. of Perth, and 5 n. of Stirling. It takes its name from St. Blane, a bishop of the 7th or 8th c., said to have been born in Bute. It mainly consists of one street of old-fashioned

houses. Pop. '71, 1921. The cathedral of D., chiefly in the first-pointed or early English style, about the year 1240, is now in ruins, except the choir, used as the parish church, 80 by 30 ft., with a tower 128 ft. high, the first four stages of which are Romanesque work of about the year 1140. The prebendary stalls of richly carved oak still remain. Of the bishops of D., by far the most celebrated was Robert Leighton, who held the see from 1661 till 1672, when he was translated to Glasgow. A path near the river, which he is said to have frequented, still bears the name of "The Bishop's Walk;" and the library which he bequeathed to his diocese, is still kept in the town. Two m. from D. was fought, in 1715, the indecisive battle of Sheriffmuir, between the royal forces, under the duke of Argyle, and the troops of the pretender, under the earl of Mar. D. once had an ancient Culdee monastery.

DUNCAN, ADAM, Viscount, a celebrated British admiral, was b. in 1731 at Dundee, entered the navy as midshipman in 1746, became lieut. in 1755, and in 1761, commander of the *Valiant*, of 74 guns, which took part in the expedition to Havana under admiral Keppel. In 1789, he was appointed rear-admiral of the blue, and in 1793, vice-admiral of the blue, but had little opportunity of distinguishing himself, and was even meditating, it is said, retiring altogether from the service, when he was appointed to the command of the united English and Russian squadron in the North sea, with the special design of watching the movements of the Dutch fleet—Holland and France being then both at war with England. D.'s blockade of the Texel was one of the most effective ever made, and the Dutch trade was almost ruined. During the blockade, a mutiny took place among the seamen, and D.'s position was for some time very critical, but the insubordination was ultimately quelled. Although weakened by the recall of the Russians, he gained a brilliant victory over the Dutch near Camperdown, 11th Oct., 1797, where he took the Dutch admiral, De Winter, prisoner. D. was rewarded with a pension of £2,000, and raised to the peerage, with the title of viscount. In 1799, he was promoted to the rank of admiral of the white, and died 4th Aug., 1804, after having inherited the family estates in Perthshire, on the death of his brother.

DUNCAN, THOMAS, R.S.A., and A.R.A., was b. at Kinclaven, Perthshire, May 24, 1807; and died at Edinburgh, 25th May, 1845. He studied in the Trustees' academy, under sir William Allan; was his successor as head-master of that school, and one of the most distinguished members of the royal Scottish academy. His portraits, and historical and fancy subjects, evince delicate feeling for female beauty, and keen appreciation of the humorous in Scottish character. The drawing is always careful and correct, and the coloring remarkable for clearness and delicacy. Though he exhibited but few pictures in the royal academy of London, they at once attracted marked attention, and he was elected an associate of that body in 1843. The principal works he exhibited there were: "Anne Page and Slender;" an illustration from the ballad of *Auld Robin Gray*, now in the Sheepshanks gallery, South Kensington; "Prince Charles's Entry into Edinburgh after the Battle of Prestonpans"—and the same prince, when a fugitive, concealed in a cave. He had now entered on a most successful career, and was engaged on the studies for two important works: "Wishart Dispensing the Sacrament on the Day of his Martyrdom;" and a large picture for the marquis of Breadalbane, "Queen Victoria at Taymouth," when he was seized with an illness which terminated fatally. One of his latest works was a portrait of himself; it is now in the national gallery of Scotland, and is an excellent specimen of careful drawing, united to great power of color and effect. That D. was remarkable for energy and industry, is proved by the number and high quality of the works he executed, though he died at the early age of thirty-eight. His portraits, especially those of ladies and children, will always hold a high place. Though constantly engaged on fancy subjects, he every year exhibited a very considerable number of portraits. In addition to the works above referred to, the following is a list of the principal historical and fancy subjects exhibited by him in the royal Scottish academy—1829: "The Death of Old Mortality," and "A Milk-girl." 1830: "The Braw Wooer," and "Children and Rabbit." 1831: "Lucy Ashton," and finished sketch of "Jeanie Deans and the Robbers." 1832: "Girl with Flowers." 1834: "Cuddie Headrig Visiting Jenny Dennison." 1835: "Mary Queen of Scots compelled to Sign her Abdication." 1836: "A Covenanter," and "Old Mortality Renewing the Inscription on a Tombstone." 1838: "The Secret Chamber—Isaac of York Visiting his Treasure," "The Lily of St. Leonards," and "The Friends." 1839: Study of "A Highland Stag, with Dead Game and Fruit." 1845: "The Martyrdom of John Brown of Priesthill, 1685." 1846: The finished sketch of "Wishart Dispensing the Sacrament on the Day of his Martyrdom, Mar. 1, 1546," was exhibited after the artist's death.

DUNCANSBY HEAD (the *Berubium* of Ptolemy), a promontory forming the n.e. extremity of Caithness, in lat. 58° 39′ n., and long. 3° 1′ w., and one mile and a half e. of John o' Groat's house. In the vicinity are deep long chasms or *ghoes*, in the Devonian strata, and curious detached sandstone columns in the sea called *stacks*. One of the chasms is 300 yards long, 12 to 15 wide, and 100 ft. deep, and communicates with the sea by three openings, one of which is arched. The horizontal beds of the sides of the perpendicular gullies look like ruined walls.

DUNCIAD, THE, by Alexander Pope, was published in 1728, in three books; and to these, in 1742, a fourth book was added. Pope had been, during the greater part of his career, afflicted by a host of critics and detractors. His own genius had not been spared; the worst motives, personal and literary, had been imputed to him; and he resolved to mete unto his enemies the measure which had been meted unto himself. Hence the origin of *The Dunciad*. Never was chastisement more complete. On its publication, a universal howl of rage and pain arose. The satire conferred immortality on his opponents. Pope was a good hater, and his hatred and contempt defy the tooth of time more completely than all the balsams of the Pharaohs.

DUNCKER, MAXIMILIAN WOLFGANG, b. Berlin, 1811; graduate and professor at Halle. He was a member of the Frankfort parliament, and of the Prussian diet. In 1861, he was councilor to the crown prince, and in 1867, director of the Prussian archives. His chief work is a *History of Antiquity*.

DUNCOMBE, THOMAS SLINGSBY, an English politician, nephew of first lord Feversham, was b. 1796. He was elected M.P. for Hertford in 1824, assisted in carrying the reform bill, and became a prominent member of the extreme liberal party. In 1832, he was rejected at Hertford; but in 1834 he was returned for Finsbury, which seat he retained in the parliament which assembled in 1859. In 1842, he presented the Chartist petition, signed by 3,000,000 of the lower classes in favor of universal suffrage, vote by ballot, short parliaments, etc. In 1842, the then home secretary, sir James Graham, having sanctioned the opening of the letters of Mazzini, D. stood up in the house of commons and denounced, with bitter and scathing invective, the adoption of the post-office spy-system on English soil. He was an earnest advocate of Jewish emancipation; and his motion in 1858 for placing baron Lionel Rothschild on a committee of the house of commons, was soon followed by the concession, by the latter chamber, of the right of Jewish members to sit in the house of commons. He died Nov. 13, 1861.

DUNDALK, a parliamentary and municipal borough and seaport, the capital of the county of Louth, Ireland, is beautifully situated at the mouth of the Castleton river, 50 m. n. of Dublin. It is overlooked on the n.e. by the Carlingford mountains. Vessels drawing 16 ft. can enter the harbor. D. has manufactures of tobacco, soap, leather, starch, and salt; steam flour-mills; considerable fisheries; a distillery, brewery, and a flax-spinning mill. The chief imports, especially from Liverpool, are groceries, timber, coal, iron, slates; and the exports, flax, linen, and all sorts of agricultural and dairy products and live-stock. D. is the chief outlet for the produce of the counties of Louth, Monaghan, and Cavan. Pop. '71, 11,327, of whom 8,969 were Roman Catholics, and 1803 Episcopalians. It sends one member to parliament. It has the remains of a Franciscan friary and a Druids' circle. The last king of all Ireland was crowned here. Edward Bruce took D. in 1315, and held his court here till killed in battle at Faughart, in the vicinity, in 1318. D. was captured by the Irish in 1641, by Cromwell in 1649, and by Schomberg in 1689. In 1875, the borough rates were £1261; the harbor revenue, £8,561. In 1875, 870 vessels of 151,251 tons entered, and 366 of 99,543 tons cleared the port. DUNDALK BAY is 8 m. broad by 7 deep, and with 4 to 6 fathoms water in the middle. It receives the Fane, Dee, and Castleton rivers.

DUNDAS'. 1. A castle and manor on the s. bank of the firth of Forth, near South Queensferry; the castle is a square tower of the 15th c., with modern additions; the manor was the original seat of the distinguished family of D., to whose progenitor it was granted by the earl of March about the year 1150.—2. A town in the province of Ontario, Dominion of Canada, at the head of Burlington bay, at the w. of lake Ontario. Pop. '71, 3,135. It is a station on the Great Western railway, and has a number of mills and manufactories.—3. An island, belonging to Great Britain, situated on the n.w. coast of America, 40 m. n.e. of Queen Charlotte island. It has Dixon's Entrance (q.v.) on the w., and is separated by Chatham sound from the most southerly of the Alaskian islands.—4. A group of nearly 500 islets, all of coralline formation, lying off the e. coast of Africa, being about lat. 1° south. There is only one secure harbor.—5. A river flowing into Delagoa bay (q.v.).—6. A strait in North Australia, separating Melville island from Coburg peninsula, being 18 m. in breadth.

DUNDAS, a co. in Ontario on the St. Lawrence, intersected by the Grand Trunk railroad; pop. '71, 18,777.

DUNDAS (of Arniston), the name of a Scottish family singularly distinguished for legal and political talent. Sir James D., the first of Arniston, received the honor of knighthood from James VI., and was governor of Berwick. His son, sir James D., was appointed a judge of the court of session in 1662, and took his seat on the bench under the title of lord Arniston, but was soon after deprived of his office for refusing to abjure the "National and Solemn League and Covenant." He died in 1679. His eldest son, sir Robert D., who also rose to the bench, died in 1727. DUNDAS, ROBERT, the son of the preceding, was born 9th Dec., 1685; became a member of the faculty of advocates in 1709; and in 1717 was appointed solicitor-general for Scotland, an office which he filled with great ability in a period of much political confusion. In 1720 he was made lord advocate; and in 1722 was chosen to represent the county of Edinburgh in the British parliament, where he honorably distinguished himself by his attention to

Scottish affairs. When sir Robert Walpole came into power in 1725, D. resigned his office, when he was elected dean of the faculty of advocates. In 1737, he was raised to the bench, when, like his father and grandfather, he took the title of lord Arniston. On the death of lord president Forbes of Culloden, in 1748, he was appointed his successor. He died in 1753. As an advocate, D. was a powerful and ingenious reasoner, and though somewhat disliked on the bench, his ability was universally admitted.—DUNDAS, ROBERT, the eldest son of the preceding, was born 18th July, 1713, studied at Edinburgh and Utrecht, was admitted to the Scottish bar in 1738, and rose to be lord advocate (1754), and president of the court of session (1760). D. died at Edinburgh, 13th Dec., 1787.

DUNDAS, the Right Honorable HENRY, Viscount MELVILLE, and Baron DUNIRA, brother of the preceding, was b. in 1741, and educated at the university of Edinburgh. He was admitted a member of the Scottish bar in 1763. As a younger son of a pretty numerous family, his circumstances were rather straightened; but his assiduity, his large share of the family talent, and no doubt of the family influence, soon procured him advancement in his profession. He was successively appointed deputy-advocate and solicitor-general. In 1774, he was returned to parliament for the county of Edinburgh, and in the following year was appointed lord-advocate for Scotland. Two years after, he was made keeper of the king's signet for Scotland. D.'s career in parliament was highly successful, though not very creditable to his political consistency. Elected in opposition to ministerial influence, he soon allied himself with the party in power, and became a strenuous supporter of lord North's administration, being one of the most obstinate defenders of the war with the American colonists. When lord North resigned in 1781, D. continued to hold the office of lord advocate under the Rockingham ministry. On the question of the war with America, D. had been opposed to Pitt; but when the coalition ministry was formed by Fox and lord North, he passed over to the side of his old opponent, and became Pitt's ablest coadjutor. When Pitt returned to the helm of the state in 1784, D. was appointed president of the board of control. In 1784 he introduced a bill for restoring the estates in Scotland forfeited on account of the rebellion of 1745. In 1791, he was appointed principal secretary of state for the home department. He also held a great number of other offices, one of which, the treasurership of the navy, involved him some years after in much trouble. D.'s aptitude for business was undeniable. Many of the most important public measures originated with, or were directly promoted by him. Among such were the formation of the fencible regiments, the supplementary militia, the volunteer corps, and the provisional cavalry; in short, the whole of that domestic military force raised during the war consequent on the French revolution. When Pitt resigned in 1801, D. did the same. In 1802, under the administration of Mr. Addington, he was elevated to the peerage by the titles of viscount Melville and baron Dunira. In 1805, his lordship was accused of "gross malversation and breach of duty," while acting as treasurer of the navy. The trial commenced 29th April, 1806; but in spite of the splendid array of whig talent against him, D. was acquitted on all the charges. After this, however, he took little part in public affairs, spending the most of his time in retirement in Scotland. He died at Edinburgh, 27th May, 1811.

DUNDEE (Lat. *Tuodunum*, the "hill or fort on the Tay") a royal parliamentary and municipal burgh and seaport, in the s. of Forfarshire, on the left bank of the estuary of the Tay, here two m. broad, 10 m. from the entrance of that river into the sea, 50 m. n.n.e. of Edinburgh, 20 e.n.e. of Perth, and 14 s.e. of Forfar. In population, it is the third town in Scotland. It stands mostly on the slope between Dundee law (525 ft. high, composed of trap, and with traces of ancient vitrification) and Balgay hill and the Tay. The new streets are wide and well laid out. The most striking architectural features of the town are—the town hall, in the Roman Ionic style, with a spire 140 ft. high, erected by the "elder Adams," in 1734; the Albert institute and free library, in 15th c. Gothic, from designs by sir Gilbert Scott, recently erected at a cost of £30,000; the royal exchange, built in the Flemish pointed style of the 15th c., at a cost of upwards of £12,000, and opened in 1856; the eastern club house; the corn exchange, capable of containing 2,000 people; the infirmary; the justiciary and sheriff court buildings; the post-office; the high school; the town's churches, with the old tower, 156 ft. high, restored in 1873, under the charge of sir Gilbert Scott, at a cost of £7,000; St. Paul's Episcopal church, with a tower and spire 217 ft. high; St. Paul's free church, with a tower and spire 167 ft. high; and St. Enoch's free church, with two handsome towers; the Morgan hospital (opened 1868), erected and endowed at a cost of nearly £80,000, under the will of John Morgan, a native of Dundee, for the maintenance and education of 100 boys; and the new orphan asylum. D. has several public parks, one of which, the Baxter park, on a beautiful slope to the eastward of the town, is 37 acres in extent, and was presented by the late sir David Baxter, at a cost of £50,000; another, to the westward of the town, occupies the hill of Balgay, and is finely wooded and beautifully laid out, its extent being about 60 acres. D. is the chief seat in Great Britain of the manufacture of coarse linen fabrics (Osnaburgs, sheetings, ducks, dowlas, drills, canvass, and cordage). Manufactures of jute are almost exclusively carried on here. The consumption in D. of this material, which is grown in India, amounts to fully 120,000 tons annually. The raw material costs in D. a little over 2*d.* per lb. and the cloth made from it, reck-

oned by weight, is the cheapest textile fabric made in Great Britain. Of jute many varieties of fabric are made, from the coarsest nail-bagging to carpets of great beauty. This range includes packages for every species of merchandise, sacks for wool, coffee, guano, etc. The annual value of the flax, hemp, and jute manufactures in D. is upwards of £5,500,000. D. is also famous for its manufacture of confectionery, which is exported to all parts of the world. One firm uses 150 tons of bitter oranges annually in the manufacture of marmalade. D. is the center of the whale and seal fishing trade of Great Britain. Ship-building (both wood and iron) and machine-making are carried on to some extent. D. has magnificent harbors in addition to the tide harbor, several large wet docks, a graving-dock, and a slip for large vessels. The docks have been erected at a cost of upwards of £700,000. In 1875, 1450 vessels of 393,525 tons entered, and 869 vessels of 246,968 tons cleared the port. At the n. end of the mid quay stands the royal arch, in commemoration of her majesty's landing here in 1844. D. is well supplied with water. A little to the w. of D. one of the largest iron bridges ever constructed is being built across the Tay. It is to consist of 90 spans, some 245 feet long. Pop. '71, 118,977. D. sends two members to parliament. It was an important place in the 12th century. Edward I. was here in 1296 and 1303. Wallace is said to have taken the castle in 1297, and Bruce demolished it in 1313. The duke of Lancaster burned D. in 1385, and the marquis of Montrose pillaged it in 1645. Charles II. lived here, after his coronation at Scone, in 1650. On the refusal of D. to submit to Cromwell, gen. Monk, 1651, sacked and burned it, massacring 1000 citizens and soldiers, and filling 60 vessels with booty, which were totally wrecked on their voyage to England. D. was one of the first Scotch towns to adopt the reformation. Wishart the martyr preached here during the plague of 1544.

DUNDEE, VISCOUNT. See GRAHAM, JOHN.

DUNDONALD, THOMAS COCHRANE, Earl of, son of the ninth earl of Dundonald, was b. Dec. 14, 1775. He, while still a boy, entered the 104th regiment. At the age of 17, he joined the *Hind* corvette, commanded by his uncle, capt. sir Alexander Cochrane. In 1800, he became master and commander of the *Speedy* sloop-of-war, of 14 guns and 54 men; and in 10 months he took 33 vessels, carrying together 128 guns and 533 men, besides assisting in the capture of many others. D. received his post-rank, 1801, for the capture, by boarding, of *El Gamo*, a Spanish frigate of 32 guns, off Barcelona. In 1803, he was appointed to the *Arab*, 22, and served at the blockade of Boulogne. In 1804, he removed to the *Pallas* frigate, 32, and was sent out to assist his uncle, then employed in the blockade of Ferrol. He made several valuable prizes while cruising off the Spanish coast, among others the *Fortuna*, with specie to the amount of £150,000, besides merchandise, but generously returned 10,000 crowns to the Spanish capt. and supercargo. In 1806, he cut out the *Tapaguese* corvette, which lay in the Gironde, under the protection of two heavy batteries. He destroyed the semaphores along the French coast, and carried by storm the battery at Pointe l'Equilon, which he blew up. Being now transferred to *L'Impérieuse*, he took and destroyed, in the month ending Jan. 7, 1807, 15 of the enemy's ships, chiefly laden with wine and provisions. He was next sent to co-operate with the patriots on the coast of Catalonia, and contributed to the surrender of the castle of Mongat. After harassing the French coast, and destroying the semaphores on the coast of Languedoc, he volunteered for the defense of fort Trinidad, at Rosas, on the coast of Catalonia. At the head of 80 of his own men, and the same number of Spaniards, he repelled 1000 of the enemy in an assault made by them upon the castle. He protracted the siege for 12 days, then blew up the magazine, and returned to his ship. In April, 1809, he was selected by the admiralty for the daring and hazardous service of burning the French fleet then lying at anchor, and blockaded by lord Gambier, in the Basque roads. At night he went on board one of the fireships, containing 1500 barrels of gunpowder, and performed the service intrusted to him with characteristic intrepidity. He was rewarded with the knighthood of the bath. He had been chosen M.P. for Westminster in 1807, and his charges of incompetency against lord Gambier led to a court-martial upon that nobleman. Lord Gambier, after a partial trial, was acquitted, and the professional prospects of his assailant were ruined. During the rest of the war, the country lost the incalculable benefit of his services at sea, the navy gaining, on the other hand, such small advantage as could in those days be derived from D.'s protest in parliament against naval abuses. Early in 1814, he was accused of complicity in fraudulent stock-jobbing transactions. A rumor of the downfall of Napoleon having caused a sudden rise in the funds, D. and his friends were charged with having fraudulently propagated the rumor, and with having "sold out" to a large amount. He was found guilty of fraud, and was sentenced to pay a fine of £1000, to suffer a year's imprisonment, and to stand in the pillory. The latter part of the punishment was remitted, but he was deprived of the order of the bath, of his rank in the navy, and expelled from the house of commons. A new writ was issued for Westminster; but his constituents immediately re-elected him, notwithstanding his expulsion from the house; and his daring was shown by his escape from prison, and his re-appearance in the house. He represented Westminster until 1818, when, panting for a more active and eventful career, he drew his sword in defense of the independence of the South American colonies of Spain. The command of the fleet of the republic of Chili

was offered to him, and the terror of his name materially contributed to the success of the national cause. Valdivia, the last stronghold of the Spaniards, was captured by him. Another daring exploit was the cutting out of a large 40-gun frigate from under the guns of the castle of Callao, 5th Nov., 1820. The emperor of Brazil, Dom Pedro, afterwards gave him the command of the Brazilian fleet, and created him a marquis. In 1827 and 1828, he assisted in the Greek war of independence. In 1830, the whig administration of earl Grey came into office, and, believing him to have been the victim of a cruel and unjust persecution, hastened to restore him to his naval rank. In 1831, he succeeded to the earldom. In 1847, queen Victoria conferred on him the grand cross of the bath. He was also appointed commander-in-chief on the North American and West India station. In 1851, he was vice-admiral of the white, and in 1854, rear-admiral of the United Kingdom, a distinction which he held until his death. On his retirement from active service, he devoted himself to scientific inventions. He made improvements in poop and signal lights, and especially turned his attention to naval projectiles. He declared himself to be in possession of a means of annihilating an enemy's fleet, and during the Russian war offered to destroy Sebastopol in a few hours with perfect security to the assailants. His plans were, however, rejected. When upwards of 80 years of age, he published his autobiography—the record of a career almost unequaled even by British seamen for desperate service and dauntless exploit. He died Oct. 31, 1860, and was interred in Westminster abbey. In his naval expeditions, it was his fate to be constantly opposed to forces greatly superior to his own in numbers and metal. His inventiveness and fertility of resource under such circumstances have perhaps never been equaled. His daring would have been, in a man of less genius, the height of rashness, yet the almost unvarying success of his maneuvers and exploits attests his forethought, and his happy adaptation of slender means to the achievement of great ends and noble enterprises. In person, he was tall and broad built; and a slight stoop, contracted by service in the small sloops and corvettes of his early days, scarcely impaired a height of stature that might be described as commanding. His features were Scottish in character, and strongly marked, bearing in deep lines the traces of struggle, sorrow, and the wear and tear of an unusually long, active, and eventful life.—In 1877, a petition was presented to the queen, asking compensation to D.'s heirs for his 18 years' loss of pay and allowances as a naval officer—a petition which was ultimately granted.

DUNDRUM BAY, an inlet of the Irish sea, on the e. coast of Ireland, in the co. of Down, 5 m. to the s. of Downpatrick, is about 10 m. wide at its entrance, and forms a long curve into the shore, with a uniform breadth of about 2½ miles. Here, in 1846, the steamship *Great Britain* was stranded, but was got off in the following year without having suffered any very serious damage.

DUNE'DIN, the capital of the province of Otago, in New Zealand, is situated in lat. 45° 50′ s., long. 170° 36′ e., on the e. side of South island, towards its southern extremity. It is 200 m. by sea from Lyttleton, and 150 m. from Invercargill. Since its foundation by the New Zealand company, in 1848, the city has rapidly increased in importance; chiefly after the year 1861, when the discovery of extensive gold-fields in the neighborhood caused a sudden increase of population. For 3 years, the city, as well as the province, made great strides in wealth and prosperity; and although subsequently the excessive increase of population was checked by a decrease in the yield of gold, D. has ever since made steady progress. The population of the city proper was in 1874, 18,499, an increase of 3,642 since 1871; inclusive of the suburbs, the population is about 27,000. Within the last few years, the population has been increased by emigration from the colony of Victoria. D. is divided into four wards. It is as well laid out as the hilly nature of its site will allow; it is well paved, and lighted with gas. There are many handsome buildings—about a dozen of them churches; the First Presbyterian church, lately built, being one of the finest in the colony. D. is the seat of an Anglican and a Roman Catholic bishop. Other public buildings are the post-office, hospital, government buildings, mechanics' institute, etc.; and the inhabitants of the city possess places of recreation in the Vauxhall gardens, botanical gardens, and the grounds of the acclimatization society. Steamers sail regularly between D. and Melbourne; and railways are being constructed both to the n. and s., already extending to Invercargill, 110 m. to the south-west. Several daily and weekly newspapers are published. The principal articles of export are grain, potatoes, and wool—the last being by far the most important. The rapid extension of the wool traffic has indeed been marvelous. Between 1853 and 1859, the quantity exported had risen from 5,000 lbs. to 900,000. In 1873–74, it had increased to 15,797,779 lbs., valued at £959,451.

DUNES, from the same root as dun (q.v.), a hill, the name given to the sand-hills or mounds which stretch less or more along the sea-coast of the Netherlands and n. of France. These D. are a natural curiosity. "As if anxious to save the low countries from tidal inundation, nature has for centuries been energetically working to increase the magnitude of the mounds on the coast. At low-water, when the beach is exposed to the action of the winds from the German ocean, clouds of sand are raised into the air, and showered down upon the country for at least a mile inland; and this constantly going on, the result is, that along the whole line, from Haarlem to about Dunkirk or

Calais, the coast consists of sandy mounds of great breadth, partially covered with grass and heath, but unfit for pasturage or any other purpose, and these are the bulwarks which protect the coast. In some places, these D. look like a series of irregular hills; and when seen from the tops of the steeples, they are so huge as to shut out the view of the sea. The traveler, in visiting them from the fertile plains, all at once ascends into a region of desert barrenness. He walks on and on for miles in a wilderness such as might be expected to be seen in Africa, and at last emerges on the sea-shore, where the mode of creation of this singular kind of territory is at once conspicuous. Loose particles of sand are blown in his face; and as he descends to the shore, he sinks to the ankle in the drifted heaps. In some parts of these dreary solitudes, the sandy soil has been prevented from rising with the wind and injuring the fertile country, by being sown with the seeds of a kind of bent-grass, and in a few spots fir-trees have been successfully planted."—*Tour in Holland*, by W. Chambers. The English term *down* (q.v.) has a similar meaning.

DUNFERMLINE, a royal burgh in Fife, of the western district of which it is the chief town. It is the seat of the sheriff courts of the district, which are held twice a week during the session. The town is situated on a long swelling ridge, 3 m. from the firth of Forth, and 16 m. w.n.w. from Edinburgh. It stands 300 ft. above the mean level of the firth, and from the s. has an imposing appearance. The date of its origin is not known, but it was a place of note before the end of the 11th century. Here, king Malcolm Canmore and his queen, St. Margaret, between the years 1070 and 1093, founded an abbey for Benedictines brought from Canterbury. In 1303–4, Edward I. of England wintered here, the buildings being then described as capable of accommodating three kings and their suites. In 1588, D. was created a royal burgh by James VI. David II., James I. of Scotland, and Charles I., were born here; and Malcolm Canmore, his queen Margaret, Edgar, Alexander I., David I., Malcolm the maiden, Alexander III., Robert Bruce, his queen Elizabeth, and nephew Randolph, Annabella, queen of Robert III., Robert, duke of Albany, governor of Scotland, were buried in the abbey and its precincts. The tomb of Robert the Bruce was discovered at the building of the new church, which was opened in 1821. The skeleton of the king was disinterred, and a cast was taken of the cranium. Some interesting fragments of the ancient regal and ecclesiastical magnificence of D. still remain. What is called Malcolm Canmore's tower is a mass of shapeless ruins, but the s. wall of the palace of the Stuarts still exists, overhanging the romantic glen of Pittencrief, a noble wreck, with massive flying buttresses. Of the abbey, the frater hall or refectory, and a tower and arched gateway, still remain. The nave of the abbey church, consecrated in 1150, is in the Romanesque style, 106 ft. long, and 55 wide. The choir, built about 1250, a fine example of the first pointed style, was taken down in 1818–21, when it was replaced by what is now the parish church, surmounted by a square tower 100 ft. high, round which is the inscription, in open hewn capital letters, "King Robert the Bruce." The modern history of D. is chiefly remarkable in connection with the rise of Scottish dissent, Ralph Erskine and Thomas Gillespie having respectively been founders of the Seceder and Relief bodies, now joined under the name of United Presbyterians. The staple trade of the town is damask linen-weaving, which took its rise about the beginning of last century. There are establishments for the spinning of linen yarn, and several large factories where steam and hand loom weaving is carried on. There are likewise large collieries and lime-works, iron foundries, breweries, dye-works, and fire-clay works. See DAMASK. The public buildings are, town-house and county buildings, each having a spire, and the prison, poor-house, and music hall. There are eight fairs, a monthly cattle-market, and one weekly market for grain and country produce. Pop. of parish '71, 23,313, of which the town contains 14,963. It joins with Stirling, Inverkeithing, Queensferry, and Culross in returning a member to parliament.

DUNFISH, codfish cured so that they have a dark or dun color. They are split and partially salted, piled away in a dark place, covered with eel-grass, and pressed. The process gives them a peculiar flavor.

DUNGANNON, a parliamentary and municipal borough in the east of Tyrone, near a tributary of the Blackwater, 11 m. n.n.w. of Armagh, and 8 m. w. of lough Neagh. It lies on a hill-slope, in a densely peopled district, with high mountains to the west. It is well built, and consists of a square with diverging streets. In the vicinity are the largest lime-quarries and collieries in Ulster. The chief manufactures are linen, coarse earthenware, and fire-brick. Pop. '71, 3,886. It sends one member to parliament. It was the chief seat of the O'Neils, the kings of Ulster, till 1607. Its castle was destroyed by the parliamentary forces in 1641.

DUNGARVAN, a parliamentary and municipal borough, seaport, and bathing-place, Waterford co., Ireland, 25 m. w.s.w. of Waterford. The pop. in 1871 was 6,520, chiefly engaged in hake, cod, herring, and other fisheries. The chief exports are grain, butter, cattle, and fish. Vessels of more than 250 tons cannot discharge at the quay. D. has the remains of an Augustinian abbey, founded in the 7th c. by St. Garvan. It has besides the remains of walls built by king John, who also built the castle, now used as barracks.—Dungarvan bay is 3 m. wide, about the same in length, and 1 to 5 fathoms deep.

DUNG BEETLE, the common name of many coleopterous insects of the tribe *scarabæides*, which feed upon the dung of animals, and for the most part live in it. They are found in all parts of the world. Many of them belong to the section of *scarabæides* called *coprophagi* (Gr. dung-eaters); but others, as the DOR, or SHARD-BORN BEETLE (*geotrupes stercorarius*), to the section called *arenicoli* (Lat. sand-dwelling), distinguished by peculiarities in the antennæ, mandibles, etc. Neither section, however, consists exclusively of insects entitled from their habits to be called dung beetles, some of the *coprophagi* feeding chiefly on marine vegetables in a state of putrescence, and some of the *arenicoli* on the roots of plants. The DOR is one of the most common British beetles; it is of a stout form, less than an inch long; black, with brilliant metallic and blue reflections on the under surface; it may often be heard droning through the air towards the close of the summer twilight, and finds its way with rapidity and certainty to cow-dung, on which it feeds, and under which it burrows, making a large cylindrical hole, often of considerable depth, and depositing therein its eggs, enveloped in a mass of dung. These habits—more or less modified—are shared by many other species, which thus not only hasten the removal of what would otherwise become offensive on the surface of the ground, but even distribute it in the soil, where it affords nourishment to plants.—The sacred beetle or scarabæus (q.v.) of the Egyptians (*scarabæus sacer*, or *ateuchus sacer* of modern entomologists) is a true D. B., one of the *coprophagi*, in size and color much resembling the dor. It is found not only in Egypt, but in the s. of Europe and w. of Asia, and deposits its eggs in dung, which it rolls into little balls for the purpose. A nearly allied insect (*gymnopleurus pilularius*), a native of North America, is known as the TUMBLE-DUNG BEETLE, from its habit of rolling globular pellets of dung to the place where they are to be buried in the earth. Several individuals sometimes combine their strength in this curious operation, which is performed by the hind-feet pushing backwards.—The dor, and some other dung beetles, simulate death to deceive their enemies when they apprehend danger, not, like many insects, by contracting their bodies as much as possible, and drawing in their legs, but by stretching every part out to the utmost, and rigidly fixing themselves in that position. Crows and other birds are supposed to prefer them in a living state.

DUNGEON. See DONJON.

DUNGLISON, ROBLEY, LL.D., 1798–1869; b. England, educated in Germany, and called to the chair of medicine in the university of Virginia; afterwards professor in the university of Maryland, and in the Philadelphia medical college. He was a diligent student, and enjoyed a high reputation for benevolence. He was the author of a large number of excellent medical books, among which are a *Medical Dictionary* and *Therapeutics and Materia Medica*. The dictionary is a standard work of its class.

DUNKELD, a city and burgh of barony in the e. of Perthshire, 15 m. n.n.w. of Perth. It lies in a deep romantic hollow, on the great e. pass (of Birnam) to the Highlands, on the left bank of the Tay, across which it communicates with the s. by a handsome bridge, built in 1809 by the duke of Athole. It is environed by dark-wooded and craggy mountains. Pop. '71, 839. D. is a place of great antiquity, dating probably from the 7th or 8th century. About the year 1130, king David I. made it the seat of a bishopric, of which the Culdees of the ancient abbey were the chapter. The choir of the cathedral, chiefly in the first pointed style, was built between 1318 and 1337; the nave, in the second pointed style, was built between 1406 and 1464; and the tower and chapter-house, also in the second pointed style, were built between 1470 and 1477. The choir is now the parish church. The nave, which is in ruins, contains one or two ancient monuments. The monument of the wolf of Badenoch (Alexander Stuart, earl of Buchan, who died in 1384) lies in the vestibule. The duke of Athole's grounds, unsurpassed in Scotland for extent and beauty, lie on the w. and n. of D., and include the cathedral; Craig-vinean and Craig-y-Barns; 50 m. of walks, and 30 m. of drives; falls of the Bran (upper one, 80 ft.), near Ossian's hall at the Rumbling bridge; and 20 sq.m. of larch-wood, including the first two larches planted in Britain (in 1737). D., in ancient times, is said to have been the seat of the Pictish kings. It was the seat of a diocese from 1127 to 1688. Three m. s. of D. stood Birnam wood, so famous in connection with the fate of Macbeth.

DUNKERS, or TUNKERS. See BAPTISTS, GERMAN.

DUNKIRK, a village on lake Erie, in Chautauqua co., N. Y., reached by the Lake Shore and Michigan Southern railroad; 40 m. w. of Buffalo. It is at the w. end of the New York and Erie railroad; pop. of township, '75, 7,665. Dunkirk is a port of entry, with a good harbor, and has a large lake trade by steam and sailing vessels. In the town are an opera house, a dozen or more churches, an orphan asylum, a monastery, a public hall, the extensive repair-shops of the Erie railroad, locomotive works, iron works, and other factories. There is a horse railroad to the village of Fredonia.

DUNKIRK, or DUNKERQUE, the most northerly seaport and fortified t. of France, stands on the eastern shore of the strait of Dover, in the department of Nord, its distance from Paris being in a direct line about 155 m. n., and from Lille about 43 m. n.w. The town, which is connected by railway and canal with the principal manufacturing centers of Belgium and France, is surrounded by ramparts and ditches, and is defended

by a citadel. It is well built, the streets spacious and well paved, the houses chiefly of brick. Its quay and pier, its church of St. Eloi—a Gothic structure, having a handsome though rather incongruous frontispiece in its Corinthian portico—its town-hall, barracks, college, and theater, are the principal architectural features. The harbor of D. is shallow, and the entrance difficult, but the roadstead is large and safe. D. has manufactures of soap, starch, beer, beet-root sugar, cordage, and leather; also metal foundries, distilleries, salt refineries, and ship-building yards. Forming as it does the outlet for the great manufacturing department of Nord, its trade by sea is very considerable. Since becomnig a free port, it has also carried on a good trade in wine and liquors. Its cod and herring fisheries are actively prosecuted. The immediate vicinity of D. has a dreary and uninteresting appearance. Pop. '76, 35,012.

D. is a place of considerable historic interest. It owes its origin, it is said, to the church built by St. Eloi in the 7th c., in the midst of a waste of sand-hills or dunes, and hence its name, "Church of the Dunes." D. was burned by the English in 1388, taken by them under Oliver Cromwell in 1658, but sold to Louis XIV. by Charles II. for a sum of money in 1662. By the treaty of Utrecht in 1715, the French were compelled to destroy the fortifications of D., which were again restored, however, in 1783. In 1793, the allies under the duke of York laid siege to D., but were compelled by the French to retire, after having suffered severely. D. was made a free port in 1826.

DUNKLIN, a co. in s.e. Missouri, on the Arkansas border; 700 sq.m.; pop. '70, 5,982—166 colored. The surface is mostly prairie and swamp, with moderate fertility. Agriculture is the chief business. Co. seat, Kennet.

DUNLAP, WILLIAM, 1766–1839; b. N. J.; a painter and author. His early life was devoted to painting, interspersed with literary and theatrical work. He wrote a number of plays, and published a *History of the American Theater; Arts of Design in the United States;* and a *History of the New Netherlands.* He was one of the founders of the New York academy of design.

DUNLIN, or PURRE (*tringa alpina*, *T. cinclus*, or *T. variabilis*), a bird of the family *scolopacidæ* (snipes, etc.), and of the large group to which the names sandpiper and stint are variously given. It is not quite 9 in. in length from the extremity of the bill to that of the tail. The plumage undergoes great variations in summer and winter. It is a very widely diffused bird. In summer, it frequents even the desolate shores of Melville island. It is to be seen in autumn and winter on the shores of Britain and of most parts of Europe; often in very great numbers on sandy or muddy sea-shores; and is equally common on those of America from the gulf of St. Lawrence to the gulf of Mexico. It exhibits great restlessness and activity in running about, searching and probing for its food. "When flying in great autumnal flocks, its aërial movements are extremely beautiful, each individual of the vast assemblage yielding so instantaneously to the same impulsion as to exhibit alternately the upper and the under surface of the body, so that we have for a time a living moving cloud of dusky brown, and then a brilliant flash of snowy whiteness."

DUNMORE, a borough in Pennsylvania, Luzerne co., near Scranton; pop. '70, 4,311. Coal mining is the chief business.

DUNMOW FLITCH OF BACON, a prize instituted at Dunmow, in Essex, in 1244, by Robert de Fitzwalter, on the following conditions: "That whatever married couple will go to the priory, and kneeling on two sharp-pointed stones, will swear that they have not quarreled nor repented of their marriage within a year and a day after its celebration, shall receive a flitch of bacon." The prize was first claimed in 1445, two hundred years after it had been instituted. After 1751, up to which date only five presentations had taken place, the flitch was not again claimed till 1855. The tenth occasion of awarding the flitch occurred in 1876.

DUNN, a co. in n.w. Wisconsin on Chippewa and Red Cedar rivers; 864 sq.m.; pop. '70, 9,488. Productions, grain, hay, butter, etc. Co. seat, Menomonee.

DUNNAGE, on shipboard, is a name applied to miscellaneous fagots, boughs, bamboos, old mats or sails, and loose wood of any kind, laid in the bottom of the hold to rest the cargo upon; either to keep the ship in trim or to preserve the cargo from damage by leakage.

DUNNET HEAD, a rocky peninsula, 100 to 600 ft. high, the most northerly point of Scotland, on the n. coast of Caithness, in lat. 58° 40′ n., and long. 3° 21′ west. It consists of upper old red sandstone, resting on the middle flagstone of the same system. It is frequented by various species of sea-fowl, among which is the puffin.

DUNNING, JOHN, Lord ASHBURTON, 1731–83; an English lawyer. His fame began in 1762 with his *Defense of the United Company of Merchants of England trading to the East Indies, and their Servants, particularly those at Bengal, against the Complaints of the Dutch East India Company to his Majesty on the Subject.* In 1763, he further distinguished himself in the defense of John Wilkes, whose cause he conducted throughout. In 1766, he was chosen recorder of Bristol, and the next year was appointed solicitor-general. After 1771, he was in the opposition, making many powerful speeches in parliament. In

1782, he was appointed chancellor of the duchy of Lancaster, and about the same time was raised to the peerage.

DUNNOCK. See HEDGE-SPARROW.

DUNNOTTAR CASTLE, the ancient seat, now in ruins, of the Keiths, the earls marischal of Scotland, on the Kincardineshire coast, a mile and a half s. of Stonehaven. It occupies the top of a rock 3 acres in extent, and 160 ft. high, overhanging the sea, with a deep though dry chasm between it and the mainland, and it is approached by a steep winding path. In 1296, Wallace is said to have taken the rock and the kirk of Dunnottar from the English. During the commonwealth, the regalia of Scotland were hid in the castle from the republican army, and before the garrison surrendered to Cromwell's troops in 1651, the regalia were removed and secreted in the church of Kinneff, by Mrs. Grainger, the minister's wife. In the times of James II. and Charles II., D. C. was one of the state prisons, where the Covenanters were confined. It was dismantled after the rebellion of 1715, on the attainder of the last earl marischal.

DUNOIS, JEAN, called the bastard of Orleans, count of Dunois and Longueville, one of the most brilliant soldiers that France ever produced, was b. about the year 1403. He was the natural son of Louis duke of Orleans, brother of Charles VI., and was brought up in the house of that prince along with his legitimate children. D. is said to have been intended for the church, but this is doubted. His first important military achievement was the overthrow of the English at Montargis (1427). He next threw himself into Orleans with a small body of men, and bravely defended the place till the arrival of the famous Joan of Arc, whose religious enthusiasm combined with the valor of the bastard raised the drooping spirits of the French, and the English were obliged to raise the siege. This was the turning-point in the fortunes of the French nation. In 1429, D. and the maid of Orleans won the battle of Patay, after which he marched, with a small body of men, through the provinces then overrun by the English, and took the fortified towns. The capture and death of Joan of Arc arrested for a moment the progress of the French arms, but the heroism of D. was irresistible. He took Chartres, the key of Paris, forced Bedford to raise the siege of Lagny, chased the enemy from Paris, and within a very short period deprived them of all their French conquests except Normandy and Guienne. The next grand series of successes on the part of D. was the expulsion of the English from Normandy. Town after town yielded—Rouen, Harfleur, Honfleur, Caen, Falaise, Cherbourg. This splendid campaign lasted only a year and six days. Not less triumphant was his career immediately after in Guienne; Montguyon, Blaye, Frousac, Bordeaux, and lastly Bayonne, fell into his hands. The English, in fact, were swept out of the country, and the freedom of France from all external pressure permanently secured. Louis XI., on his accession to the throne in 1462, dispatched D. as governor to Genoa, which had yielded itself to France, but soon after, in a fit of jealousy and suspicion, deprived him of all his offices. D. now placed himself at the head of the alliance *Pour le Bien Public*, and by the treaty of Conflans, 1465, recovered all his confiscated estates. He died 24th of Nov., 1468. "There is no name so popular in France as that of D.; there is no hero so national; he labored 25 years for the deliverance of his country, and this *alone*—his sword was never unsheathed, except against the English. He never had a force under him which could enable him to win a victory that might balance Agincourt or Crécy, but the multitude and constancy of his petty successes served the cause of France more effectively than great and sanguinary contests would have done.

DUNOON, one of the most frequented sea-bathing places and summer residences in the w. of Scotland, is situated in the s.e. of Argyleshire, on the w. side of the firth of Clyde, 9 m. w. of Greenock. A village existed here from a very early date, but a new well-built town, with fine villas around, has of late years sprung up. The pop. of D. in 1871 was 3,756. Dunoon castle, of which only a small part now remains, stood on a conical hill near the pier, and was once a royal palace and strong fortress. The Argyle family once lived here, but the building became a ruin about 1700.

DUNSE, a burgh of barony in the Merse, in the middle of Berwickshire, the largest t. in the co., on an eminence on the Whitadder, 44 m. s.e. of Edinburgh, and 13 w. of Berwick-on-Tweed. Pop. '71, 2,618. To the n. of the town is Dunse Law, 630 ft. high.

DUNSINNANE, one of the Sidlaw hills, in the e. of Perthshire, 1114 ft. high, 7 m. n.e. of Perth, and looking towards Birnam hill (q.v.). On the top are the remains of the rampart and fosse of an ancient fortification, popularly called Macbeth's castle.

DUNS SCO'TUS, one of the most famous and influential of the scholastics of the 14th century. His history is involved in considerable obscurity. England, Scotland, and Ireland all contend for the honor of having given him birth, but without anything to offer in support of their respective claims beyond inference from his name. As to the date of his birth, all that can be said is, that it was in the last half of the 13th century. Whatever was the history of his youth, he entered early the order of Franciscans, studied at Oxford, and soon became professor of theology. His prelections were attended by crowds of auditors, the number of students at Oxford then exceeding 30,000. About 1304, he removed to Paris, then the chief seat of scholastic philosophy, where he taught

theology with great applause. He was especially distinguished for the zeal and ability with which he defended the immaculate conception of the Virgin against Thomas Aquinas. He is said to have demolished 200 objections to the doctrine, and established it by a cloud of proofs. It continued long a point of dispute between the Scotists and Thomists; and it was only in 1854 that the dogma was by papal authority declared a necessary doctrine of the Catholic faith, which it is now heresy to deny. In 1308, D. S. was called to Cologne to oppose the heresies of the Beguin brethren, and there he suddenly died, in the 34th or 43d year of his life. D. S. was mostly opposed to Thomas Aquinas in theological opinions, and held very tenaciously the doctrine of the absolute freedom of the human will, from whose spontaneous exercise he derives all morality. He was a realist in philosophy, and his followers are on that ground opposed to the Occamists, who were nominalists. See the article NOMINALISM. He defended his opinions in the style of dialectic then in vogue, and with an acuteness that got him from his contemporaries the name of Doctor Subtilis. When, however, at the revival of learning, the followers of Duns, or *Dunsmen*, saw that the hair-splitting style of reasoning was going out of fashion, they "raged," as old Tyndal says, "in every pulpit" against the new classic studies, so that the name gradually came to signify not only one opposed to learning, but one slow at learning; hence our word *dunce*, a blockhead. It would be difficult to indicate the nature of his speculative opinions without entering into particulars, nor are his writings as yet sufficiently known and explored for the formation of a decided judgment. The most famous of his works, besides his commentaries on the Bible and on Aristotle, is his Commentary on the Sentences of Peter Lombard, called the *Opus Oxoniense*, of which the *Opus Parisiense* is an abridgment. The chief edition of his works is that of Luke Wadding (12 vols., Lyons, 1639), but it is by no means complete. The controversies carried on so long between the Scotists and Thomists owed their bitterness not so much to zeal for science and religion, as to the jealousy existing between the Franciscans and Dominicans.

DUNSTABLE, a t. in the s. of Bedfordshire, at the e. base of the Chiltern chalk-hills or Dunstable downs, 18 m. s.s.w. of Bedford. It chiefly consists of one main street crossed by another. The houses are mostly of brick, some of them very old. Pop. '71, 4,558. D. is the chief seat of the British straw-plait manufacture, which employs many women. Whiting is also made. In winter, many large larks are caught in the neighborhood, and sold chiefly in London as an article of luxury. Henry I. founded here a priory of black canons, of which the present parish church is a part. D. was in 1110 the scene of some of the earliest theatricals, the subject being the miracles of Catherine, by abbot Geoffry of St. Albans.

DUNSTAN, SAINT, was b. at or near Glastonbury, in Somersetshire, 925 A.D. He was of noble birth, and is said to have been remotely related to the royal family, as well as connected with the church through influential relatives. His early studies, which he pursued with extraordinary assiduity, were superintended by Irish teachers; but besides his professional learning, D. possessed a variety of accomplishments. He was an excellent composer in music; he played skillfully upon various instruments; he was a painter, a worker in design, and a caligrapher; a jeweler, and a blacksmith. While quite a youth he was presented at the court of king Athelstan, who seems to have been delighted with his music; but the courtiers envying the favor of the sovereign, denounced him as a dealer in sorcery, and procured his expulsion from court. D. now began to figure in a new character. Contiguous to the church of Glastonbury, he erected a cell, 5 ft. in length by 2 in breadth, the floor of which was sunk beneath the surface, while the roof, on the outside, was only breast-high, so that he could stand upright in it, though unable to lie at full length. This was at once his bed-chamber, his oratory, and his workshop. It was here that (according to the monkish legends) he had his most celebrated contest with the devil. One evening, while the saint was employed at his forge, the devil thrust his head in at the window, and began to tempt him with some immoral propositions. D. patiently endured the annoyance until his tongs were red hot in the fire, when, snatching them suddenly up, he seized the foul fiend by the nose, and held him till the whole neighborhood resounded with the clamor of his agony. Gradually, D. acquired a great reputation for sanctity; and on the accession of Edmund to the throne in 940, he was recalled to court; but in spite of the exploits and penances which had made his banishment illustrious, he was still opposed by the courtiers, who saw his ambition, and dreaded his talents. A second time D. was dismissed, but the king made him abbot of Glastonbury, and increased the privileges of that monastery. Edred, nicknamed *debilis pedibus* (weak in the feet), who succeeded Edmund in 946, showed D. great favor. The saint now began to distinguish himself as a statesman, and the vigorous policy of Edred's reign is affirmed to have proceeded from the inspiration of Dunstan. If such was the case, then to D. was owing the complete subjugation of the Northumbrian Danes. Edred was succeeded by Edwy in 955, who detested D., and not without reason, for the saint, on the day of Edwy's coronation, had grossly insulted his wife and her mother. Besides, Edwy had long suspected D. of peculation in his charge, and this outrage made his wrath overflow. D. was deprived of his clerical office, his places at court were taken from him, his so-called reform—viz., of compelling the clergy to become celibates—was frustrated, the monks were driven out of

their monasteries, their functions handed over to the secular clergy, and D. himself was banished. He fled to Flanders, narrowly escaping having his eyes put out by the messengers whom the infuriated king had sent after him. After D.'s flight, a rising took place among the Northumbrian Danes, instigated by Odo, archbishop of Canterbury, himself a Dane, and a friend of the expatriated saint. Edgar, the brother of Edwy, was chosen king of the whole of the island n. of the Thames, and D. returned in triumph from his brief exile. Meanwhile, Edwy's beautiful wife, Elgiva, had been seized and murdered, under circumstances of horrid cruelty, by the Mercians, who were armed in the cause of D. and Odo, or, as others say, by the immediate retainers of these churchmen themselves. Edwy himself died of a broken heart, or (according to an old MS. in the Cottonian library) was assassinated, in 958, and was succeeded by his brother Edgar. The latter, as a boy of 15, could exercise little authority: he was long a passive instrument in the hands of D. and his party, who used their power in establishing their cause over the whole island, in enforcing the celibacy of the clergy, and in driving out by main force from all abbeys, cathedrals, and churches, all such married clergymen as would not separate from their wives. At the same time, it cannot be denied that D. and the monks ruled the kingdom with vigor and success, and consolidated the detached states into compacter integrity and union than had ever been known before. The Danish districts of Anglia and Northumbria were divided into earldoms or governments; the fleet of the king was increased to 360 sail, which acted as a most efficient coast-guard, preventing the Norse rovers from making their usual destructive descents on the country. In 960, D. was made archbishop of Canterbury on the death of his friend Odo, when, according to custom, he went to Rome to receive the pall at the hands of the pope. He also induced Edgar to visit in person every part of his dominions annually, when courts of justice were held in the various districts, audiences and feasts given, and appeals heard. The many other beneficial measures of Edgar's reign, such as the reform of the coinage, and the endeavor to extirpate wild animals in the mountainous districts, are generally, and with good reason, attributed to Dunstan. The king, who was zealous for the celibacy of the clergy, was himself one of the most viciously profligate of the Saxon kings; yet D. could wink at his crimes, so long as he himself was allowed to carry out his "religious" schemes. On the death of Edgar, a fierce struggle took place between the partisans of Edward the martyr and his half-brother Ethelred. The cause of the former was espoused by D., who succeeded in placing his favorite on the throne; but the mother of Ethelred, named Elfrida, a beautiful but ferocious woman, caused Edward to be murdered in 979, and D. was compelled to place the crown on the head of Ethelred. The credit and influence of the great monk now declined; his threatenings of divine vengeance were treated with contempt; and soured and exasperated at the triumph of his enemies, he retired to his archiepiscopal city, where he died of grief and vexation, May 19, 988. D. was a man of extraordinary abilities. His vigor, his persistency of purpose, and his stern and unscrupulous disposition, would have elevated him to power in any age; but he possessed, in addition to these qualities, a deep knowledge of the weaknesses of human nature, and a clear and penetrating understanding, which enabled him to see what it was necessary and prudent for a ruler to do. Hence, though despotic to the last degree, he was not blindly so, like a commonplace despot. His ambition was ever under the control of his wisdom and his fixed ideas. But the grand designs of his life—viz., the complete subjection and conformity of the Anglo-Saxon church to that of Rome, and the extension and multiplication of ecclesiastical interests—are not such as excite the admiration of modern times, and all discerning people will regret the success that attended the unpatriotic labors of the saint. That he *was* successful, there can be no manner of doubt. Though personally out of favor at court in the latter years of his life, his efforts to spread his official influence were unceasing. At an early period in his career, he had introduced a new order of monks into the land, the Benedictines, whose strict discipline had changed the character and condition of ecclesiastical affairs, and in spite of the confusion and even opposition thus caused, he persevered to the end. Monasteries continued to be founded or endowed in every part of the kingdom; and such were the multitudes who devoted themselves to the cloister, that the foreboding of the wise Bede was at length accomplished—above a third of the property of the land was in possession of the church, and exempted from taxes and military service. D.'s *Concord of Monastic Rules* will be found in Reyner's *Apostolatus Benedictinorum in Anglia*, fol., Duac. 1626, page 77 of the appendix. Other writings have been attributed to him. See Wright, *Biog. Brit. Lit., Ang.-Sax. Period.* See also William of Malmesbury, Lingard's *History of England*, Kemble's *Saxons in England*, book ii., and *Memorials of St. Dunstan*, edited by W. Stubbs, M.A. (1875), a collection of six biographies of the saint.

DUNSTER, HENRY, d. 1659; b. England; educated at Magdalen college, Cambridge; came to Massachusetts, 1640, and in the same year became the first president of Harvard college. He was esteemed for piety and learning; but was compelled to resign his office, 1654, for having publicly opposed infant baptism.

DUNTON, JOHN, 1659–1733; b. in England, and apprenticed to a bookseller. In 1686, he migrated to New England to sell books. He conducted *The Athenian Mercury*, of which 20 vols. appeared. He was a prolific writer on religion, morals, and politics.

DUODEC'IMAL SCALE (Lat. *duodecim*, twelve) is the name given to the division of unity into twelve equal parts, as when the foot is divided into 12 in., and the inch into 12 lines; or the pound is divided into 12 ounces. This plan of counting has some advantages, as 12 admits of so many divisions into equal parts—viz., by 2, 3, 4, and 6. But the decimal scale, or division into ten equal parts, is now universally recognized as preferable, from its coinciding with our decimal system of notation.—DUODECIMALS is a term applied to a method of calculating the area of a rectangular surface when the length and breadth are stated in feet and inches.

DUODEC'IMO (Lat. *duodecim*, twelve) is that form of volume whose leaf is equal to the twelfth part of a folio—the folio being the large sheet called the *broadside*, folded once. A book is said to be *quarto*, *octavo*, *duodecimo*, etc., because the sheet of which the pages of the book are made up, has been folded into four, eight, twelve leaves, etc. Quarto, octavo, and duodecimo, are almost always written 4to, 8vo, and 12mo.

DUODE NUM. See DIGESTION.

DU PAGE, a co. in n.e. Illinois, traversed by four or five railroads; 340 sq.m.; pop. '70, 16,685. The soil is very fertile, producing grain and fruit in abundance. Co. seat, Wheaton.

DUPANLOUP, FÉLIX ANTOINE PHILIBERT, b. Savoy, 1802; d. Paris, 1878. In 1825, he was ordained a priest; in 1827, was confessor to the young duke of Bordeaux; next year catechist to the Orleans princes; and in 1830, chaplain to the daughter of Louis XVI. In 1849, he became bishop of Orleans, where he first gave full scope to his plan for Christian education. In 1848, he was instrumental in having the first French expeditionary corps sent to the papal states. He was often in conflict with the censor of public worship in France. He opposed papal infallibility, but was prompt to accept the dogma when it had been promulgated. At the close of the war with Germany he was sent as a representative to the national assembly, where he favored a constitutional monarchy, the restoration of the Bourbons, and a complete system of education. He published a number of works on religious subjects.

DUPERREY, LOUIS ISIDORE, 1786–1865; a French navigator and scientist, native of Paris. He served under Freycinet in the voyage around the world (1817–20), in charge of the hydrographic operations. In 1822–25, he was in command of a vessel, making scientific explorations in the Pacific and along the coasts of South America. The later portion of his life was devoted to investigations in terrestrial magnetism. He was a member of the French academy of sciences.

DUPERRON, JACQUES DAVY, 1556–1618; a French cardinal. He was brought up a Protestant, but at the age of 20 abjured, and was appointed reader to king Henry III. He became noted as a pulpit orator, and rose to fame and fortune. Soon after Henry IV. came to the throne, Duperron converted him to the Roman Catholic faith, and after the taking of Paris, went to Rome to induce the pope to remove the interdict laid upon the kingdom. In 1604, he was sent to Rome as chargé d'affaires, and within a month was active in the election of two popes—Leo XI. (who reigned 24 days), and Paul V. While at Rome he was made archbishop of Sens, and soon afterwards a cardinal. Duperron was a zealous advocate of papal prerogative, and a man of great ability and untiring energy.

DU PETIT-THOUARS, ABEL AUBERT, 1793–1864; a French naval officer. From 1837 to 1839, he was circumnavigating the globe; rose afterward to be rear-admiral and commanded the Pacific fleet. In 1842, he placed the island of Tahiti under the protection of France, and the same year extended the protectorate over the Marquesas islands. In 1843, when the English missionaries and the natives of Tahiti rose against French rule, he placed the whole Society group under French domination. At the demand of the English government he was recalled. In 1846, he was made vice-admiral, and in 1849, was elected to the legislative assembly. He wrote *A Voyage Around the World.*

DUPLEIX, JOSEPH FRANÇOIS, 1697–1764; Governor-General of the French establishments in India. He made several voyages to America and India, and displayed remarkable business aptitude. While governor in India his ambition was to extend French possessions, and he was frequently in diplomatic contest and in armed conflict with the English, at the same time endeavoring to win over the native princes. All this was theoretically stopped by the peace of Aix-la-Chapelle; still Dupleix continued his efforts, entering into negotiations for the subjugation of Southern India, and sending troops to the aid of two claimants of the sovereignty of the Carnatic and Deccan, while the English were engaged on the side of their rivals. His scheme failed, but the trouble continued until 1754, when Dupleix was recalled to France. He died in obscurity and want.

DUPLIN, a co. in s.e. North Carolina, watered by a branch of Cape Fear river, and intersected by the Wilmington and Weldon railroad; 670 sq.m.; pop. '70, 15,542—6,766 colored. The surface is level, and the soil sandy, with some fertile tracts. Productions—corn, rice, cotton, etc. Co. seat, Kenansville.

DUPIN, ANDRÉ-MARIE-JEAN-JACQUES, a French statesman and lawyer, was b. 1st Feb., 1783, at Varzy, in the department of Nièvre, and studied in Paris. In 1815, he was elected a member of the chamber of representatives, when he opposed the motion for proclaiming Napoleon II. successor to the throne. During the same year, he published his treatise, *Sur la Libre Défense des Accusés*. The attention excited by this work procured him the honor of defending marshal Ney, and afterwards the English officers, Wilson, Bruce, and Hutchinson, accused of having favored Lavalette's escape. He had also the honor to defend the poet Béranger in 1821. From 1825 to 1829, he was the advocate of the liberal party. In his pamphlet, *La Révolution de* 1830, he endeavored to prove the legal character of this revolution; and on the question being mooted whether the new king should assume the title of Philippe VII., D. declared "that the duke of Orleans was called to the throne not *because* he was a Bourbon, but *although* he was a Bourbon, and on the condition that he should not follow in the footsteps of his predecessors." After having been appointed to various important offices by the new government, D. found it necessary to pass over to the opposition, and was eight times chosen president of the chamber of deputies. On the revolution of 1848, he urged (but unsuccessfully) the chamber to proclaim the comte de Paris king of the French, with the duchess of Orleans regent during his minority. In consequence of the confiscation of the Orleans estates in 1852, D. resigned his place, and retired for a time from public life; but in 1857, he consented to resume his previous office of *procureur-général* of the court of Cassation. He is the author of many important works, mostly on legal questions, among which may be mentioned his *Manuel du Droit Ecclésiastique Français*, which had the high honor of being censured by the congregation of the *Index* at Rome. In 1853 appeared his *Le Morvan; Topographie, Agriculture, Mœurs des Habitants, Etat Ancien, Etat Actuel;* and in 1857, *Règles Générales de Droit et de Morale tirées de l'Ecriture Sainte*. D. died in 1865.

DUPIN, FRANÇOIS-PIERRE-CHARLES, Baron, a French economist, brother to the preceding, was born at Varzy, in the department of Nièvre, 6th Oct., 1784, and educated at the polytechnic school, Paris. During the empire, he was actively employed as an engineer. Between 1816 and 1819, he made several visits to England and Ireland, to study the great works of construction in those countries. The results of his investigations appeared in his *Voyages dans la Grande Bretagne* (6 vols., Paris, 1820–24, with atlas)—a comprehensive statement of the advantages and defects of British internal administration, exhibiting in a popular form a complete view of the roads, canals, aqueducts, bridges, ports, etc., of this country. D. was about this time appointed member of the académie des sciences, and in 1824 was raised to the rank of baron. In 1828, he was elected deputy for the department of Tarn, and he took part with the liberal opposition. After the Feb. revolution of 1848, D. was elected member of the constituent assembly by the department of Seine-Inférieure. After the *coup d'état*, he became a senator of the empire. D. published a multitude of works on geometry, naval affairs, commerce, etc. He died in 1873.

DUPLICATE RATIO. See PROPORTION.

DUPLICATION OF THE CUBE. See DOUBLING THE CUBE.

DUPONCEAU, PETER STEPHEN, LL.D., b. France, 1760, d. Philadelphia, 1844. He was bred to the law, and became secretary to baron Steuben, and with that soldier came to aid the Americans in the revolution. He was with Steuben through the war, and at its close took up his residence in Philadelphia, where, in 1785, he was admitted to the bar. He was offered, but declined, the chief-justiceship of Louisiana. He paid much attention to philology; and in 1819, as chairman of the committee on history, moral science, and general literature of the American philosophical society, he made a report on the structure of the Indian languages. In 1835, the French institute sent him the Volney prize for a similar work. In 1838, he published an essay on the Chinese system of writing. He also wrote on the cultivation of silk, and made efforts to establish its culture in the United States. He wrote on many other subjects, and his contributions to American history were valuable.

DUPONT, JACQUES CHARLES, styled DE L'EURE, a leader of the French liberal party, b. 27th Feb., 1767, at Neubourg, in Normandy. During the periods of the revolution and the empire, he filled several important offices. In 1813, he became a member of the legislative body, and acted as vice-president when this assembly was convoked by Louis XVIII. on the fall of Napoleon. During the hundred days he was elected to represent the department of Eure, and, after the battle of Waterloo, became vice-president of the chamber of representatives. After the revolution of 1830, he was appointed minister of justice, but at the end of six months sent in his resignation, and took his place in the ranks of the opposition. After the revolution of 1848, during the session of the 24th Feb., D. took the president's chair, and so far silenced the tumult of the populace, as to render it possible to appoint a provisional government, of which he was proclaimed president. He died in 1855. His political friends styled him the most virtuous among the virtuous, the Aristides of French liberalism. His disinterestedness was not denied even by his enemies; but he manifested fidelity to his convictions rather than energy of character.

DUPONT, PIERRE, 1821–71; b. at Lyons, the son of a workman of Provins. He was brought up by his cousin, who was priest of Roche-Taillée-sur-Saône, and, after leaving the seminary of Largentières, passed a short time in a lawyer's office. In 1839, he found his way to Paris, where he succeeded in having some of his poems published in the *Gazette de France* and the *Quotidienne*. His first volume of poems, *Les Deux Anges*, appeared in 1841; and in 1847, he made a great hit by his peasant song, *J'ai deux grands bœufs dans mon étable*, which induced him to devote himself to lyrical poetry. Many of his songs, accompanied by airs of his own invention, became very popular. Among the best known are *Le braconnier; Le tisserand*; *La Vache blanche;* and *La chanson du blé.*

DU PONT, SAMUEL FRANCIS, 1803–65; b. N. J.; midshipman in the navy, 1815; lieut., 1826; commander, 1843. In 1845, he commanded commodore Stockton's flagship in the Pacific squadron, and, during the war with Mexico, did service on the California coast, taking a leading part in the capture of Mazatlan. In 1856, he was made capt., and was sent on special duty to China. When the rebellion began, he was in command of the Philadelphia navy-yard. In Sept., 1861, he was appointed flag officer, and given command of the South Atlantic blockading squadron. In Nov., he captured the forts at Hilton Head and Bay Point, the defenses of Port Royal harbor. In 1862, he was made rear-admiral. In April, 1863, he made an unsuccessful attack on Fort Sumter. In the following year, he was retired from active command.

DUPONT DE L'ÉTANG, PIERRE, Count, 1765–1838; a French officer, appointed brigadier in 1793, and gen. of division in 1797. He was with Napoleon at the overthrow of the directory; fought at Marengo; defeated a superior Austrian force at Pozzolo; won further laurels in the Austrian and Prussian campaigns, and, by a singularly bold movement, decided the victory of Friedland. In 1808, he commanded in Spain, where he was compelled to surrender his whole army. For this, he was degraded and imprisoned. On the fall of the emperor, he was restored to liberty and made minister of war, but was soon dismissed. After the second restoration, he became a member of the privy council. He was several times elected to the chamber of deputies.

DUPONT DE NEMOURS, PIERRE SAMUEL, 1739–1817; a French statesman and economist, a prolific writer on questions of finance. In 1772, he was secretary of the council of public instruction of Poland. He came back two years afterwards to assist his friend Turgot in the French administration. With Turgot he went into retirement, where he wrote the memoirs of his friend, and translated Ariosto. In 1782, he was employed in constructing the treaty by which the independence of the United States was recognized. Subsequently he was a member of the council of state, and was appointed commissary-gen. of commerce. During the revolution he favored a constitutional monarchy, but was compelled to flee when the republicans triumphed. During his concealment he wrote his *Philosophy of the Universe*. He was found and imprisoned; but as Robespierre's head fell first, Dupont's was saved. He was one of the council of five hundred, and a thorough reactionist. In 1797, his house was sacked by a mob, and he narrowly escaped transportation. Finding France uncomfortable, in 1799 he and his family emigrated to the United States. In 1802, he returned, but declined to receive any political office, except that he was one of the commissioners to arrange the transfer of Louisiana to the United States. Jefferson, whose love of French democratic institutions was only equaled by his hatred of anything English, requested Dupont to prepare a scheme of national education, which was published in French in 1812. The scheme was never adopted in the United States, but some of its features were embodied in the French code. After Napoleon's first downfall, Dupont became secretary to the provisional government, and on the restoration of the Bourbons, he was made a councilor of state. The return of Napoleon caused him to leave France, and he spent the remainder of his life with his two sons, powder manufacturers, in the state of Delaware.

DÜPPEL, or DYBBÖL, a small fortified t. of the Prussian province of Sleswick-Holstein, in the peninsula of Sundewitt, 16 m. n.e. from Flensburg. During the war between Germany and Denmark, it was bombarded for more than a month by the Prussians, and finally taken, April 18, 1864.

DUPUIS, CHARLES FRANÇOIS, a distinguished French *savant*, was the son of a poor schoolmaster, and was b. at Trie-Chateau, near Chaumont, 16th Oct., 1742. He obtained admission into the college of Harcourt, where he so soon acquired such extensive knowledge that at the age of 24 he was made professor of rhetoric in the college of Lisieux. At the same time he went through a course of law studies, and was admitted an advocate of the parliament. His acquaintance with Lalande introduced him to the study of mathematics and astronomy, and he was led to the thought of explaining mythology by means of astronomy. After several communications in the *Journal des Savans*, appeared his *Mémoire sur l'Origine des Constellations et sur l'Explication de la Fable par l'Astronomie* (Par. 1781). He was now appointed professor of eloquence in the collége de France, member of the académie des inscriptions, and shortly after a member of the commission of public instruction. Although he rather shunned the storms of the revolution, his reputation necessitated his becoming a member of the convention, next of the council of 500, and after the 18th Brumaire, of the legislative body. He was also one of the 48 individuals who formed the nucleus of the institut national. His great work, *Origine de tou-*

les Cultes, ou Religion Universelle (12 vols., Par. 1794), which he had long withheld from fear of offending the religious world, was at last published at the instigation of the Cordeliers' club. This circumstance rendered the book more an object of party bitterness than its own purely scientific character would probably have called forth. It made a considerable impression on France at the time, and no doubt originated the famous commission afterwards appointed by Napoleon to explore Upper Egypt, which D. had pointed out as the general source of southern mythology. No less attention was awakened by his memoirs on the origin and spread of the Pelasgi, and on the zodiac of Denderah (q.v.). In his last work, *Mémoire Explicatif du Zodiac Chronologique et Mythologique* (Par. 1806), he attempts to demonstrate the unity of the astronomical and religious myths of all nations. He died 29th Sept., 1809.

DUPUYTREN, GUILLAUME, le Baron, an illustrious French surgeon and anatomist, was b. at Pierre-Buffière, in Limousin, 6th Oct., 1777; educated at the collége de la Marche in Paris; and on the formation of a new school of medicine there in 1794, was appointed to the office of *prosecteur*. In 1801, he was appointed *chef des travaux anatomiques*, and applied himself with intense ardor to pathological anatomy. In 1803, he was appointed assistant-surgeon, and later, in 1815, first surgeon in the Hôtel-Dieu. In 1813, he became professor of surgery to the medical faculty, an office which he exchanged, in 1818, for the professorship of clinical surgery at the Hôtel-Dieu. In 1820, Louis XVIII. conferred on him the title of baron, and in 1823, appointed him royal surgeon. He died at Paris, 8th Feb., 1835. D. possessed extraordinary penetration in diagnosis, a penetration that was generally justified by his bold and skillful operations, and an immovable firmness of nerve. He was the inventor of many ingenious modes of surgical operation and of various surgical instruments. He likewise made several important discoveries in pathological anatomy; and although he wrote very little, almost nothing indeed, he formed a large school of enlightened surgeons in his native country. Among his works may be mentioned *Leçons Orales de Clinique Chirurgicale faites à l'Hôtel-Dieu* (4 vols., Par. 1830–34), published by some of his students; and his *Traité Théorique et Pratique des Blessures par Armes de Guerre*, edited by Paillard and Marx (2 vols., Par. 1834).

DUQUESNE, ABRAHAM, Marquis, one of the most eminent naval officers of France, was b. at Dieppe in 1610, and trained under his father, the captain of a ship, for the naval service. In the war between France and Spain, he brilliantly distinguished himself at Corunna, Tarragona, Barcelona, and other places. During the minority of Louis XIV., when the navy of France was inactive, he entered the service of Sweden, which was then at war with Denmark. D. defeated the Danish fleet near Gothenburg in 1643, was elevated to the rank of vice-admiral, and by a succession of victories over the united fleets of Denmark and Holland, forced Denmark to conclude peace. He then returned to France, where he found the Spaniards prepared to support Bordeaux, which had declared itself for the party of the *Fronde* in 1650. D. immediately collected a squadron at his own expense, and compelled Bordeaux to submit. He was next employed in punishing the pirates of Algiers and Morocco who infested the Mediterranean. On the revolt of Messina against the Spanish government, France sent him to support the insurgents in the Mediterranean. With a small force, D. gallantly opposed the united fleets of Spain and Holland, commanded by De Ruyter, and in April, 1676, completely defeated his enemies off the coast of Sicily, in the vicinity of Mt. Etna. De Ruyter died a few days after. France thus obtained possession of the island of Sicily. Louis XIV. rewarded D. with the title of marquis and a considerable estate. On the revocation of the edict of Nantes, D. was made the only exception to the general decree of banishment issued against all Protestants. His last achievement was the humiliation of Genoa. D. died at Paris, 2d Feb., 1688. See *Duquesne et la Marine de son Temps*, by Henri Plon (Paris, 1872).

DUQUOIN, a city in Perry co., Ill., at the junction of the Illinois Central and the St. Louis and Southern Illinois railroads; 77 m. n. of Cairo; pop. '70, 2,212. It is in a rich coal region, and has a large trade in shipping tobacco, wool, etc.

DU'RA DEN, between Cupar and St. Andrews, in Fifeshire, a small glen through which runs a tributary of the Eden, has become famous on account of the numerous and beautifully preserved fossil fish entombed in its yellow sandstone. This sandstone is one of the upper beds of the old red sandstone. It is developed in D. D. to a thickness of 300 or 400 ft., and is rich in the remains of ganoid fishes. They occur in clusters and detached groups, sometimes crowded together in an extraordinary manner, so that nearly a hundred specimens have been counted on a single slab about five feet square. They are found only in one thin layer, no fragment of skeleton or scale having been obtained in any other portion of the sandstone. The specimens are beautifully preserved; they often exhibit the rounded plump form of the living animal, in some instances not a scale being displaced; the scales retain their original glistening enamel, very different from the white chalky appearance they present in other localities. The specimens consist of two species of *holoptychius*, viz., *Andersoni* and *Flemingii;* also of *dipterus, platygnathus, phaneropleuron Andersoni, glyptolæmus, glyptopomus,* and *pamphractus.* See *Dura Den,* by J. Anderson, D.D.

DURA MATER, the hard external membrane that envelops the brain. See NERVOUS SYSTEM.

DURA'MEN, or HEART-WOOD, in botany, the inner and fully ripened wood of exogenous trees. The division is often very marked between the *D.* and the *alburnum* (q.v.) or sap-wood, the D. being more dense and compact, and its tubes thickened and filled with peculiar secretions of the plant, so that juices no longer freely flow through them. It is also very frequently of a darker color than the alburnum: in ebony, it is black; and some other trees are remarkable for the peculiar color of their wood, which appears, however, only in the D., and not in the alburnum. As timber, it is much more valuable and durable than the alburnum; and the distinction is as well known to the carpenter or cabinet-maker as to the botanist.

DURAN, AUGUSTIN, 1789–1862; a Spanish poet, educated to the law in the university of Seville, and admitted as an advocate. In 1834, he was secretary of the board for the censorship of the press, and soon afterwards had a place in the national library, of which he became a director. He published a discourse on the influence which modern criticism had exercised on the ancient Spanish theater, a number of volumes of old romances, and a collection of old Spanish comedies. He is best known by his poem *The Three Citron Trees of the Orchard of Love.*

DURANCE, a river in the s.e. of France, rises in the department of the Hautes-Alpes, near the base of Mont Gènèvre, one of the peaks of the Cottian Alps. It flows through the department of the Basses-Alpes in a southerly direction; then curving westward, it proceeds towards the Rhone, forming the boundary between the departments of Vaucluse and Bouches-du-Rhone, and joins that river about 3 m. below Avignon. Its principal affluents are the Buech and the Calavon from the right; and the Ubaye, the Bleone, the Asse, and the Verdon from the left. Its total length is about 180 m.—no part of its course is navigable. Its current is swift and impetuous, and carries down with it great quantities of sand and pebbles. Large quantities of timber are floated down from the forest districts upon its banks to Arles, and thence to the Mediterranean. An aqueduct 51 m. long has been recently constructed from the D. to Marseilles. This great work not only supplies Marseilles with water, but affords water-power for driving machinery, and irrigates an otherwise parched area of 25,000 acres.

DURAND, ASHER BROWN, 1796–1874; b. N. J. He was at first a watchmaker, but in 1812 was apprenticed to an engraver in New York, becoming a partner in the business at the expiration of his time of service. His large engraving of Trumbull's *Declaration of Independence*, which cost him three years of work, brought him into notice, and thenceforward his path was one of success. In 1855, he quitted engraving and turned his entire attention to painting, at first portraits only, but later of natural scenery, in which he was ranked among the first of artists. He was for several years president of the New York national academy of design. He translated several works on art.

DURAN'GO, a state in n. Mexico, s. of Chihuahua, and w. of Coahuila; 42,498 sq.m.; pop. 190,846. The w. part is mountainous, but the e. is level and fertile. In the n.w. is a large and desolate area inhabited only by Indians. The climate is cold on the mountains, but generally temperate on the plains. Sugar cane, tropical plants and fruits, cotton, flax, wheat, and other cereals are grown. There are many rich gold mines; some deposits of silver; and copper and lead are abundant. The chief town is the city of the same name.

DURANGO, or GUADIANA, and also sometimes called CIUDAD DE VICTORIA, in honor of the first president of the Mexican confederation, is a city in Mexico, and stands in the Sierra Madre, at the elevation of 6,848 ft.—almost a mile and a quarter—above the level of the sea. Lat. 24° 2′ n., long. 104° 3′ west. It is near the Culiacan (q.v.), being 150 m. to the n.w. of Zacatecas. It is regularly built, with a cathedral and other churches, and with convents, a theater, and a mint, and the inhabitants, 14,000 in number, carry on manufactures in iron, wood, wool, and leather. The city gives name to a department containing 42,500 sq.m., and in 1873, occupied by 190,846 inhabitants.

DURANGO, sometimes called CIUDAD DE VICTORIA, or GUADIANA, a city of Mexico, capital of the state of Durango, near the foot of the s. slope of the Sierra Madre, 7,295 ft. above the sea-level; pop. 12,449. The city was founded in 1559 by Alozo Pacheco as a military post for the control of the natives. It is the center of a Roman Catholic bishopric, and has a cathedral, churches, a hospital, a penitentiary and other government buildings, a bull-ring, and a cock-pit. The city is well supplied with water by warm and cold springs. There is trade with the adjoining states, a mint, a gold refinery, glass works; and cotton, woolen, leather, and tobacco manufactories.

DURAN'TE, FRANCESCO, 1684–1755; an Italian composer, and one of the founders of the Neapolitan school of music. He was chapel-master in Naples, and in 1742 was at the head of the Conservatorio Santa Maria di Loretto in that city. He had unexampled fame as a teacher, and the most celebrated masters of the earlier school of Italian opera were among his pupils. Under Durante the Neapolitan school reached the climax of its celebrity, and it was in this school that the great traditions of Italian vocal art were established. As a composer he adhered to the severe style of the early Italian masters.

DURAZZO (called by the Turks *Dratsch*, and by the Slaves *Durtz*), a maritime t. of Albania, European Turkey, is built on the rocky peninsula of Peli, in the Adriatic. Lat. 41° 19′ n., long. 19° 27′ east. It is fortified, and is a place of considerable antiquity.

Its situation in a fertile district gives it an export trade in grain, oil, etc.; but in recent years, owing to partial failures in crops, and disease in olives, the exports have been small. D. has large imports of British manufactured goods; and also of sugar, coffee, rice, soap, and iron. It contained in 1871 only 1200 inhabitants.

D. is the ancient *Epidamnus*, which was founded about 627 B.C. by a conjoined band of Corcyræans and Corinthians under one Phaleus, a Heracleidan. It became a great and populous city, but was much harassed by the internal strifes of party, which ultimately led to the Peloponnesian war (q.v.). Under the Romans it was called Dyrrachium (whence its modern name), and became the seat of a Roman colony, and an important landing-place for those sailing from Brundusium in Italy to Greece. Here Pompey was for some time beleaguered by Cæsar. Dyrrachium attained its highest consequence about the 4th c., when it became the capital of the Byzantine eparchy of New Epirus. After being possessed successively by the Ostro-Goths, the Bulgarians, the Normans, and the Venetians, and been destroyed by an earthquake, it was finally conquered by the Turks in 1502, in whose possession it still remains.

D'URBAN. See NATAL.

DURBHANGAH, the capital of a district of the same name in Bengal, India, in the province of Behar, Patna division. Pop. in 1872, 47,450.

DURBIN, JOHN PRICE, D.D., 1800–76; b. Ky. At an early age he entered the Methodist itinerant ministry, studied while preaching, graduated at Cincinnati college, and was made professor of languages in Augusta college, Ky. In 1831, he was chaplain to the U. S. senate; in 1832, editor of the *Christian Advocate and Journal;* in 1834, president of Dickinson college; subsequently traveled in Europe, and in 1844 was prominent in the great slavery discussion which divided the church. He left the college in 1845, and was pastor in Philadelphia and presiding elder of the district. From 1850 to 1872, he was secretary of the missionary society, and to his exertions that society owes much of its success. He published *Observations in Europe, principally in France and Great Britain*, and a similar work on Palestine, Syria, and Egypt.

DÜREN (the Roman Marcodurum, whence its former name, Mark-Duren), an ancient t. of Rhenish Prussia, situated on the Roer, 18 m. e. of Aix-la-Chapelle. It is surrounded with walls, and has several churches remarkable for their fine architecture. D. has important manufactures of woolen cloths, iron and steel ware, paper, soap, leather, oil, etc. In the vicinity are iron foundries and other factories worked by water-power, obtained from the Roer. Pop. '75, 14,542. Here Charlemagne, on his way to attack the Saxons, held diets in 775 and 779, A.D. After an obstinate resistance, D. was taken and burned by Charles V. in 1543. In 1794, the French made it the capital of the department of the Roer; but in 1814 it was handed over to Prussia.

DÜRER, ALBERT, the father of the German school of painting, "the prince of artists," as his countrymen loved to call him, was born at Nürnberg in 1471, according to an entry in his father's day-book, "on the day of St. Prudentius, on a Friday of the holy week." His father was a humble pious goldsmith, of whom the great painter said: "His daily speech to us was, that we should abound in love to God, and act faithfully towards our neighbor." D. was carefully educated and instructed by his father in the goldsmith trade, and at 15 executed a piece of work in chased silver representing the seven "falls of Christ"—in reference to the tradition that Christ fell seven times while bearing his cross to Mt. Calvary. Even as a child, drawing was his delight, and he was wont to astonish by the exactness with which he drew parts of the human body, and even whole figures, also lines and circles at the first stroke, without ruler or compass. His father therefore bound him apprentice, in 1486, to Michael Wohlgemuth, the chief Nürnberg artist, with whom he served three years. From 1490 to 1494 he traveled in Germany and the Venetian states; and on his return, his father "bargained" with Hans Frei, a skillful mechanic of Nürnberg to give him to wife his daughter Agnes, who turned out a perfect Xantippe, with nothing to recommend her but beauty and 200 florins, who embittered the whole course of his life, and, as his life-long friend Pirkheimer asserts, hastened his death. After receiving his diploma with all the honors and rights of a master, obtained for his famous drawing of Orpheus, he went to Venice in 1505, where he painted a picture of the martyrdom of St. Bartholomew, and one of Adam and Eve, afterwards bought for the gallery at Prague. He also visited Bologna, where it is said that he met with Raphael, who esteemed him highly, and that each painted for the other his portrait. After this journey, his fame spread widely, and the Emperor Maximilian appointed him court painter, with an annuity of 100 florins; and Charles V. confirmed the same in a document still to be seen in the Nürnberg archives. In 1520, he visited the Netherlands with his wife and their maid-servant; and they were splendidly entertained at Antwerp and Bruges by the painters, a costly dinner being served on vessels of silver, the whole party conducting them home late in the night by the light of many torches. His expenses were often defrayed at the inns, and he was escorted free from city to city. He says in his journal: "The people did obeisance unto me as if they were leading some great lord." D. warmly embraced the doctrines of the Reformation; and his journal contains a long lamentation and prayer on hearing that Luther had been carried off to the castle of Wartburg. At Antwerp he records: "I was now overcome by a strange sickness, of which I never yet heard from any man."

This was in 1521, and the "strange sickness"—no other than consumption—took yet seven years to consume his strong frame; he d. in his native city, 6th April, 1528, in his 57th year.

D's facility was almost incredible. He *thought out* his works, and then executed them without sketch, and never altered a line. Of his coloring, Fuseli says: "Düer excelled Raphael in juice and breadth of coloring as much as Raphael excelled him in every other quality." His drawing was perfect. So quaint were the presentments of his genius, he may be called the Chaucer of painting. In his portraits, he not only caught the expression, but delineated character and passion. D. was the inventor of the art of etching. He found wood-engraving in its infancy, and raised it to be a pattern for all times; he also discovered the method of bringing out wood-cuts in two colors. Historical and other paintings by D. are to be seen at Vienna, Munich, Prague, Dresden, and Nürnberg. The oldest of his pictures extant is the portrait of himself of the year 1498, in the Florentine gallery. His engravings and wood-cuts are so numerous, that with all his surpassing diligence it is known that for many of them he only gave the designs: 262 wood-cuts are known marked with his name, the most famous of which are the "Great Passion," the "Little Passion," his favorite work, the "Revelation of St. John," and the series called the "Triumph of Maximilian," a copy of which is in the Advocates' Library in Edinburgh. In the British museum, there is a volume with more than 200 original drawings by D., formeriy in the collection of sir Hans Sloane, also an exquisite carving in hone-stone, of the birth of St. John, and a number of engravings, bequeathed by Mr. Nollekens. His own list of his works enumerates 1,254 pieces.

In the last three years of his life he published works on perspective and measurement, on fortification, and on human proportion, of which last he only lived to correct the first volume. His life has been written by Heller, Roth, Campe, and others; in English by W. B. Scott and Mrs. Heaton. Deeply religious and reverent, he was also of a cheerful temperament, and was long chief magistrate of his native t., where there is a brass statue of him, designed by the famous sculptor Rauch, and his house is still to be seen at the corner of a street called by his name.

DU'RESS, in English law, is the plea of a man who has obliged himself to pay or perform, or who has committed a misdemeanor, that he was constrained to do so, and therefore ought to be free from the consequences. There is both *duress* of *imprisonment* and D. *per minas*.

DURESS (*ante*), a legal term, signifying personal restraint, or fear of personal injury or imprisonment, imposed upon a person to constrain him to perform some act injurious to himself or another; as when a man's life is threatened or his liberty restrained to compel him to sign a bond, or to relinquish some right, or to commit a misdemeanor. A bond signed under D. is voidable in law. The same is the case when the violence or the threat thereof is exercised on the wife, or husband, or other near kindred of the contracting party. The violence or threats must be such as are fitted to operate upon a person of ordinary firmness and to inspire a genuine fear. If a man's goods be in D.—that is unlawfully detained—and he pay money under protest to release them, a suit will lie for its recovery.

DURFEE, JOB, LL.D., 1790–1847; b. and d. in R. I. He graduated at Brown university in 1813; studied law; was elected to congress in 1820, and served four years; was chosen a number of times to the state legislature, and in 1828 was speaker of the lower house. In 1833, he was appointed associate justice of the state supreme court, and became chief-justice in 1835. He was the author of *What Cheer*, a poem in nine cantos, and of *Panidea*, a treatise to prove the presence of God throughout all nature.

D'UR'FEY, THOMAS, a writer of plays and poems in the reign of Charles II., with whom he was a favorite for his wit, liveliness, and songs. In literature, he is best remembered for his collection of songs, entitled *Pills to Purge Melancholy*, a work found only among the rarities of private libraries. Tom D., as he was usually called, lived to entertain queen Anne by singing his catches and glees; but being without any settled means of support, he concluded his career in poor circumstances. Addison, who was his friend, pleaded in his behalf—"He has made the world merry, and I hope they will make him easy, as long as he stays among us. This I will take upon me to say, they cannot do a kindness to a more diverting companion, or a more cheerful, honest, good-natured man." He died at an advanced age in 1723.

DUR'GA PU'JA. See UMA.

DURHAM, a co. in Ontario, dominion of Canada, on lake Ontario, intersected by the Grand Trunk and Midland railroads; 620 sq.m.; pop. '71, 37,381. Chief town, Port Hope.

DURHAM, a maritime co. of the n.e. of England, between the Tyne and Tees, bounded n. by Northumberland, e. by the German ocean, s. by Yorkshire, w. by Cumberland and Westmoreland. It is 48 m. long, by 39 broad, with 32 m. of coast, generally low, but with some cliffs; area, 973 sq.m., five sevenths being arable. The surface is hilly, and slopes to the east. In the w., which is waste but rich in minerals, are branches of the Pennine chain, rising in Kilhope law, 2,196 ft.; Colber law, 1678; and Pontop pike, 1018. The two chief branches inclose the valley of the Wear, and send forth several parallel ranges, declining toward the coast, and inclosing many fertile

tracts and sheltered valleys. The chief rivers are the Wear, Tyne, and Tees, navigable respectively for 12, 15, and 10 miles. The rocks are new red sandstone, magnesian limestone, millstone grit, carboniferous limestone, rich in lead; and coal-measures, forming the valuable D. coal-field, 25 by 10 m., with many faults, and with about 40 beds of coal, 3 to 10 ft. thick. Basalt and greenstone trap dikes intersect the w. part of Durham. The mineral products are coal, limestone, black marble, freestone, ironstone, firestone, slate, millstone, grindstone, and lead. Large furnaces for the production of iron are in operation in various parts of the county. D. is one of the chief counties in England for the production and export of coal: 500 ships, besides a fleet of steamers, are employed at Sunderland for this export alone. There are 240 collieries. Five of the coal-seams, at the depth of 20 to 100 fathoms, are worked horizontally for many miles: 212 miles of railway connect the mines and ports. The soil is a clayey or dry loam. The chief crops are oats, barley, wheat, turnips, beans, and pease. The Teeswater or Holderness breed of cattle is famed for fattening, quantity of milk, and early maturity. The D. horses are famed for draught and the saddle. Many sheep are pastured on the hills. There are manufactures of iron, pottery, glass, alkalies and chemicals, and salt, and much ship-building at Sunderland, South Shields, Jarrow, Hartlepool, and Stockton. Coal is the chief export. D. is divided into four wards, 15 poor-law unions, and 60 parishes, many of which have been subdivided, owing to the increase of population. In 1871, the pop. amounted to 685,089, being almost double of what it was in 1851. The chief towns are Durham, the co. town, Sunderland, Darlington, Gateshead, South Shields, Stockton, and Hartlepool. The co. sends four members to parliament. D. has some ancient barrows, and has afforded many Roman antiquities, as altars, urns, and coins. There are the remains of a fine Roman station at Lanchester. D. formed part of the Saxon kingdom of Northumbria (5-7 to 827). Subsequently, it suffered severely from the incursions of the Scots.

DURHAM COUNTY PALATINE, one of the three counties palatine of England, the other two being Lancaster and Chester. For the privileges of a co. palatine, see PALATINE. The co. palatine of D. existed by prescription. It was the only co. palatine in the hands of a subject, and belonged to the bishop of Durham. By 6 and 7 Will. IV. c. 19, the co. palatine of D. is separated from the bishopric, and vested in the crown.

DURHAM, a parliamentary and municipal borough, and ancient episcopal city of England, near the middle of Durham co., built around a steep rocky hill 86 ft. high, nearly encircled by the Wear. On the top of the hill are the cathedral and castle. Ancient walls partly inclose the hill, from which are fine views of the fertile wooded country around, and of the suburbs across the river. The chief manufactures of D. are carpets, paper, and iron. In the vicinity are coal-mines, and saline, chalybeate, and sulphureous springs. Pop. '71, 14,406. It sends two members to parliament. D. arose about the year 995, when bishop Aldune brought here St. Cuthbert's bones from Ripon, and built a church to enshrine them. On the site of this church, bishop William de Carilepho, about 1093, began the present magnificent cathedral, a Romanesque structure in the form of a Latin cross, to which additions continued to be made till about 1500. It thus exhibits the gradual changes of style between these periods. It was restored during last century, and has lately undergone extensive renovation. It is 507 by 200 ft., with a central tower 214 ft. high, and two west towers 138 ft. high. The cathedral contains many old monuments. Here lie St. Cuthbert's (q.v.) remains. Here also are Bede's tomb and some manuscripts said to be in his hand-writing. Cardinal Wolsey was a prelate here. The bishop's income is now £8,000. The castle, formerly the residence of the bishops of D., but now the seat of the university of D., was founded about 1072, by William the conqueror, in the Romanesque style, but it has since been much altered. The dormitory, now the new library of the cathedral, which belonged to the monastery of D., is one of the finest in England. Two of the bridges over the Wear were erected in the 12th century. D. was often attacked by the Scots.

A college was founded here in 1290 by the prior and convent of Durham. It was abolished, however, at the dissolution of monastic houses in the reign of Henry VIII., and its endowments given to the dean and chapter of Durham. Under the commonwealth, Cromwell instituted a college here, and endowed it with the sequestrated revenues of the dean and chapter, to whom, however, these revenues again reverted at the restoration, when the college was suppressed. The present university of D. was opened for students in 1833, under the provisions of an act of parliament, obtained by the dean and chapter during the previous year. A royal charter in 1837 empowered the university to bestow degrees. The D. university comprises professorships in divinity and ecclesiastical history, classical literature, mathematics and astronomy, and medicine, with lectureships in Hebrew, classical literature, etc. It has two colleges—University college, and bishop Hatfield's hall.

DURHAM, JOHN GEORGE LAMBTON, Earl of, an English statesman, was the son of William Henry Lambton, esq., of Lambton hall, county of Durham, and was born at the family seat, 12th April, 1792. The Lambton estate was not very large, but had been in the possession of the family since the 12th c., the male issue having never once failed during all that period. The antiquity of the family, however, exercised no narrowing influence on his opinions, which were markedly radical. He was educated at

Eton; and when only twenty years of age, married at Gretna Green a Miss Harriet Cholmondeley, who died in the course of a few years. In 1814, he was returned for his native county, and though he did not speak on many questions, he took part in all the more important debates, opposing the corn-law bill of 1815, the additions made to the incomes of the royal dukes, the indemnity bill of 1818, the six repressive bills brought in by government to coerce the people after the great reform meeting at Manchester in 1819, etc. Two years after, he submitted to the house of commons a scheme of parliamentary reform, which of course was not accepted. In 1828, he was raised to the peerage, with the title of Baron Durham of the city of Durham. He was one of the four persons who drew up the reform bill, and supported it in the house of lords. In 1833, lord D. was dispatched on a mission to Russia. On his return to this country, his "advanced liberalism" was proclaimed at a dinner given to lord Grey at Edinburgh, in 1834, and in various other parts of the country. After a second mission to Russia, he was appointed governor-general of Canada, where he arrived in May, 1839; but on account of a misunderstanding with the home government, he took the extraordinary step of returning to England in the course of half a year, without either being recalled or obtaining the royal consent. D. died at Cowes, Isle of Wight, 28th July, 1840. He left a son, the present earl of Durham, and three daughters.

DU'RIAN, or DURION, *Durio zibethinus*, a fruit-tree of the Malayan archipelago, of the natural order *sterculiaceæ*, of the same tribe or sub-order (*bombaceæ*) with the silk-cotton tree. It is a lofty tree, with leaves resembling those of the cherry, and large bunches of pale-yellow flowers. The fruit is of the size of a man's head, roundish oblong, with a hard thick rind, covered with soft spines, so that it somewhat resembles a hedgehog rolled up. The pulp of the fruit is of a sort of creamy substance and delicious taste, but has a smell which is at first very repulsive to Europeans. Persons accustomed to it, however, universally regard the D. as one of the very finest fruits of the east. It brings a higher price than any other fruit in the market in India. It contains 10 or 12 seeds, as large as pigeons' eggs, which, when roasted, are not inferior to chestnuts. One tree yields about 200 durians in a year.—The cultivation of the D. has not yet been successfully attempted in our hot-houses, the great size of the tree forming one principal obstacle to it. The D. is not a native of India, nor of Ceylon, but is now successfully cultivated in the latter country.

DÜRKHEIM, a t. of Rhenish Bavaria, on the Isenach, 20 m. n. from Landau. It stands at the entrance of the valley of the Isenach, at the base of hills which skirt the plain of the Rhine, and the neighborhood is very beautiful. Many invalids resort to D. on account of its amenity, and to take the *grape-cure*. It has manufactures of tobacco, cutlery, and paper. D. was formerly the residence of the princes of Leiningen-Hardenburg, whose palace was burned by the French in 1794. Not far off are the salt-works of Phillipshall. The summit of a neighboring height is crowned by a rampart of loose stones, 6 to 10 ft. high, 60 to 70 ft. wide at the base, and inclosing a space of about two sq.m., called the Heidenmauer (heathens' wall), which the Romans are said to have built to keep the barbarians in check, and where Attila is said to have passed a winter, after having wrested the fortress from the Romans, when pressing on his way to Rome. Pop. '75, 5,848.

DURLACH, an old t. of Germany, in the grand-duchy of Baden, is situated on the river Pfinz, at the base of the Thurmberg, a highly cultivated hill, 3 m. e. of Carlsruhe. D. manufactures linen, tobacco, chicory, vinegar, and machinery, and has extensive fruit and grain markets. The environs abound with orchards. On the summit of the Thurmberg are the ruins of an old castle. D. is a station on the Mannheim and Basel railway. Pop. '75, 6,782.

DUROC, GÉRARD CHRISTOPHE MICHEL, 1772–1813; Duke of Friuli; a French gen. who served in the wars of the revolution, in the army of Italy, and in the Egyptian campaign. He was a prominent actor in the overthrow of the directory, and was appointed lieut.-gen. and governor of the Tuileries. He went on diplomatic service to Sweden, Denmark, Russia, Prussia, and Saxony. In the battle of Austerlitz he was Oudinot's successor; and was near Napoleon in the subsequent campaigns. At the battle of Bautzen, while escorting Napoleon to a position that would overlook the field, Duroc was struck by a cannon-ball, and died soon afterwards. Napoleon afterwards bought the house where he died, and built on the spot a monument to his memory.

DURRA, DOURA, DURRA MILLET, INDIAN MILLET, or SORGHO GRASS, *Sorghum*, a genus of grasses, distinguished from *andropogon*—in which many botanists prefer to include it—only by the ovate or oblongo-ovate hermaphrodite spikelets, with glumes that have three small teeth at the extremity. The species are generally annual, tall, broad-leaved grasses, having strong culms filled with a juicy and saccharine pith, and large panicles. Several of them are cultivated as corn-plants chiefly in Asia and Africa, particularly the common D. (*S. vulgare*, or *andropogon sorghum*, *holcus sorghum* of the older botanists), also called *joar* and *jowaree* in India. It grows 4 to 8 ft. high, with thickly crowded panicles. It is a coarse, strong grass; its grain is round, a little larger than mustard seed. It is a native of the East Indies, is extensively cultivated in Asia, and may perhaps be described as the principal corn-plant of Africa. It is also cultivated to a considerable

extent in the s. of Europe. It is sometimes cultivated in Germany, but the summer is not sufficiently long and warm to secure its greatest perfection. The climate of Britain is still less suitable. D. yields a very abundant produce, in this respect even rivaling maize, but the meal does not make good bread; it is excellent, however, instead of rice for puddings, and is prepared in various ways for food. The culms and leaves, although coarse, are excellent food for horses and cattle, as is also the grain.—The seeds of the SHALOO or SUGAR-GRASS (*S. saccharatum*) are more pleasant to the taste than those of the common durra. It is cultivated in the warm parts of Asia and in Africa, and has a diffuse and very spreading panicle. The sweet pith of the culm is eaten, and is also of value as a source of sugar. This plant has been cultivated to some extent in the Veronese, and its cultivation has been recently introduced into North America—where it is called CHINESE SUGAR-CANE—in order to the production of sugar. It seems likely to form an important new feature in American agriculture, succeeding well at least as far n. as Maine, and yielding sugar in large quantity. In Britain, it succeeds only in the warmest parts. As a forage plant, it is very nutritious when young.—KAFFER CORN (*S. Caffrorum*) has a very diffuse umbel-like panicle, with branches bending down all around. The culm is more than the height of a man, and has a sweet pith. This species is largely cultivated in s. Africa, both by Kaffers and by the colonists. By the latter, the grain is chiefly used for feeding horses.—*S. halepense* is a troublesome weed in the fields of the n. of Italy, like couch-grass. The sweet runners of the roots are kept by the apothecaries of that country as a substitute for sarsaparilla, under the name of *garmignone*, or *smilace dolce*.

DÜRRENBERG, a small t. of Prussian Saxony, 5 m. s.e. of Merseburg, deserves mention only for its salt springs, which produce about 250,000 bushels of salt annually. Pop. '71, 202.

DÜRRENSTEIN, a village of lower Austria, is situated in a highly picturesque locality, on the left bank of the Danube, about 45 m. w.n.w. of Vienna. It is chiefly notable for the ruins of a castle, which stand upon a ridge of bare rock overlooking the town. A peculiar interest attaches to this grand but desolate and shattered fortress, from its having been the prison in which Richard Cœur-de-Lion was confined by Leopold of Austria, for 15 months. Pop. 650.

DURSLEY, a t. in the w. of Gloucestershire, amid picturesque scenery, at the base of a steep beech-covered hill, and near the Coteswold hills, 15 m. s.s.w. of Gloucester. It is irregularly built, and chiefly consists of three streets, diverging in different directions from the market-place. Pop. '71, 2,413. In the oolitic and lias formation in the vicinity is a quarry of tophies or puffstone, which is a soft and easily worked stone, but hardens on exposure to the air.

DURUY, VICTOR, historical writer, ex-professor, and ex-minister of public instruction in France, was b. at Paris in 1811. Members of his family were employed as designers in the lace-works at Gobelins, and he was, in his boyhood, intended to follow their occupation. He was, on this account, somewhat late in beginning his classical studies, which he did at the college Rollin, then called the college Sainte-Barbe; but the progress he made was rapid enough to enable him to enter the Ecole Normale in his 19th year. Here his career was sufficiently distinguished to obtain for him, in 1833, in succession, the position of teacher of history in the college of Rheims—which he only held for two months—and that of teacher or professor of history at Paris, in the college Henri Quatre, afterwards called the college Napoleon. This college (as well as the former) is a school of secondary instruction, in which history forms part of the programme of studies of the second (the next to the highest) class. The post which D. obtained in it was therefore by no means a high one. He continued to fill it till 1861. He had meanwhile gained a considerable reputation as a teacher of history, and as a writer on history and geography. Most of his books were school-books, but they were so good that they had a great influence upon the teaching of history in French schools. He got the degree of doctor of letters in 1853. In 1861 and the following year, he passed through a rapid course of promotion. He was first appointed an academy-inspector of the academy of Paris (an inspector of schools of secondary instruction in the district under the jurisdiction of that academy); next, master of conferences at the Ecole Normale; then inspector-general of secondary instruction; and, finally, professor of history in the Ecole Polytechnique. From the last-named post he was, on the 23d June, 1863, by imperial decree, advanced to the office of minister of public instruction.

D., who, by activity and ability combined, had made himself distinguished while filling a somewhat humble office, was no sooner charged with the control of public instruction, than he began to carry out important changes in the educational system of France—which had undergone scarcely any modification since the introduction of Guizot's education law in 1833. He instituted a tribunal for trying charges brought against professors. He remodeled the examinations for the degree of bachelor of letters. He first suspended, and afterwards abolished, the division of the highest class, which had prevailed in schools of secondary instruction, into two sections: the one rhetorical or literary, the other philosophical (scientific)—thus making the study of science obligatory upon all who passed through the school curriculum. He introduced other changes into the course of secondary instruction, of which the most important—at any rate, that

which has been most discussed—was the teaching of contemporary history in the lyceums, or departmental public schools. Previously, the text-books used in teaching history in these schools were Bossuet's *Histoire Universelle* and Montesquieu's *Grandeur et Décadence des Romains*—these works being supplemented by the lectures of the professor. D. had a text-book prepared for their use, containing a compendium of French history to so late a period as that of the recent French invasion of Mexico; and it has been alleged that this work, and the circulars which the minister published for the instruction of teachers of history, disclosed a systematic attempt to imbue the youth of France with a Bonapartist view of recent history—to make the teaching of the schools a source of future strength to the empire. Perhaps it would be difficult altogether to acquit D. of the Machiavellian design imputed to him. As to primary instruction, he officially proposed to the emperor to make it compulsory and gratuitous; but the proposal was badly received by the public, and the emperor withheld his sanction. He also procured legislative sanction for a measure which greatly increased the number of primary schools, especially of girls' schools, for which the provision made had previously been inadequate. The night-schools for adults, too, were greatly improved and extended under his care; and the educational libraries established in connection with them proved very effective aids to the education of the working-classes. He procured an enactment for establishing schools of special secondary instruction, intended mainly to teach the elements of science to boys of the lower middle class who are to be engaged in manufactures or commerce, and, in the country districts, to give systematic instruction in the methods of agriculture and horticulture.

The matters which have been mentioned are only a few of those which D., with bold and unsparing hand, leaving no part of the system of education untouched, dealt with while in office. It is unquestionable that he in many cases effected improvements; but the spirit and tendency of his administration were strongly impugned, and his conduct was jealously watched by the best portion of French society. It is alleged that he steadily attempted to secure the entire control of education for the state, and to use national schools as a state instrument. For example, the changes which he introduced in the examinations for the degree of bachelor of letters are said to have been intended to force candidates to study at the government establishments; and certainly, if their working has not been misrepresented, their tendency seems to be to place candidates educated elsewhere at a disadvantage. In such charges as this, there may be exaggeration or misconception; but D. is an ardent Bonapartist, and it is natural to suppose that he intended the results which his acts were calculated to produce. He resigned the office of minister of public instruction in 1869. He was decorated with the legion of honor in 1845, and was promoted to be officer, commander, and grand commander of that order. He has been an officer of the Turkish order of Medjidie since 1857.

Of D.'s numerous works, not a few were written for a series published under the title *L'Histoire Universelle*, of which D. was the editor. His earliest work, *Géographie Politique de la République Romaine et de l'Empire*, first appeared in 1838; it was followed by *Géographie Historique du Moyen Age* in 1839; *Géographie Historique de la France* in 1840; and *Atlas de Géographie Historique Universelle* in 1841. In 1840, he published the first volume of a work of greater pretensions than these—*Histoire des Romains et des Peuples soumis à leur Domination;* a second volume appeared in 1844; a third in 1853, under the title *L'Etat du Monde Romain vers la Fondation de l'Empire;* but the work appears to be still incomplete. *Histoire Sainte d'après la Bible* (1845), *Histoire Romaine* (1848), *Histoire de France* (1852), *Histoire Grecque* (1851), were among his subsequent productions. In 1862, appeared two volumes of his *Histoire de la Grèce Ancienne*, a work which has been crowned by the French academy. *Histoire Moderne* (1863), *Histoire Populaire de la France* (1863), *Histoire Populaire Contemporaine* (1864), *Introduction Générale à l'Histoire de France* (1865), were works prepared under his direction, and some of them partly consisting of extracts from his previous writings on French history.

DURYEA, JOSEPH TUTHILL, D.D., b. Long island, N. Y., 1832; a graduate of the college of New Jersey, where he was teacher of Greek and rhetoric; in 1859, graduated at Princeton theological seminary; pastor of a Presbyterian church, Troy, N. Y., 1859–62; in 1862–68, associate minister of the Collegiate Reformed church of New York; in 1868–79, pastor of Classon avenue Presbyterian church, Brooklyn; since 1879, pastor of the Central Congregational church, Boston. He is a broad and deep thinker, and his literary style is careful and finished, though his preaching is mostly without notes.

DUSICYON, a genus of *canidæ*, or sub-genus of *canis* (dog), consisting of a number of South American species or varieties, sometimes called aguara dogs. They have the body rather long in proportion to their height, and of considerable bulk, the muzzle rather sharp, eyes somewhat oblique, and aspect somewhat fox-like, the tail also has a more or less perfect fox-like brush. They are more diurnal than nocturnal in their habits, live in burrows, and feed on birds and small quadrupeds. Some of them have been domesticated by the Indians.—Akin to the aguara dogs, but more fox-like, are the aguara foxes (cerdocyon, q.v.).

DUSKY BAY, a large inlet on the s.w. coast of Middle isle, in New Zealand, is in lat. 45° 40′ s., and long. 166° 20′ east. It was entered by Cook in 1769, who here found good anchorage.

DÜSSELDORF, the chief t. of the district of Düsseldorf, in Rhenish Prussia, and the capital of the former duchy of Berg, is situated in the center of a fertile district, on the right bank of the Rhine, at the confluence of the Düssel with that river, in lat. 51° 13′ n., long. 6° 45′ east. It was formerly fortified, but its ramparts were converted into gardens and promenades at the treaty of Luneville, 1802. It is seated in the midst of extensive garden-grounds, and is well built. The streets, the houses of which are built of brick, are regular and spacious; while the rows of trees with which many of them are planted, greatly enhance their appearance. D. is divided into the *Altstadt*, on the right bank of the Düssel; the *Karlstadt*, founded in 1786 by the elector Karl Theodore, on the left bank; the *Neustadt*, on the Rhine; and the recently built *Friedrichstadt*, to the south. A colossal equestrian statue of the elector Johann Wilhelm, who founded a famous picture-gallery here in 1710—the pictures of which, however, were removed to Munich in 1805—stands in one of the five squares of Düsseldorf. The Düsseldorf academy was founded in 1767, reorganized in 1822, and attained great eminence during the years 1822-26, under the management of Cornelius and Schadow. The art-union for the Rhine provinces and Westphalia was founded here in 1828. The principal buildings of D. are the old electoral palace; the present palace, the residence of the governor of the province; the government house, the observatory, town-hall (built in 1567), theater, gymnasium, and public library. Of the ecclesiastical edifices, the most remarkable are the churches of St. Andrew and St. Lambert, and the church of the Jesuits, a handsome and highly ornate structure, having two steeples. The Hofgarten, one of the finest public gardens in Germany, is a very agreeable promenade. D. has manufactures of woolens, cottons, leather, hats, tobacco, jewelry, mirrors, railway carriages, etc., and its trade and industries generally are steadily progressing. A great part of its importance may be said to be derived from its position on the Rhine, as on this account great quantities of goods are sent to D. from the surrounding districts for exportation. Pop. '75, 80,695, most of whom are Catholics. Along with the duchy of Berg, D. came into the possession of Prussia in 1815. It was made a free port in 1829, and since that time it has prospered. It has daily communication with Mayence and Rotterdam by the Rhine steamers. Industry and commerce have likewise received a new impulse since D. became the central point of several lines of railway.

DÜSSELDORF SCHOOL OF PAINTING. This institution, founded in Düsseldorf by prince Charles Theodore in 1767, did not become famous until, in 1822, it was reorganized by king Frederick William, and put in charge of Cornelius, under whose direction it took at once a high rank. Cornelius was succeeded in 1826 by Schadow, and in 1859 by Bendeman. From 1864, the institution was managed by curators, till in 1873, Wiscelinus of Weimar was chosen director. The school has exerted a wide influence upon art, in America as well as in Europe. Several of the most famous American artists have studied there, and among those who have done much to introduce and popularize its methods and style in this country may be mentioned Eastman Johnson, George H. Hall, Leutze, and Bierstadt. The academy possesses 14,000 original drawings and sketches by the great masters, and 24,000 engravings. The German artists whose names have become most familiar in connection with the school are Cornelius, Lessing, Achenbach, Baur, Tidemann, and Knaus.

DUST-BRAND. See SMUT.

DUS'TEE, the largest river of Beloochistan, enters the Arabian sea, in lat. 25° 3′ n., and long. 61° 45′ east. In proportion to length, it is certainly the least considerable stream in existence. It is about 1000 m. long; and yet it has been found to be, at its mouth, 20 in. deep, and 20 yards wide. During its entire course, it is, in its permanent character, remarkably shallow; and, in fact, the watercourses of the country depend, without exception, almost exclusively on the rainy season.

DUS'TY-FOOT was a court of summary jurisdiction established at fairs in England for the speedy determination of questions arising between those who resorted to the fair. See PIEPOWDER COURT.

DUTCHESS, a co. in s.e. New York, on the e. side of the Hudson river, crossed by the Hudson river, the Harlem, the Dutchess and Columbia, and the Poughkeepsie and Eastern railroads; 810 sq.m.; pop. '75, 76,334; in '80, 79,273. It has a rolling and in some places hilly surface, and the soil is for the most part very fertile. Wappinger falls and Fishkill creek supply water-power. Limestone, slate, and marble are abundant, and lead and iron are found in some places. The productions are wheat, rye, corn, oats, buckwheat, potatoes, hay, garden vegetables, butter, fruit, etc. There are in the co. about 900 manufacturing establishments. Co. seat, Poughkeepsie.

DUTCH GOLD is an alloy of copper and zinc, in the proportion of 3 or 4 ozs. of zinc to 1 lb. of copper. It can be beaten out into thin leaves resembling gold-leaf, when it receives the name of *Dutch gold-leaf*, and almost rivals gold in appearance. It is very liable to be tarnished by gases, such as hydrosulphuric acid (sulphuretted hydrogen), which are constantly present in the air, especially in town districts, and it may be distinguished from true gold-leaf by the action of strong nitric acid, which instantly dissolves D. G., and leaves true gold unaffected.

DUTCH LANGUAGE AND LITERATURE (NETHERLANDS, *ante*). Dutch is the written dialect of the inhabitants of the Netherlands. It belongs to the Aryan family of languages and to the Teutonic division thereof. The alphabet consists of the same letters as the English, the vowels having essentially the same sound as in French. In the inflection of the nouns and in the general construction of words and sentences the language strongly resembles the German. The plural of the noun is usually formed by adding en or n to the singular. The language is characterized by great simplicity, directness, and force, the greater breadth of its inflections giving it some advantage over the English. It has great facilities for the formation of compound words, often a great convenience. In this respect it is superior even to the German. In many instances where the English are compelled in the formation of a technical word to borrow from the Latin or Greek, the Dutch resort to their own indigenous roots. Many nautical terms and phrases in common use among the English are derived from the Dutch. Some specimens of the Dutch language date as far back as the 9th century. They resemble low German, and show that the language had its origin in the same source as all the other Teutonic dialects. It is almost identical with the Flemish, the differences being mainly in orthography and pronunciation. Dutch literature, as distinguished from the Flemish, dates no further back than 1570. It has had, however, a very striking development. Among the distinguished scholars of the nation in the past may be mentioned Erasmus, Grotius, Arminius, Spinoza, and Boërhaave. In the earlier portion of the 17th c., the free commonwealth of Holland was distinguished above every other European nation for its devotion to literature, and it can hardly be said to have fallen much in the rear since that day. The nation has had and still has its eminent poets, historians, travelers, philosophers, scientists, and theologians, whose works have attained a high rank.

DUTCH LIQUID is an oily substance obtained by mixing chlorine and olefiant gases, which combine together and yield D. L., with the formula $C_4H_4Cl_2$. It has a specific gravity of 1280 (water=1000), boils at 184° F., is not miscible with water, but readily dissolves in ether and alcohol. It possesses the power of producing anæsthesia (q.v.), just as chloroform (q.v.) does; but the great difficulty of preparing D. L. in commercial quantities must retard its employment as an anæsthetic.

DUTCH REFORMED CHURCH. See REFORMED CHURCH IN AMERICA.

DUTCH RUSHES. See EQUISETUM.

DUTCH SCHOOL OF PAINTING. This school holds a high and honorable place in the history of art, being marked by many excellences and illustrated by many eminent names. The school took its rise in a divergence from the schools of Germany at the beginning of the 15th century. Its founders were Hubert and Jan van Eyck, who united the majestic simplicity of the ancient Christian type with a close imitation of external nature and a homely strength characteristic of their country. Hubert van Eyck improved the method of painting in oil to such an extent that he is almost entitled to the honor of being its inventor. The altar-piece in St. Bavo, at Ghent, is the work of the brothers van Eyck. In its complete form it consisted of a center picture of the Worship of the Lamb, surmounted by pictures of God the Father, the Virgin, and St. John, and flanked by folding shutters relating to the principal subject. The parts of this picture—one of the most remarkable productions of modern art—are now separated, the upper and middle portions remaining at Ghent, the others being at Berlin. Two of Hubert van Eyck's most important works are his "Triumph of the Church" in the museum at Madrid, and "St. Jerome" in the gallery at Naples. An admirable specimen of Jan van Eyck's work is a picture of a man and woman in the British national gallery. The influence of these brothers was very extensive. Their pupils were numerous, and of them all, Rogier van der Weyden, who died in 1464, was the most eminent. "The Last Judgment," in the hospital of Beaume, and the "Adoration of the Kings," at Munich, are his. Memling, one of his pupils, was remarkable for the refinement of feeling and the beauty of form displayed in his pictures. Some beautiful specimens of his work are in St. John's hospital, Bruges. "The Last Judgment" in the church of Our Lady, at Dantzic, is probably the best production of his pencil. His influence extended till nearly the end of the 16th century. Quentin Matsys was one of the earliest painters of those homely subjects of which so many examples are found in the Dutch school. His masterpiece, a "Deposition from the Cross," is in the Antwerp museum. Among the portrait painters of the Dutch school in the 16th c., several attained eminence in England. At the beginning of the 17th c. appeared the celebrated Rubens, the herald of a great revival of painting. His forms are gross, but full of life and power. His works are numerous, and specimens are to be found in almost every continental gallery. They may be studied to best advantage at Antwerp, Vienna, and Munich. His "Descent from the Cross," and its companion in the cathedral of Antwerp, are among his best productions. Vandyck, the celebrated portrait painter, was a pupil of Rubens. Some of his best work was done in England. The greatest of the Dutch painters, however, was Rembrandt, whose mastery of light and shade was wonderful, and whose works are now among the most precious treasures of art. His engravings are of equal merit with his paintings. The masters in *genre*, by which is meant the every-day life in art as contrasted with the grandeur of historical

or devotional works, have been numerous in the Netherlands. In this department, Teniers, the elder and the younger, are eminent. Gerard Dow, a pupil of Rembrandt, was also celebrated in this line. Among the most noted marine painters of the Dutch school were Bonaventura Peters and Ludolph Backhuysen. In the 18th c., there was in Flanders and Holland, as well as elsewhere, a decline in the artistic spirit, which was followed in the 19th by a revival.

DUTENS, Louis, a French writer, was b. at Tours, 16th Jan., 1730. Being a Protestant, he sought to make his way in England, and occupied himself at first in teaching and in self-improvement. At last, he accompanied the English ambassador to the court of Turin as his secretary, and afterwards remained as *chargé-d'affaires*, a position which he occupied twice subsequently. He held a pension, and was presented to the rich living of Elsdon, in Northumberland; and was likewise made historiographer-royal of Great Britain. He died in 1812. His numerous works display great versatility and knowledge of the world. He undertook the first comprehensive, though not complete, edition of Leibnitz's works (6 vols., Geneva, 1769). In his *Recherches sur l'Origine des Découvertes attribuées aux Modernes* (2 vols., 1766), he rates the knowledge and invention of the ancients by far too high. The *Tocsin* (Rome, 1769), which afterwards appeared under the title of *Appel au Bon Sens* (Lond. 1777), contains some sharp attacks on Voltaire and Rousseau. There is considerable historical interest in his *Histoire de ce qui s'est passé pour le Rétablissement d'une Régence en Angleterre* (Lond. 1789). He also wrote several able treatises on numismatics and other subjects. In the *Considérations Théologiques sur les Moyens de réunir toutes les Eglises Chrétiennes* (Par. 1798), he proposed that a council should compose a confession of faith grounded on the decrees of the councils of the first six centuries. His *Mémoires d'un Voyageur qui se repose* (Par. 1806) met with general favor.

DUTIES. See Customs.

DUTROCHET, René Joachim Henri, an eminent French physiologist and physician, was b. at the Château de Néon (Poitou), 14th Nov., 1776, and came to Paris in 1802, to study medicine. His career as a student was brilliant, and in 1808 he was appointed military physician to Joseph Bonaparte, king of Spain. Soon after, he became physician-in-chief of the hospital of Burgos, then devastated by typhus fever. Returning to France in 1809, he gave himself up exclusively to the study of nature, and published a series of works on physics and physiology, full of new ideas. In 1819, he became a correspondent of the royal academy of science; in 1823, of the royal academy of medicine; and in 1831, a member of the former. He died 4th Feb., 1847. The substance of all D.'s investigations and discoveries is contained in his *Mémoires pour servir à l'Histoire Anatomique et Physiologique des Végétaux et des Animaux* (Paris, 1837). He is best known by his researches on the passages of fluids through animal and vegetable substances. The passage of a fluid from without, inwards, he calls *endosmosis;* and from within, outwards, *exosmosis.* These terms have since been widely adopted by physiologists. See Diffusion of Liquids and Gases.

DUTTEEAH, the principality or raj of which the below-mentioned city is the capital, is a protected but not tributary state, extending in n. lat. from 25° 32′ to 26° 18′, and in e. long. from 78° 15′ to 78° 54′. It contains 850 sq.m., and 120,000 inhabitants. The revenue is fully £100,000; and the armed force numbers 6,000 men.

DUTTEEAH, a city of Bundelcund, in central India, lies between Agra and Saugor, being 125 m. to the s.e. of the former, and 148 to the n.w. of the latter. With a population of about 50,000, the place has many good houses, the residences of the principal zemindars or landholders of the neighborhood. Like most towns in Bundelcund (q.v.), D. has a rocky site; and it is surrounded by a stone wall 30 ft. high. The lat. and long. are 25° 40′ n., and 78° 31′ east.

DUTTON, Henry, ll.d., 1796–1869; b. Conn.; a graduate of Yale, and professor of law in that college. In 1854, he was elected governor of Connecticut; in 1861, he was judge of the superior court of errors. He compiled the statutes of the state, and prepared several digests.

DUTY. See Ethics.

DUUM'VIRS, officers among the Romans appointed for special services, such as magistrates of colonies and towns, constructors and commanders of fleets, and municipal censors. In the eastern empire the people elected for one year *duumviri ludorum,* who were to provide exhibitions of games at their own expense.

DUVAL', a co. in e. Florida, on the Atlantic, intersected by St. Johns river, and reached by the Jacksonville, Pensacola and Mobile and the Florida railroads; about 1000 sq.m.; pop. '70, 11,921—6,780 colored. The surface is level; chief productions, corn, sugar, and sweet potatoes. Co. seat, Jacksonville.

DUVAL', a co. in s.w. Texas, on the Rio Nueces; 1650 sq.m.; pop.'70, 1083. Stock-raising is the chief business. There is a railroad from Corpus Christi to the c. line of the county. Chief town, Concepcion.

DUVERGIER DE HAURANNE, Jean, 1581–1643; a French theologian, native of Bayonne; studied at Louvain, and was fellow-student with Jansen. About 1611, Duver-

gier was made canon at Bayonne. In 1620, he was made abbot of St. Cyran. In Paris he formed a connection with the influential Arnauld family, and, with Angelique Arnauld, directress of the convent of Port Royal, he completely reformed that institution. By taking a leading part in the Jansenist controversy, he excited the enmity of the Jesuits, and at last he was suspected by Richelieu, and thrown into prison in March, 1638. No evidence was found against him, but to break his strong influence he was kept confined until the death of Richelieu. He was then set free, and at once recommenced his war upon the Jesuits; but about six months afterwards died of apoplexy.

DUVERNOY, Georges Louis, 1777–1855; a French naturalist, invited in 1802 by Cuvier to assist in making the latter's treatise on comparative anatomy. Duvernoy prepared the last three volumes of the work. He practiced medicine for 20 years. In 1827, he was chosen professor of natural history at Strasburg, where he published several papers on anatomical themes. In 1837, he was professor of natural history in the college of France, and in 1850 occupied the chair of comparative anatomy.

DUVEYRIER, Henri, b. Paris, 1840. He was educated in Germany, and became acquainted with Dr. Barth, the African explorer. He made a trip to Africa in 1857–59, and published *Explorations of the Sahara.* In 1871, he served in the French army, and was for a time a prisoner of war.

DUXBURY, a t. in Plymouth co., Mass., on the n. shore of Plymouth harbor, reached by a branch of the South Shore railroad; 38 m. from Boston; pop. '70, 2,341. It is the landing place of the Atlantic cable from Brest, France. Fishing and ship-building are the leading industries.

DUYCKINCK, Evert Augustus, 1816–78; b. N. Y.; graduated at Columbia college, 1835; in 1840, editor of *Arcturus,* a monthly magazine; in 1847, he and his brother George started the *Literary World,* and continued it till 1853. In 1856, the brothers finished the *Cyclopædia of American Literature,* an elaborate work in two large volumes, to which, in 1865, Evert added a supplement. Among his publications are *Wit and Wisdom of Sydney Smith; Poems relating to the American Revolution; History of the War for the Union; National Portrait Gallery of Eminent Americans; History of the World from the Earliest Period to the Present Time;* and *Memoirs of Francis L. Hawks.*

DUYCKINCK, George Long, 1823–63; b. N. Y.; brother of Evert A.; graduate of the university of New York, 1843. Besides his work with his brother, he was the author of *George Herbert of Bemerton,* and of lives of bishop Thomas Ken, Jeremy Taylor, and Latimer.

DUYSE, Prudens van, a Belgian writer, was b. in Dendermonde, in Belgium, Sept. 28, 1804. After completing his academical career, he was appointed archivist of his native town, from which he was removed to the same office in Ghent. He soon afterwards received the office of professor of national history in the athenæum, and was made a member of various learned societies both in Belgium and France. He died Nov. 13, 1859. D. was one of the chief contributors to the revival of Flemish literature. As a poet, he was less remarkable for genius than for prodigious fertility; his pieces all bear the stamp of improvisation, of which he was a great master. Several of his productions, both poetical and prose, obtained prizes from literary societies. Of 47 poetical publications issued by D. between 1836 and 1859, we may mention *Vaderlandsche Poëzy; Natalia; Elegiën; Gedichtjes voor Kinderen; Het Klaverblad;* and *Nieuwe Kindergedichtjes.*

DWALE. See Belladonna.

DWARF. See Giants and Dwarfs.

DWARFED TREES, growing in flower-pots, are a characteristic ornament of Chinese and Japanese houses and gardens, and the production of them is an art which has been carried to great perfection. It depends on the prevention of an abundant flow of sap, so that whilst the tree is kept living and healthful, vegetation does not go on with its natural activity. The trees are planted in shallow and narrow flower-pots; care is taken that their roots never pass into the ground beneath; they are very sparingly supplied with water; their strongest and leading shoots are pinched off, and their branches are bent and twisted in various ways. A very extraordinary dwarfing is the result of these and other such processes; and the dwarfed trees not unfrequently abound in flowers and fruit.

DWARKA, a maritime t. of the province of Guzerat, in India, stands on the w. side of the peninsula of Kattywar, being in lat. 22° 15′ n., and long. 69° 1′ east. It is one of the most sacred places in this part of Hindustan. On an eminence overhanging the sea-shore, which was once an islet, stands a great temple of Krishna, presenting to the mariner a conspicuous landmark; while, connected therewith by a colonnade, is a smaller edifice dedicated to Deoki, the mother of Krishna. The Gumti, a bordering rivulet which barely reaches the ankle, is, notwithstanding its insignificance, an object of profound veneration.

DWIGHT, Edmund, 1780–1849; b. Mass.; graduated at Yale, and studied law. He was the founder of a firm in Boston which, by establishing great cotton mills, did much toward building up the manufacturing villages of Holyoke and Chicopee. He was

also a leading promoter of normal schools in the state, to the establishment of which he gave a large sum of money.

DWIGHT, HARRISON GRAY OTIS, D.D., 1803–62; b. Mass.; graduated at Hamilton college in 1825; and at once went out under the direction of the American board to assist in the Armenian mission in Turkey, taking a position in Constantinople, where he soon became noted as one of the most zealous and successful workers in the Armenian field. While on a visit to the United States he was killed in an accident on the Troy and Bennington railroad. Among his works are *Researches of Smith and Dwight in Armenia; Memoirs of Mrs. Elizabeth B. Dwight; Christianity Revived in the East;* and a *Catalogue of Literature in Armenia.*

DWIGHT, JOHN SULLIVAN, b. Boston, 1813; graduated at Harvard, and became a Unitarian minister, in which office he continued about six years. He was one of the Brook Farm experimenters, holding on to the last. Having an excellent musical education, he was engaged by the New York *Tribune* to write a series of criticisms of Jenny Lind's performances, which were the first musical criticisms of any consequence that ever appeared in an American daily journal. Soon after the departure of the songstress he established (in 1852) in Boston *Dwight's Journal of Music*, of which he is still the editor.

DWIGHT, NATHANIEL, 1770–1831; a brother of Timothy of Yale. He issued the first geography for common schools published in the United States. Among other works by him are *A Compendious History of the Signers of the Declaration of Independence,* and *The Great Question Answered.*

DWIGHT, SERENO EDWARDS, D.D., 1786–1850; a graduate of Yale; at first a lawyer. In 1817, after studying divinity, he became pastor of Park street church, Boston. From 1833 to 1836, he was president of Hamilton college. Among his works are *Life of Jonathan Edwards* (his great-grandfather, whose works he edited), and *The Hebrew Wife.*

DWIGHT, THEODORE, 1764–1846; b. Northampton, Mass.; a lawyer and journalist. His mother was a daughter of Jonathan Edwards. In politics, he was an extreme federalist, and officiated as secretary in the Hartford convention. He was a brilliant writer and speaker, and was in congress, 1806–7. He edited the *Mirror*, Hartford, Conn.; then the *Albany Daily Advertiser;* and started the New York *Daily Advertiser* in 1817, and was its principal editor for eighteen years. His works were *Life and Character of Thomas Jefferson,* and *History of the Hartford Convention.*

DWIGHT, THEODORE, 1796–1866; son of the secretary of the Hartford convention; graduated at Yale, 1814; and turned his attention to authorship. Among his works are *Tour in Italy; Life of Garibaldi; School Dictionary of Roots and Derivatives; Northern Traveler; Tour in New England; Father's Book; First Lessons in Modern Greek; The Roman Republic of* 1849; and *The Kansas War.*

DWIGHT, THEODORE WILLIAM, LL.D., b. N. Y., 1822; graduated at Hamilton college; afterwards studied law, and was professor of that science in Hamilton college, where he started a school of law. In 1858, he became professor of law in Columbia college, New York. He has published several works on legal themes, among which are *Trial by Impeachment; Argument in the Rose Will and Charity Cases;* besides papers in the *American Law Register*, of which he was assistant editor. In 1868, he became non-resident professor of constitutional law in Cornell university, and, in 1869, lecturer in Amherst college. He has been member of the N. Y. state constitutional convention in 1867; president of the N. Y. prison association; and was one of the committee of seventy chosen by the people, without regard to parties, to bring about reforms and economy in the local government of New York city.

DWIGHT, DR. TIMOTHY, a well-known American theologian, was b. at Northampton, in Massachusetts, May 14, 1752; studied at Yale college, New Haven; and was licensed to preach in 1777. During the war of independence, he was for some time a chaplain in the American army. In 1783, he was ordained minister of Greenfield, in Connecticut, where he also conducted an academy for 12 years with distinguished success. In 1787, the college of Princeton, N. J., conferred on him the degree of D.D.; and in 1795, he was elected president of Yale college and professor of divinity. He died Jan. 11, 1817. D.'s principal work is his *Theology Explained and Defended in a Series of* 173 *Sermons* (5 vols., Middletown, Conn., 1818, etc.). It has been frequently reprinted in England; and used to be—as probably it still is in quiet country quarters—very popular among elderly persons of a serious turn of mind. D. was not a great or original thinker; but his mind was fertile in the production of respectable ideas, which, though sufficiently commonplace, were yet pleasing both in themselves, and from the important nature of the subjects to which they referred. Among his other writings may be mentioned, *The Conquest of Canaan, an Epic Poem* (1785); *Travels in New England and New York* (1821), reckoned by Southey the most important of his writings; and two volumes of *Sermons* (Edin. 1828).

DWIGHT, WILLIAM THEODORE, D.D., 1795–1865; b. Conn.; graduated at Yale, 1813; admitted to the Philadelphia bar, 1821. About 1830, he turned his attention to

theology, studied for the Congregational ministry, and (two years afterwards) became pastor of the Third church, Portland, Me. He published a memoir of his brother, Sereno Edwards Dwight, and a number of reviews and addresses. He was a man of commanding influence as a thinker, writer, and preacher.

DWI'NA, NORTHERN—as distinguished from the Western Dwina or Düna (q.v.)—an important river of Russia, has its origin in the confluence of the Suchona and the Jug, two streams, the latter more than 200 m., and the former nearly 300 m. in length, rising in the s. of the province of Vologda, and uniting in lat. 60° 45′ n., long. 46° 30′ east. The D., from the union of these streams, flows n. for about 50 m., and receives the Vytchegda from the e., a river 500 m. long. At this point, the D. becomes navigable, and here it alters its direction, and proceeds n.w. toward the gulf of Archangel, into which it flows, having been joined on the right by the Pinega, and on the left by the Waga, and having traversed a course of about 700 miles. The basin of the D. comprehends an area of 123,900 sq. miles. Its average width is from 500 to 600 ft.; before debouching into the White sea, however, its surface, which is there marked by many islands, increases in width to about 4 miles. The waters of the D., the largest river that falls into the White sea, are abundantly supplied with fish. Vessels of more than 14 ft. draught cannot enter the D., on account of the shoals at its mouth.

DYAKS. See BORNEO, *ante.*

DYCE, ALEXANDER, an English literary historian, was b. at Edinburgh, 30th June, 1798. He was educated at the high school of that city, and afterwards at Oxford. After officiating for some time as curate, he settled in London in 1827. His literary reputation is chiefly based on his editions of the older English poets and authors—George Peele, Robert Greene, John Webster, Shirley, Thomas Middleton, John Skelton (an author of the beginning of the 16th c., previously little known), Beaumont and Fletcher, Ford, and Marlow, with biographies of the authors, and instructive notices. He also edited the poems of Shakespeare, Pope, Akenside, and Beattie, for Pickering's Aldine Edition of the Poets. An old play discovered by him, called *Timon,* and which may possibly have first suggested to the great poet the idea of his drama of the same name, was besides published for the Shakespeare society, as well as another entitled *Sir Thomas More.* In conjunction with Collier, Halliwell, and Wright, he founded the Percy society for the publication of old English ballads, plays, and poems. His ability as a commentator on Shakespeare is proved by his *Complete Edition of the Works of Shakespeare; the Text Revised; with Account of the Life, Plays, and Editions of Shakespeare, Notes, etc.* (1858). He died in 1869.

DYCE, WILLIAM, R.A., a distinguished painter, was b. at Aberdeen in 1806. He was educated at the university there, and at the age of 16 took the degree of master of arts. After acquiring the rudiments of his art-education he went to Rome, where he studied for some years. His tendency at first was very strongly, and continued so under certain modifications, towards early Italian, or pre-Raphaelite art, and his productions attracted the marked attention of Overbeck, the head of the modern German school. On his return to this country, he settled in Edinburgh, where, besides painting portraits, he contributed largely to the exhibitions. The first picture he exhibited in Edinburgh was in the Perugino style, and though evincing great power, was at that period, 1829, but little felt or appreciated; his "Puck," however, exhibited at the same time, was very successful, and most of his after-contributions to the exhibitions of the royal Scottish academy, of which he was a member, were deservedly popular, particularly his picture of "Francesca da Rimini," exhibited in 1837. After this he went to London, having been nominated to the head-mastership of the new school of design at Somerset house, an office which he obtained on account of his general acquirements and knowledge of art, and which he held for three years. Soon after this he was appointed professor of painting in the London university. He distinguished himself at the Westminster competition by his frescos, and in consequence was one of the artists selected to decorate the palace of Westminster and the house of lords, and at Osborne house several works in fresco have been executed by him. D. was elected an associate of the royal academy in 1844, and academician in 1848. The following are some of the works he exhibited in the royal academy: "King Joash Shooting the Arrow of Deliverance;" a "Madonna and Child" (1846); a "Meeting of Jacob and Rachel" (1850; "Christabel" (1855); "The Good Shepherd" (1856); "Titian Preparing to make his Essay in Coloring;" "Neptune Assigning to Britannia the Empire of the Sea;" a study for a fresco at Osborne (1857); "St. John Leading Home his Adopted Mother;" "The Man of Sorrows" (1860); and "George Herbert at Bemerton" (1861). He died in 1864.

DYCK, Sir ANTHONY VAN. The history of this celebrated painter is of great interest, not only from the high position he held as an artist, but from his having settled in England, where he executed numerous works, which enable us to realize most of the personages whose actions form prominent points in the history of this country. He was b. at Antwerp, 22d Mar., 1599. His father, according to Houbraken, was a glass-painter; and it is said that his talent was fostered by his mother, who painted landscapes, and was skillful in embroidery. After making very considerable progress under Van Balen, he was, in 1615, admitted as a pupil of Rubens, who was not slow to

appreciate his great talents. In a letter, dated 17th July, 1620, addressed to the earl of Arundel, known historically for his patronage of art, the writer states, "Van Dyck lives with Rubens, and his works are beginning to be esteemed little less than those of his master. He is a young man of one-and-twenty, whose parents are persons of considerable property, and it will be difficult, therefore, to induce him to remove." Soon after this—namely, in 1621—by advice of Rubens, he visited Italy. The works of the great Venetians were the first to attract his attention. After leaving Venice, Genoa was the next city he resided in, then Rome, and he went a second time to Genoa, from whence he made a short visit to Palermo. Van Dyck was five years in Italy, and from the number of portraits painted by him in Genoa—many of the best of his works in his Italian manner are still there—he must have lived a considerable portion of the time in that city. On his return to Antwerp, in 1626, he executed various pictures for churches, and the portraits classed among those painted in his Flemish style; the series of cabinet portraits of the painters of his day, engraved by Vostermans, etc., and most of which are now in the possession of the duke of Buccleuch, were also painted at this time. It is stated that, about 1630–31, Van Dyck visited England, and, meeting with no encouragement, remained only a short time; however, there is no satisfactory proof of this. But in 1632, he came to England, by invitation of the earl of Arundel, at the command of Charles I. He was lodged at Blackfriars, was soon afterwards knighted, and had a pension of £200 a year settled on him. His commissions were now numerous, he was enabled to live in great style, entertained people of high rank, and had a country-house at Eltham, in Kent. His wife, Marie Ruthven, by whom he had one daughter, was the daughter of Patrick Ruthven, physician, fifth son of lord Gowrie. Van Dyck died in London in 1641, leaving property to the amount, it is said, of about £20,000. Only 20 years are included within the time when Van Dyck left the studio of Rubens till the period of his death; and during that short career, the number of pictures executed by him, on what is thought to be good authority, seems almost incredible, for in Smith's Catalogue Raisonné of the Works of the Dutch and Flemish Painters, there are descriptions and interesting particulars of upwards of 950. This artist's works may be classed as executed in three distinctly marked styles: 1. Those painted in Italy during his residence of five years, from 1621 till 1626; these are distinguished by deep tone and color, and dignity of character and expression. The portraits of the "Lomellini Family" and an "Italian Nobleman," in the Scottish national gallery, are good examples of his style at this period. 2. His productions between 1626 and 1631, when he lived in Flanders, are known as done in his Flemish style; these works are executed with much *impasto* or body of color in the lights, and transparency in the shadows. Perhaps it was during this period of his career that he executed his finest works, among which the best are the portrait of Snyders the painter, now the property of the earl of Carlisle; the companion-picture of Snyder's wife, now belonging to the earl of Warwick; and the portraits of Philip le Roy and of his wife Mme. le Roy, purchased by the marquis of Hertford at the sale of the king of Holland's pictures. 3. The portraits he painted in England between 1631 and 1641; these are noted for grace and elegance, but many of them were often slight in execution, or done partly by assistants. Van Dyck's biographers and critics generally dwell at great length on his Scripture subjects, and express regret that he devoted so much of his time to portrait-painting; but different notions seem to be now gaining ground. No Scripture subjects by Rubens or Van Dyck, or produced in any of the later schools, will stand comparison, for purity of feeling and appropriate technical execution, with the works of the earlier masters; and the allegorical pieces so much in vogue in the 17th c., are little in accordance with the ideas of the present time. But the portraits by Van Dyck are all interesting and valuable histories, recorded with marvelous truth and vividness, of characters who played important parts in an era noted for great events—and as works of art will rank with the productions of the best schools.

Van Dyck's etchings are admirable. Several of the portraits in the collection of portraits of artists, are etched by him. The impressions of those that were thrown off, when the heads merely were etched, are of great value; indeed, in expression and spirit, they are unequaled. See Carpenter's *Memoir* (1844).

DYEING is the art of staining or coloring yarn or cloth. It has been practiced among eastern nations from time immemorial; and in the sacred writings, we read of the vestments of the high-priest being dyed purple, of linen cloths being dyed blue, purple, and scarlet, and of rams' skins being dyed red. The famous Tyrian purple is believed to have been discovered by an inhabitant of Tyre fifteen hundred years B.C.; and immediately afterwards the Tyrian purple became the badge of royalty, and cloth dyed with it commanded a princely price. The Egyptians, Greeks, and Romans practiced the art of dyeing; and gradually it became more and more wide-spread as civilization advanced, the discovery of America and other lands materially increasing the number of dye-stuffs. In earlier times, dyeing was much more extensively followed as a domestic art than it is at the present time. In the Highlands of Scotland, however, females are still in the habit of dyeing cloth *brown* by immersing it in a solution of copperas (sulphate of iron), and then treating it with a decoction of sumach, logwood, and crottel (*parmelia omphalodes*), a lichen which covers many rocks and trees in moist situations; *black*, by immers-

ing the cloth or yarn in an infusion of the bark of the alder-tree (*alnus glutinosa*), along with copperas and a little sumach; *yellow*, by the common heather (*calluna vulgaris*) and alum; *red*, by the roots of bed-straw (*galium verum*) and alum, etc.

The dye-stuffs (q.v.) employed in the various processes of dyeing are numerous, and when two or more are associated together, many different shades and colors are produced besides the original color yielded by each. The dyeing materials are procured from the mineral, vegetable, and animal kingdoms, and are often very costly. The arrangements connected with dyeing operations are at times simple, whilst at other times they are complex, and require the greatest care and skill on the part of the dyer. In communicating the deep indigo blue to woolen cloth and yarn, a vat is taken, about 6 or 7 ft. in diameter, and 8 to 9 ft. in depth, and nearly filled with water, along with 18 to 22 lbs. of indigo, 10 to 20 lbs. of madder, 7 to 9 lbs. of bran, and generally 7 to 9 lbs. of woad. After the requisite boiling, and the addition of 7 or 8 lbs. of lime, to form an alkaline liquid in which the indigo can be held in solution, the whole is well closed over with tightly fitting wooden covers; and in a day, the putrid fermentation of the woad and bran proceeds, the result of which is to abstract the oxygen from the blue indigo, the color of which is gradually reduced till it assumes a yellowish color, and the solution then contains indigo white. If woolen yarn or cloth is now dipped in this liquid, it comes out of a yellow tint, from the attachment of the white indigo solution; but when exposed to the air, the oxygen immediately begins to act upon the white indigo, combining with it, so as to form oxidized or blue indigo, and as the process of oxidation proceeds, the yarn or cloth becomes first of a greenish and then of a blue color. If the cloth be again soaked in the yellowish solution, and subsequently exposed to the air, the depth of the blue color may be increased step by step, till it arrives at that deep shade of blue so well known, especially in the coarser qualities of woolen cloth. In the dyeing of cotton with indigo, the vat is prepared differently. The indigo is first ground into a thin paste with water, and afterwards placed in a vat with protosulphate of iron and milk of lime. The lime (CaO) takes the sulphuric acid (SO_3) from the sulphate of iron ($FeOSO_3$), forming sulphate of lime ($CaOSO_3$), and liberating protoxide of iron (FeO), which immediately abstracts the oxygen from the blue indigo, reducing it to white indigo, and the latter dissolves in the excess of lime present in the vat, yielding a colorless solution. When cotton cloth or yarn is dipped in this, it comes out of the vat almost colorless; but on exposure to the air, the indigo becomes reoxidized, and the cloth passes to a green, and ultimately to a deep-blue shade. The cloth or yarn is then washed in water, and afterwards soaked in very dilute sulphuric acid, to which remove any oxide of iron remaining attached, and rewashed in water, when the blue color becomes more bright and clear.

In the fixation of color upon cloth, recourse is often had to a mordant (see CALICO-PRINTING), which acts as a middle agent, and attaches the color to the cloth. The principal mordants are alum, cream of tartar, and salts of tin. Previous to the application of any color, the cloth or yarn must be well cleansed from grease, oil, etc., by scouring in soda or in soap, and except where the material is to be dyed of a dark color, the goods are also subjected to the process of bleaching. In the case of fabrics which require a smooth surface, the preliminary operation of singeing off the loose hairs is resorted to (see CALICO-PRINTING).

DYEING OF COTTON.—The following receipts for the dyeing of cotton apply to 10 lbs. weight of cotton yarn or cloth, which is found to be the smallest quantity capable of being well-dyed at one time. The proportions of each ingredient may be altered, however, so as to correspond with the quantity of cloth or yarn to be operated upon.

1. *Common Black.*—Take 3 lbs. sumach, and treat with hot water; steep the goods in the hot decoction for some hours; wring out; wash for 10 minutes in lime-water, and for 30 minutes in a solution of 2 lbs. copperas. Wash the goods well in cold water, sometimes repeating the treatment with lime, and rewashing; then work the goods for 30 minutes in a warm solution of 3 lbs. of logwood, and afterwards with 2 ozs. copperas; work again for 10 minutes; wash and dry.

2. *Jet Black.*—Proceed as at 1, adding 1 lb. of fustic with the logwood; and when 3 pints of iron liquor are used instead of the 2 ozs. of copperas, a more brilliant black is obtained.

3. *Blue Black.*—Use the indigo blue vat, and then proceed as at 1.

4. *Brown.*—Treat the goods with a yellow dye; then work for 30 minutes in a decoction of 2 lbs. lima wood and 8 ozs. logwood; lift and work with 2 ozs. alum for 15 minutes; then wash and dry.

5. *Catechu Brown.*—Immerse the goods at a boiling temperature in a decoction of catechu; then work for 30 minutes in a hot solution of 6 ozs. bichromate of potash. Wash in hot water, and if the latter contain a little soap, the color will be improved.

6. *Chocolate or French Brown.*—Dye the goods with a spirit yellow; then treat for half an hour with a solution of 3 lbs. of logwood; raise with a little red liquor; work for 10 minutes; wash, and dry.

7. *Red.*—Make a hot solution of 3 lbs. of sumach; introduce the goods, and let stand till the liquor is cold; then wring out, and work in water containing in each gallon a gill of red spirits (prepared by adding 2 oz. of feathered tin by degrees to a mixture of three parts of hydrochloride acid, one part of nitric acid, and one of water in

the cold) for 30 minutes; wring and wash well; then work the goods for 30 minutes in a lukewarm decoction of 3 lbs. of lima-wood and 1 lb. of fustic; add a gill of red spirits; work the goods longer; wash, and dry. The famous Turkey-red is imparted to the cloth by first impregnating it with an oily or fatty substance, and then subjecting it to a decoction of madder. It is one of the most durable of all colors.

8. *Yellow or Straw.*—Work the goods in a weak solution of acetate of lead; then wring out, and work in a dilute solution of bichromate of potash; wring out, and work again in the lead solution; wash, and dry.

9. *Leghorn Yellow.*—Proceed as at 8, but add a little annotto liquor with the solution of bichromate of potash

10. *Spirit Yellow.*—Work the goods through a weak solution of protochloride of tin for 30 minutes; then work in a solution of quercitron bark for 15 minutes; lift out, and work again in tin solution, and wash in cold water.

11. *Orange.*—Proceed as at 8, and afterwards pass through lime-water at the boiling point, ultimately washing in cold water.

12. *Blue.*—The goods are worked in various strengths of solutions of salts of iron, such as nitrate of iron; wring out; wash in water, and then work in solution of yellow prussiate of potash; wring out, and wash in water containing a little alum. The various shades of blue may be obtained by using stronger or weaker solutions.

13. *Green.*—Dye the cloth blue; then work in red liquor (acetate of alumina); wash in water; work in decoction of fustic or bark; raise with solution of alum; wash in cold water, and dry. The darker shades of green, as olive or bottle green, are brought out by the use of sumach and logwood along with the fustic.

14. *Puce or Lilac.*—Work the cloth or yarn in red spirits (see 7), then in logwood solution at a temperature of 140° F., adding a little red spirits, red liquor, or alum; wash, and dry; or dye the cloth blue (12); then work in solution of logwood; add alum; work again; wash, and dry.

15. *Purple.*—Soak the goods in a warm decoction of sumach till cold; work for an hour in red spirits; wash; work in hot solution of logwood; then add a little red spirits, and work again; wash, and dry. The various shades of purple may be obtained by altering the strength of the chemicals; the more sumach, the browner the hue, and the more logwood, the bluer the purple becomes.

16. *Lavender or Peach.*—Work the goods for 20 minutes in spirit-plumb (a strong solution of logwood, treated with about one sixth of its volume of a solution of tin, made by dissolving tin in six or seven parts of hydrochloric acid, one part of nitric acid, and one of water); wring out, and wash well in cold water.

17. *Safflower Lavender* is obtained by dyeing the goods a light-blue, then working in decoction of safflower, which places a pink on the top of the blue.

18. *Drab.*—Work the goods in a decoction of sumac; lift, add copperas; rework; wash in water; then work in a mixed decoction of fustic, lima wood, and logwood; raise with a little alum; wash, and dry. Catechu is occasionally employed.

Dyeing of Wool.—In the dyeing of woolen yarn and cloth, the various steeps are used warm, but the washings in water are done cold. Care must be taken to remove every particle of grease from the wool by washing with soda and soap, before it is subjected to the process of dyeing, else the coloring matters will not adhere. The more common and important colors are obtained as follows:

19. *Black*—by working the cloth in a bath of camwood, then of copperas; after which wash out; then treat with decoction of logwood and copperas: or work in a bath of bichromate of potash, alum, and fustic; lift, and expose to the air; then immerse in decoction of logwood, barwood, and fustic; thereafter of copperas.

20. *Brown.*—The goods are worked in a bath of fustic, madder, peachwood, and logwood; then introduce into dilute solution of copperas: or the goods are treated with a bath of bichromate of potash, argol, and alum, washed, and then introduced into a bath of fustic, madder, peachwood, and logwood.

21. *Red*—by working in a decoction of bichromate of potash and alum, and subsequently in a bath of peach or lima wood, with a little alum. Scarlet is obtained from cream of tartar, cochineal, sumach, and fustic.

22. *Crimson*—from cochineal, cream of tartar, and chloride of tin. Cudbear gives a wine tint.

23. *Pink.*—Work the goods in a bath of tartar, alum, cochineal, and red spirits.

24. *Orange*—from a bath of sumach, cochineal, fustic, tartar, and red spirits.

25. *Yellow*—from a bath of tartar and alum; then a decoction of bark, sumach, fustic, and red spirits.

26. *Blue.*—Various shades may be obtained from immersion in salts of iron, and then in solutions of yellow prussiate of potash (see 12). Also work the wool in a bath of argol, alum, and indigo extract.

27. *Green.*—Work the goods in a bath of fustic, argol, and alum, and thereafter in a solution of indigo. The dark shades of green, such as olive, are brought out by a bath of fustic, logwood, madder, and peachwood, and afterwards of copperas.

28. *Violet*—from cudbear, logwood, barwood, or camwood, and peachwood; as also alum. The addition of copperas brings out a puce tint.

29. *Drab.*—The manifold shades of this color are procured from variable strengths

of decoctions of madder, peachwood, logwood, fustic, associated with alum and copperas.

DYEING OF SILKS.—The operations connected with the dyeing of silk are similar to those already sketched out, but a more thorough scouring of the raw material requires to be made, so as to remove all the gum and wax belonging naturally to the fiber.

30. *Black* is obtained by working the silken material in copperas (sulphate of iron), then in logwood containing some chamber liquid, and repeating the treatment with copperas and logwood till the requisite shade is procured. A little nitrate of iron tends to give a more full, deep black; and alum and white soap are also used with advantage. Acetate of copper is occasionally used.

31. *Blue-Black.*—Dye a blue as at 12, and then proceed as at 30.

32. *Brown.*—Obtain an orange by immersion in a solution of annotto, then treat with copperas; and introduce into a bath of fustic, logwood, archil, and a little alum. If a more yellow tint is required, add more fustic; redness is obtained by adding peachwood, and blueness by the addition of logwood.

33. *Reds* are obtained from peachwood and fustic, and thereafter red spirits. Annotto is used in getting up the scarlet shades, and cochineal and safflower in the more expensive red dyes. Rubies and maroons require cudbear.

34. *Pink*—from safflower, associated with sulphuric acid and cream of tartar.

35. *Orange and Yellow*—by treating the goods with more or less strong solutions of annotto, associated with alum and white soap.

36. *Blue*—from salts of iron and yellow prussiate of potash; or from solutions of sulphate of indigo, assisted with a little alum.

37. *Green*—from steeping in decoctions of fustic and sulphate of indigo, along with a little alum. The darker shades have copperas added and logwood.

38. *French and Pearl White.*—Work the silk in a lather of white soap, to which archil or cudbear has been added, to give the required shade.

39. *Drab*—from decoctions of sumach, fustic, logwood, and more or less copperas, according to the depth of shade required.

DYEING OF MIXED FABRICS.—The coloration of textile fabrics composed of more than one kind of material, generally requires two or more processes, as the plan pursued in dyeing wool is seldom capable of fixing the color upon cotton. The customary plan followed is to immerse the fabric in the requisite baths, to dye the wool, and then to treat the partially dyed material in the manner found suitable for cotton. Occasionally, the woolen thread of the cloth is dyed of one color, and thereafter the cotton is treated so as to acquire a different shade or color. The producing of a colored pattern on cloth has already been considered under CALICO-PRINTING.

DYER, a co. in w. Tennessee, on the Mississippi; 606 sq.m.; pop. '70, 13,706. Soil rich, surface level, with extensive forests of white oak, walnut, poplar, etc. Corn, cotton, lumber, and tobacco are the chief products. Co. seat, Dyersburg.

DYER, ALEXANDER B., 1817–74; b. Va.; graduate at West Point, 1837. In 1864, he was appointed chief of ordnance with the rank of brig.gen. He served in the Florida war in 1837–38; in various arsenals, 1838–46; in the war with Mexico, 1846–48; in various arsenals, 1848–61; and in the ordnance board, 1859. He had charge of the Springfield armory, 1861–64, and served in the ordnance board, 1860–63, and as chief of ordnance in the ordnance bureau in Washington, from 1865 to his death.

DYER, GEORGE, an antiquary and scholar of some eminence, was b. in London, Mar. 15, 1755, and was educated first at Christ's hospital, and afterwards at Emanuel college, Cambridge, which he entered in 1774, and where, after four years' study, he took his degree of B.A. During the next 14 years, he was variously engaged, chiefly at Cambridge, as usher, tutor, and as minister (in the Baptist denomination), but he finally settled in London in 1792. Here he devoted himself principally to literature, and produced, among many works of less note, the *History of the University and Colleges of Cambridge* (Lond., 2 vols., 1814), and *Privileges of the University of Cambridge* (Lond., 2 vols., 1824). He also contributed largely to magazines. He died in London in 1841. D. was a man of remarkable straightforwardness and honesty of character, qualities which are everywhere discernible in his works. He was also a poet, although now forgotten, and never famous.

DYER, Rev. JOHN, an English poet, was b. at Aberglasney, in Caermarthenshire, in the year 1700, and educated at Westminster school. He was intended for the law, but, however, abandoned that study for painting. In 1727, he published his poem of *Grongar Hill,* remarkable for simplicity, warmth of feeling, and exquisite descriptions of nature. He then made the tour of Italy, and returning home in bad health, took orders, and obtained some respectable ecclesiactical preferment. In his didactic poem, entitled *The Fleece* (1754), the difficult subject is treated with great success; but the unpretending tone of the poem made no impression upon his contemporaries. Another poem, *The Ruins of Rome* (1740), abounds in isolated beauties. D. died in 1758. A collected edition of his poems appeared in 1761.

DYER, MARY, one of the victims of the persecution that befell the Quakers in the early years of the Massachusetts colony. Their uncompromising attack on the organiza-

tion of both the church and the civil state, led to the enactment by the legislature of a law of banishment against them under penalty of death if they should return. Mary Dyer left the colony for a time, but soon returned, when she was arrested and convicted, but on being led forth to execution was reprieved, and, against her will, conveyed out of the colony. Returning again, she was hanged on Boston common, June 1, 1660.

DYERS' BROOM, or WOADWAXEN (*genista tinctoria*), a leguminous shrub of European origin bearing yellow flowers and simple leaves, and said to be the bush genêt, from which the Plantagenet family took its name. It is used in Russia for preventing hydrophobia; and formerly in this country its tops were domestically used for a yellow dye, and it was extensively cultivated in New England. Its medicinal value appears to be small.

DYERS' WEED, or ROCKET (*reseda luteola*), a European herb, naturalized in the region of New York, resembling the mignonette. It was formerly used for medicinal purposes, but is now valued chiefly as material for a yellow dye, for which purpose it is largely cultivated in some parts of Europe.

DYE-STUFFS. The substances used in dyeing as the sources of coloring matter, are derived from the animal, mineral, and vegetable kingdoms, the greatest number from the last mentioned. To the animal kingdom, and to the class of insects, we are indebted for *cochineal*—and consequently for *carmine—kermes*, and *lac*, and less directly for *galls*. The *Tyrian purple* of the ancients is also said to have been a product of the animal kingdom, obtained from a mollusk.—The dye-stuffs obtained from the vegetable kingdom are numerous, and in every part of the world there are some in domestic use, which have not become articles of commerce. Such are those dye-stuffs of the Highlands of Scotland, mentioned in the article DYEING. Dye-stuffs are procured from plants of widely different natural families: there are some indeed in which certain coloring matters appear to be extensively prevalent, as in *rubiaceæ* (madder, etc.), and the genus *cæsalpinia* (q.v.). They are also obtained from almost all different parts of plants, as the heart-wood (*duramen*) of the stem (logwood, Brazil-wood, camwood, fustic, etc.); the bark (alder, etc.); the root or its bark (barberry root, etc.); the leaves and other herbaceous parts (indigo, etc.); the corolla (safflower); the fruit (French berries, annotto, etc.). The principal dye-stuffs are the following: *Alkanet* (q.v.), useful in dyeing various shades of lilac, lavender, and violet, which are, however, liable to fade on exposure to light. *Aloes*, obtained by evaporating the juice of the aloe, which is grown in the East and West Indies, Sicily, Italy, and Malta. It contains a brown coloring matter named *aloetin*, which may be employed in the production of a brown tint. *Arnotto* (q.v.), employed in imparting the various shades of yellow, orange, and scarlet, to silk, wool, and cotton. *Archil*, yielding, when infused in water, a crimson dye of great beauty, though fugitive, and used in giving a finish to wool and silk which have been previously dyed. *Barberry root*, imported from the East Indies, and containing a yellow coloring matter called *berberin*. *Brazil-wood*, often called *peach-wood*, containing *brazilin*, which, in contact with the air, yields a rich red color. *Camwood* (q.v.), or *barwood*, has a red color similar to that of Brazil-wood, is generally employed in the form of a coarse powder, and readily imparts its color to water. *Catechu* yields a reddish-brown solution in water, and performs an important office in the dyeing of many shades of brown, black, and green. *Chica* (q.v.), employed in the dyeing of wool and cotton of an orange-yellow color. *Cochineal*, employed directly, or indirectly in the form of carmine (extracted from the cochineal), in imparting the most beautiful red and crimson colors. *French, Persian, Turkey*, or *Spanish berries*, obtained from several species of *rhamnus* (see BUCKTHORN), yield a powerful yellow dye. *Fustet*, the finely divided wood of *rhus cotinus* (see SUMACH), a yellow dye. *Fustic* or *yellow wood*, used for dyeing cloth yellow, and for communicating a good green tint to cloth already rendered blue; as also, in conjunction with other dyes, in imparting various shades of drabs, olives, fawns, etc. *Galls* or *gall-nuts* are employed in dyeing cloth of a dark or black color. *Indigo* (q.v.), very extensively used in the dyeing of yarn and cloth of a deep blue color, which may be afterwards rendered green by a yellow dye. *Kermes, kermes grains*, or *alkermes*, an excellent material for dyeing many shades of red, and one of the most ancient dye-stuffs employed in the coloring of silk. *Lac* (q.v.), *shell-lac*, or *stick-lac*, is used in the preparation of red dyes. *Logwood* (q.v.), broken up into small chips, or reduced to powder, is employed in the dyeing of reds, and, when associated with other substances, yields purples, violets, and blues. *Madder* (q.v.), one of the most important of dye-stuffs, is extensively used in the dyeing of cloth and yarn red, purple, brown, etc. *Munjeet* or *Indian madder* is used in India instead of madder. *Quercitron* yields a rich orange-yellow, or yellow-red dye, capable of being afterwards made a brown; and when used after a blue dye, it changes the latter to a bright green. *Safflower* yields a rich yellow dye. *Sandal-wood, santal* or *Saunders wood*, yields a red color, which, along with other substances, may be altered to violet, reddish-brown, and scarlet. *Sumach*, occasionally called *young fustic*, is employed as a yellow dye, and also for the tannin and gallic acid it contains, which enables decoctions of sumach to be used with great effect for imparting depth or solidity to other colors. *Turmeric*, or *Indian saffron*, is employed as a yellow dye, but is very fugitive. *Weld*, or *wold*, produces a rich but fugitive yellow. *Woad* is employed as a blue dye for woolen and silk yarn and cloth, either with or without indigo. *Wongshy*

is a new yellow dye-stuff procured from the seed-vessels of a plant belonging to the family of *gentianæ*, and imported from Batavia.

The above list of dye-stuffs comprehends those which are obtained, directly or indirectly, from the vegetable and animal kingdoms; and a more lengthened notice of the substances will be found under their respective names. Other dye-stuffs less generally used are also noticed in the articles devoted to different orders and genera of plants. The metallic salts and compounds employed in dyeing will be specially noticed under the various metals; thus, for acetate of lead, see LEAD; sulphate of iron, see IRON; etc.

COAL-TAR COLORS.—The most recent discovery of importance in dyeing, is the extraction of colored substances of great beauty from coal-tar, and the application of these to the coloring of cloth. At the present time, these dyes of coal-tar origin are most extensively employed, and give rise to the fashionable colors named aniline purple, Tyrian purple or mauve, violine, roseine, fuchsine or magenta, solferina, bleu de Paris, aniline green or emeraldine, azuline, etc. It is only, however, within the last 20 years that these dyes have become practically known, though the preliminary discoveries in connection with their extraction were made in 1826. The condensable product or gas liquor obtained during the destructive distillation of coal in gas-works, consists of aqueous matter holding salts of ammonia in solution, and tar with naphtha. The tar consists of a numerous class of bodies, of which aniline and benzole are two. The aniline is present in minute quantity; and for manufacturing purposes, means are generally resorted to for the conversion of the benzole of gas-tar into aniline. The process followed on the commercial scale is to act upon the benzole by nitric acid, by which it is converted into nitro-benzole, and therefore, by the action of acetate of the protoxide of iron, it becomes aniline.

Aniline Purple.—In the preparation of the dye known as aniline purple, solutions of equal equivalents of sulphate of aniline and bichromate of potash are mixed together; and when the reaction is complete, a black precipitate is obtained, which is dried, and then digested several times in coal-tar naphtha, to separate all resinous matter. The residue is dissolved by successive quantities of alcohol; to the solution being placed in a retort, the alcohol is distilled off, and the aniline purple is left as a beautiful bronze-colored substance. Aniline purple is slightly soluble in cold water, more so in hot water, and is readily dissolved by the alcohols and aniline itself. It is nearly insoluble in ether and naphtha.

Roseine is most readily prepared on the commercial scale by adding two equivalents of binoxide of lead to a boiling solution of one equivalent of sulphate of aniline, and boiling the whole for a short time. On filtration, a rose-colored solution is obtained, which is evaporated down to small bulk, when some resin separates, and the roseine is precipitated by soda or potash, and being collected on a filter, can be washed and dried. This dye is readily soluble in alcohol, and yields a very intense crimson color, which, on being evaporated to dryness, leaves a dark metallic-looking and brittle residue of roseine. It is soluble in water, but not in naphtha.

Violine is procured by the oxidation of aniline, and the process generally followed is to heat a mixture of two equivalents of sulphuric acid, one equivalent of aniline, and some water, to the boiling-point, then add binoxide of lead, boil for some time, and filter hot. A purple liquid is obtained, which is boiled with potash till the aniline present is volatilized, and the coloring matter is precipitated, when the latter is thrown on a filter, washed with water, and dissolved in a dilute solution of tartaric acid. On filtration, the colored liquid is evaporated to small bulk, refiltered, reprecipitated by potash and soda, and the precipitate being dissolved in alcohol, yields an alcoholic colored solution, which, on distilling off the alcohol, leaves the violine as a brittle bronze-colored substance. Violine is very slightly soluble in water, is readily dissolved by alcohol, and is insoluble in ether and naphtha.

Fuchsine or *magenta* is prepared by adding anhydrous bichloride of tin by degrees to aniline. The materials are constantly stirred during the operation, to keep down the intensity of the action, and the result is, that much heat is evolved, the mixture becomes pasty, then liquid and brown; and as the temperature approaches the boiling-point, it becomes a dark, almost black liquid, which in very thin layers presents a rich crimson color. This liquid is boiled for some time, much water added, the whole reboiled, so as to volatilize any free aniline, and chloride of sodium (common salt) added till saturation, when the fuchsine or magenta is precipitated as a golden green, semi-solid, pitchy substance. Any resinous matter still remaining may be separated by digestion in benzole. This dye may also be obtained by acting upon aniline with nitrate of mercury. Fuchsine or magenta is sparingly soluble in water, dissolves to some extent in alcohol, and is insoluble in ether and naphtha.

Bleu de Paris is prepared by heating 9 parts by weight of bichloride of tin and 16 parts of aniline to a temperature of about 350° F., in a sealed tube, for 30 hours, when a blue product is obtained, which is soluble in alcohol, and crystallizes therefrom in fine needles of a lively blue color. Bleu de Paris is soluble in water, alcohol, wood-spirit, and acetic acid, and insoluble in ether and bisulphuret of carbon.

Aniline Green or *Emeraldine* is obtained by acting upon a hydrochloric acid solution of aniline by chlorate of potash, when the aniline becomes oxidized, and yields a dull-

green precipitate, which, on drying, becomes an olive-green residue. It is insoluble in water, alcohol, ether, and benzole, and in the presence of a free acid the green color improves in appearance, though it returns to its original shade when the free acid is removed.

Quinoline or *Chinoline* is present in coal-tar, and may be employed to yield three coloring matters—a violet, a blue, and a green; but the processes as yet followed in their preparation belong more to the laboratory experiments of the scientific chemist than to the practical operations of the manufacturer.

Picric Acid is obtained by acting upon many organic substances, such as indigo, aniline, carbolic acid, salicin, silk, aloes, gum-resins, etc., by nitric acid. On the commercial scale, carbolic acid is generally employed, and it is first treated with nitric acid of slightly less density than 1300 (water = 1000), and afterwards boiled with stronger acid, when it passes into picric acid, and is precipitated on dilution with water. It can be purified by recrystallization from boiling water. Pure picric acid crystallizes in lamina of a primrose yellow color.

Azuline is the only other coloring matter of practical importance derived directly or indirectly from coal-tar. It is a brittle, non-crystallizable substance, with a copper-colored metallic appearance. It is sparingly soluble in water, but is soluble in alcohol, yielding a fine blue solution with a shade of red. Treated with concentrated sulphuric acid, it becomes a fine blood-red liquid, which, on dilution with much water, gives a red precipitate of azuline.

Pittacal is a blue coloring matter obtained from coal-tar.

Dyeing of Silk and Wool by the Coal-tar Colors.—This department of the operations of the dyer is very simple, as the silk and wool fibers possess the power of taking up and fixing the majority of these coloring matters with great rapidity, whenever the yarn or textile fabric is placed in the vessel containing a solution of the color. In the dyeing of silk with aniline purple, violine, and roseine, the alcoholic solution of the color is diluted with 8 times its volume of hot water acidulated with tartaric acid, and thereafter treated with a larger quantity of cold water. The silk is merely worked in this comparatively weak solution of the dye till the shade of color is deep enough. The addition of a little sulphate of indig to the dye-vat assists in bringing out a more decided blue tint. The same result is obtained by first dyeing the goods with Prussian blue before immersion in the coal-tar color. When silk is to be dyed with fuchsine, picric acid, chinoline blue or chinoline violet, the goods require only to be worked in water-solutions of these colors. A little acetic acid added to the vat containing the fuchsine or picric acid is advantageous, and if a solution of sulphate of indigo is mixed with the solution of picric acid, the goods acquire a fine green color.

Azuline is attached to silk with more difficulty than any of the preceding colors. The silk requires to be worked first in a solution of azuline acidulated with sulphuric acid, and thereafter the liquid is raised to the boiling-point, and the silk continued to be worked in it. The goods are then washed in water, worked in a bath of soap-lather, rinsed, and finished in a weak acid bath.

Wool is dyed with aniline purple, violine, roseine, fuchsine, and chinoline by merely working the yarn or cloth in a vat containing a water-solution of the coloring matter at a temperature ranging between 112° and 140° F.

Cotton has not the power of firmly attaching, directly, coal-tar colors to its fiber so as to resist the action of soda and of soap. When the cotton, however, is treated with a solution containing much tannin, such as a decoction of sumach, or galls, for an hour or so, then introduced into a dilute solution of alum or stannate of soda, and, lastly, passed into a dilute acid liquid, and washed in water, it acquires a great power of firmly attaching aniline purple, roseine, violine, fuchsine, and chinoline colors, whenever it is worked in a dye-vat containing these coloring matters. This principle of the attachment of these colors to cotton by means of a mordant of tannin and alum, may be applied in printing patterns upon cloth, as in calico-printing (q.v.). The pattern is printed on the cloth by means of tannin and alum dissolved in water, and thickened with gum; and afterwards, when the prepared goods have been introduced into a hot dilute acid solution of the coloring matter, the dye becomes attached to those parts on which only the tannin has been printed, and leaves the other parts uncolored. Another mode is to mix the dye with albumen or lacterine, print on the cloth, and then subject to the action of steam, which coagulates the albumen or lacterine, and at the same time fixes the color on the cloth.

DYING DECLARATION. By the law of all nations, the declaration of a party, made in the immediate prospect of death, relative to the mode of his death, is received as evidence. The ground of this exception to the general rule of law, that hearsay evidence is inadmissible, is thus clearly stated by lord chief baron Eyre: "That they are declarations made in extremity, when the party is at the point of death, and when every hope of this world is gone; when every motive to falsehood is silenced, and the mind is induced, by the most powerful considerations, to speak the truth: a situation so solemn and so awful is considered by the law as creating an obligation equal to that which is imposed by a positive oath in a court of justice." In Scotland, the dying declaration of a witness is admissible even though he is not himself conscious of the danger of death.

In this respect, the law of Scotland differs from that of England and America. The general rule as to dying declarations are, that they cannot be received in any civil case, and in criminal cases only where the death of the deceased is the subject of the charge, and the circumstances of the death are the subject of the dying declaration. They must be made, except in Scotland, with the full knowledge of impending death; they are subject to the ordinary rules of law as to capacity to give evidence; they must relate to facts only, and not opinions, and must be freely made; they must be complete in themselves, and if it appear that the dying man intended to qualify them, they cannot be received. See Taylor on *Evidence*.

DYKE, or DIKE (Dutch, *dyk*), an artificial mound along the bank of a river or seashore, erected for the purpose of preventing inundation. The term is from the same root as *dig*—hence also *ditch*, or the hollow from which the D. is formed. The French employ the term *levée* to signify this species of embankment, of which there is a notable example in the levées erected along the Mississippi near New Orleans. The principle on which dykes or levés are formed is very simple. The embankment must be of sufficient breadth and height to resist the pressure of the water, and must be constructed with that easy slope which will allow the floods to rise without any particular impediment. This is quite understood in practical engineering. Flowing water must not be abruptly resisted, but suffered to rise gradually and expend itself. It is accordingly of the first consequence, in all attempts to restrain water by embanking, that the mounds should possess not only magnitude, but a very gradual rise in the side which has to resist the impact of the flood. For want of attention to this method of embanking, there has often been much ineffectual dyking of the sea and rivers liable to do damage by flooding.

In no country has the erection of dykes been carried to such a length as the Dutch Netherlands. Consisting to a large extent of low meadow-land, formed of materials brought from Switzerland and Germany by the Rhine, there is a constant liability to be deluged by the several branches of that river previous to their entering the sea. Inspired by a sense of their perilous situation, as well as a naturally industrious and painstaking disposition, the Dutch have for ages been distinguished for their ingenious system of river-embanking; till at length the dykes of Holland are spoken of as almost one of the wonders of the world. While the country generally is guarded against sea-inundations by high mounds of sand or dunes, created by the deposit of light sand blown from the level shores (see DUNE), the interior is secured from the rivers by the system of dykes here referred to. These ramparts are in appearance long green mounds, broad at the base, graduated in their slope, and often of sufficient width to admit of a canal or road, or both, being formed along the top. To give strength to the fabric, willows are planted and also interwoven like wicker-work on the sides. Carried along the banks of rivers, and in some places along the margin of the sea, as well as crosswise in different parts of Holland, a singular network of embanking is presented, which answers the double purpose of a protection from inundation and a means of having canals, by which superfluous water pumped from the meadows, or *polders*, may be run off into the sea. The whole system of dyking is placed under local and general superintendence, at a considerable cost to the public. One of the most gigantic of these dykes is that along the Helder; it measures about 6 m. in length, 40 ft. broad at the summit, along which there is a good road, and descends into the sea by a slope of 200 ft., inclined about 40 degrees. Notwithstanding the precautions taken, one or other of the lower branches of the Rhine occasionally overflows its banks and lays a wide district of country under water. One of these inundations took place in the winter of 1860–61, and, committing immense havoc, was the cause of much loss and suffering. A good example of dyking for the purpose of drainage is shown near Haarlem, where it has facilitated the withdrawal of the Haarlem lake (q.v.).

DYKES. In volcanic districts, rents frequently occur which are filled with molten materials from below, that subsequently solidify, and form solid walls, filling the fissures, and separating the edges of the disjointed strata. To these walls, geologists apply the term dyke, a Scottish word for a wall or fence. Similar walls of intruded matter occur in stratified rocks of all ages, and have been connected with volcanic eruptions belonging perhaps to every geological epoch. They consist of similar materials to whatever period they belong—viz., lava, either in a granular, compact, or glassy condition. The D. connected with Vesuvius have been minutely described. Those in the great escarpment which Somma presents to the modern crater of Vesuvius permit of a careful examination. They are chiefly vertical, and traverse at right angles the beds of lava, scoriæ, breccia, and sand which form the ancient cone. They project in relief several inches, or sometimes feet, from the face of the cliff, being extremely compact, and less destructible than the intersected tuffs and porous lavas. In vertical extent they vary from a few yards to 500 ft., and breadth from 1 to 12 feet. Many of them cut all the inclined beds in the escarpment from top to bottom, others stop short before they ascend above half-way, and a few terminate at both ends, either in a point or abruptly. In mineral composition, they scarcely differ from the lavas of Somma. Their texture is different at the edges and in the middle; towards the center, the rock is larger grained, while at the edge it is always finer grained, sometimes vitreous. This evidently arises

from the rate of cooling, it being known that molten trap or lava, when suddenly cooled, assumes a vitreous structure, while a slow cooling, as it permits the mass to remain in a condition fitted for the operation of the crystalline force, and the segregation of the separate materials, produces a more or less granular structure, in proportion to the time occupied in cooling. The rock forming the D. is far more compact than that of ordinary lava, for the pressure of a column of melted matter in a fissure greatly exceeds that in an ordinary stream of lava; and pressure checks the expansion of those gases which form vesicles in lava. When the fissures have been openings for the egress of molten matter, the surfaces have been worn and smoothed by the current, the intense heat having melted all projections and obstructions to the passage of the incandescent fluid.

The appearances of ancient trap-dykes are very similar to those of recent volcanic dykes. Trap-dykes generally are prominent objects in the landscape, because, while the softer rocks through which they have intruded have been abraded by the sea, rivers, or rain, they, being more compact, stand out prominently in the face of precipices or on the level surface of a country. Sometimes, however, from chemical action, and chiefly from the oxidation of the iron which all trap-rocks contain to a greater or less extent, the intruded dyke decomposes more rapidly than the containing rock. It then for some feet or yards leaves the original fissure again unoccupied. A singular modification of this arrangement may sometimes be noticed, when the intrude digneous rock has so indurated the beds through which it passed as to make them less liable to weather than the unaltered portions of the beds, or than even the dyke itself. In such cases, we find two parallel walls of indurated strata rising above the general level of the country, and forming the banks of a ditch produced by the disappearance of so much of the dyke. All these appearances may be observed in the island of Arran, a locality unsurpassed for observing those remarkable geological phenomena. Some D. have had no apparent influence on the adjoining strata, even when these consist of materials most liable to be affected by heat. Thus, seams of coal sometimes remain unaltered, though in contact with the supposed injected molten matter. Considerable doubt is thus cast upon the generally received opinion, that in all cases D. were intrusions of lava. The effects that have been produced in numerous instances can, however, only be accounted for by supposing that the adjacent rocks have been affected by heat. The writer has observed in Arran, at a place where a dyke cut at right angles an older one, that the edges of the older dyke which had been acted upon by the current of liquid lava, were converted into true obsidian to the depth of nearly half an inch. In Anglesea, shale at the edge of a dyke 134 ft. wide has been converted into hard porcellanous jasper; and argillaceous limestone loses its earthy texture, and becomes granular and crystalline. The chalk, in Antrim, is converted, by basaltic D., into granular marble. Coal, as might have been expected, is often altered in an extraordinary degree. Witham describes the effects of the Cockfield Fell dyke on a seam of coal through which it passes. It is a nearly vertical wall of trap, 18 or 20 yds. thick, and is traceable to a distance of 70 m., running in a s.e. direction. The coal is about 6 or 8 ft. thick, and is affected about 50 yds. from the dyke. It first loses the calcareous spar, which occurs in the joints and faces, begins to look dull, and loses its quality for burning. As it comes nearer, it assumes the appearance of a half-burnt cinder; and approaching still nearer the dyke, it grows less and less in thickness, becoming a pretty hard cinder only two feet and a half in thickness. Eight yards further, it is converted into real cinder; and more immediately in contact with the dyke, it becomes a black substance resembling soot caked together, the seam being reduced to 9 in. in thickness. The coal thus deteriorated is 25 yds. of bad short coal, half reduced to cinder; 16 yds. of cinder; and 10 of sooty substance.

DYMOND, JONATHAN, 1796–1828; an English writer, a member of the Society of Friends. He was an expositor of the moral principles of his sect, and though actively engaged in business, published, in 1823, an *Inquiry into the Accordance of War with the Principles of Christianity*, which attracted wide attention. He also wrote *Essays on the Principles of Morality, and on the Private and Political Rights and Obligations of Mankind*, published after his death.

DYNAMETER, an instrument for measuring the magnifying power of a telescope. The power of a telescope is found by dividing the solar focal distance of the object glass by the focal distance of the eye-piece; which quotient equals that of the effective diameter of the object glass, by the diameter of the image formed at the solar focus, and seen through the eye-piece. The object of the dynameter is to measure the diameter of this image. Ramsden divided a positive eye-piece into two equal parts, and caused the halves to slide along at the dividing line, by means of a fine screw apparatus. Each half lens gives a separate image, and the distance of the two centers, measured by the turns of the screw which bring the images into contact, gives the distance between the centers of the images, or the diameter of one of them.

DYNAMICS is that division of mechanics (q.v.) which contains the doctrine of the motion of bodies produced by forces. It is essentially a science of deduction from the laws of motion (see MOTION, LAWS OF), under which head will also be found a brief sketch of the growth of the science. The branches of D. capable of being treated in the present work will be found discussed under separate heads. We shall here confine

ourselves to giving a view of the main branches and their correlation. I. The first branch of D. deals with the fundamental conceptions of the science, their names and definitions, such as velocity (q.v.) and the different kinds of motion (q.v.), and accelerated motion (q.v.); force, accelerating force, and moving force (see FORCE). Under this branch also falls the composition of motions (see COMPOSITION OF FORCES AND MOTIONS). II. The second main branch of D. treats of the motion, free or constrained, of points. Here two problems are solved in each case—i.e., whether the motion be free or constrained—viz., a direct and an inverse problem; as, for example: 1. To determine the path of a point when the forces are given which act upon it; 2. To determine the forces or force acting on a point when its path is given. This division of dynamical problems into direct and inverse, obtains in all the branches. It may be mentioned that it was by solving the inverse problem that Newton and Huygens effected their greatest glories in connection with dynamics. The method of treating the case of a free point now generally employed, is due to Euler. See, under this head, CENTRAL FORCES; FALLING BODIES, and PROJECTILES. III. The third main branch of D. is concerned with the motion of a rigid system of points, or of a solid body. Few of the sub-branches of this part of D. are capable of exposition in this work, but see CENTER OF GYRATION, CENTER OF OSCILLATION, CENTER OF PERCUSSION, and PENDULUM. The honor belongs to D'Alembert of establishing a general method of treating problems in rigid dynamics. Previous to his time, each set of such problems was treated on some principle peculiarly applicable to itself. D'Alembert invented one (which goes by his name) applicable to all such problems. For a statement of this principle, see RIGID DYNAMICS. IV. The fourth main branch of D. is concerned with motions of rotation. A system of rigid points may be subject to two independent kinds of motion. It may suffer a motion of *translation* in space, or a motion of *rotation* about some point or axis within itself, or it may suffer at once a motion of translation and a rotatory motion. These may clearly be treated conjunctly or independently; they are now uniformly treated independently, by investigating, 1. The velocity and direction of the center of gravity of the system; and 2. The direction at each instance of the spontaneous axis of rotation passing through the center of gravity (see ROTATION), and the velocity of the rotation of the system round that axis. To effect the second task, Poinsot proposed his theory of couples (q.v.). For the conservation of living forces (*virium vivarum*), and the principal of least action, see FORCES. See also MOMENT. D. is used by some recent writers with a wider signification, as denoting the science which investigates the action of force (1) in compelling rest or preventing change of motion, and (2) in producing or changing motion; the former branch being called *statics*, and the latter *kinetics*.

DYNAMIC UNITS are units for measuring forces and their effects. It is an axiom of mechanics that if a body at rest be impressed by a force, and meet no resistance other than its own inertia, it will move in a straight line with a velocity which varies as the force; e.g., twice the force will develop twice the velocity. Also, if the mass of the body be increased, the force must be increased in like ratio to maintain the same velocity; e.g., double the mass will require double the force; or, if the force remain unchanged, double the mass will move with half the velocity. Combining the two statements, we find that the velocity varies directly as the force, and inversely as the mass; velocity equals force divided by mass, or $v = \frac{F}{M}$. From this we have $F = Mv$. The unit of force is that force which will impart a unit of velocity to a unit of mass; that is, which will cause a unit of mass to move through a unit of space in a unit of time. If the force considered be that of gravitation, whose action in the same place is practically uniform, and if we remember that the measure of the force of gravitation in a body is the weight of the body, we have $W = Mv$. But if the mass be submitted to the force of gravitation, that is, if it be permitted to fall freely in a vacuum, it traverses a space of 32.16 ft. in one second, at New York, approximately. We have then, by experiment, a value for v which makes our equation $W = M \times 32.16$, whence $M = W \div 32.16$. The English or American unit of force is one pound avoirdupois; and the corresponding unit of mass is 1 lb. divided by 32.16.

The *unit of work* is the force which will raise a unit of weight through a unit of space. The two items are indicated in the name foot-pound, which by analogy might be exchanged in proper ratio for inch-ounce, ton-mile, etc. The corresponding French unit of work is the kilogram-meter. More generally the foot-pound is the work of a unit of force acting through a unit of space. The horse-power is an arbitrary unit, being the force required to perfom 33,000 units of work in one minute. It may be called the *unit of the rate of working*. The French *cheval a vapeur* is 75 kilogram-meters per second, and is equal to 32.550 foot-pounds per minute, or a little less than our horse-power. The theoretical horse-power is merely a conventional quantity, the actual work of horses averaging about 17,000, and rarely exceeding 22,000 foot-pounds per minute.

DYNAMITE, a powerful explosive compound, now much used in mining, in breaking up old metal, in torpedoes, etc. The names lithofracteur, glyoxiline, nitrate of methyl, etc., are applied to the same or similar substances, of which nitro-glycerine is the main ingredient. See NITRO-GLYCERINE.

DYNAMOM'ETER, a device for measuring the force which does work in overcoming resistance and producing motion. The foot-pound, as a unit of work, has for its factors the force acting and the distance through which it acts. The larger unit, the horse-power, besides these factors has a third, the time during which the force is exerted. Hence, in getting the data from which the work of a machine is to be calculated, we are to observe the force, the distance, and the time required to accomplish a certain result. Strictly speaking, the dynamometer indicates the first of these items, but it may be so arranged as to show both the others. Dynamometers are designed to indicate the force of *traction, of thrust, or of rotation.* A traction dynamometer may be interposed, for example, between a team of horses and a reaper or a plough, to measure the force exerted by the horses in drawing the machine. It is usually some sort of spring balance, fitted with an index and a scale; the figures on the scale show the number of pounds required to bring the index to the corresponding points, if the instrument were hung up and weights suspended by it. A dynamometer for thrust is often connected with the screw-shaft of a steamship, to measure the force with which the screw is driving the vessel through the water. Rotary dynamometers measure the force of a mill-shaft, either by showing what force is required to hold the shaft in check, by absorbing the motion, or what force the shaft transmits to other machinery. Nearly all forms of dynamometers are too complex to be described without the help of elaborate drawings and technical descriptions, for which the reader is referred to special works on mechanism. The use of the dynamometer in skillful hands has acquired great value in exchanging the rough and usually overestimated guesses of the efficiency of machines for the exact determination of their performance.

DYRRHA'CHIUM. See DURAZZO, *ante.*

DY'SART, a royal, parliamentary, and municipal burgh and seaport in the s. of Fifeshire, on the rocky shore of the firth of Forth, 12 m. n.n.e. of Edinburgh. It chiefly consists of 3 streets, with a small square. In the High street are many antique houses, with inscriptions and dates. It has ship-building, flax-spinning, and manufactures of damasks and ticks. In the vicinity are coal and ironstone mines. Pop. '71, 8,919. It unites with Kirkcaldy, Burntisland, and Kinghorn, in sending a member to parliament.

DYSCRA'SIA (Gr. *dys,* difficult, and *krāsis,* a mixture), a pathological term much used in Germany by certain authorities, to indicate an altered condition of the blood and fluids of the system, leading to constitutional diseases, as dropsy, cancer, delirium tremens, lead-poisoning, etc. See CACHEXIA and DIATHESIS.

DYSENTERY (Gr. *dys,* difficult, and *enteron,* the intestine), a form of disease attended by discharges from the bowels, and differing from diarrhœa (q.v.) chiefly in being attended by marked fever and pain, as also by the presence of blood and inflammatory products in the discharges. Dysentery is, in fact, a disease of the mucous membrane of the colon (q.v.) or great intestine, and when severe, it is followed by the destruction of that mucous membrane to a great extent, the intestine becoming much contracted at intervals, especially in its lower part, and the evacuations being therefore apt to be retained, especially the solid portions. The most distinctive symptoms are excessive pain in evacuating the bowels, and frequent ineffectual attempts at evacuation (*tenesmus*), tenderness on pressure in the left side of the abdomen, discharges of blood mixed with mucus, and comparatively little fecal matter; these symptoms being accompanied or followed by intense fever, passing into early depression of strength. Dysentery is a disease of extreme danger in many cases, and should always be placed early under medical treatment. The best domestic plan, when medical advice cannot be at once procured, is to give a moderate dose of castor-oil, guarded by 20 or 30 drops of laudanum, and then either Dover's powder in ten-grain doses every hour or two, or ipecacuanha wine in two or three successive teaspoonful doses at similar intervals, each with 10 or 20 drops of laudanum, according to the effect on the system. If vomiting is repeatedly produced, the dose of ipecacuanha wine should be lessened. If the pain and irritation of the bowels are extreme, the opium had better be given by a small injection (see CLYSTER) with starch, after the lower bowel has been well cleansed by a larger warm-water injection; and it will be well to repeat the simple warm-water injection at intervals throughout the treatment. Dysentery, in its most severe forms, is commonly a disease of the tropical zone. It is often found in connection with inflammation of the liver.

DYSENTERY (*ante*). Two forms of dysentery are usully recognized by medical authorities, sporadic and epidemic. The causes, however, are supposed to be the same in both. It is essentially a disease of hot weather, or hot climates. There being no doubt of the epidemic character of the disease in certain seasons and in certain localities, it follows that a peculiar poison must be the generating cause, heat perhaps operating to aid in generating the poison or contagious matter. Post-mortem examinations show the mucous membrane of the colon and rectum (see ALIMENTARY CANAL) to be the seat of much morbid action. Extensive ulcerations are frequently found, which are the seats of the hemorrhage or bloody discharges, having been caused by the inflammation of the parts, abundant evidence of which exists, the membrane often being found greatly engorged with blood, thickened and pulpy, in some cases of a very dark color and almost disorganized. The portal circulation (see LIVER) is greatly obstructed

in nearly all cases, probably in all severe cases, and it is certain, under the circumstances, that the peculiar *materies morbi* or morbid principle or matter of dysentery paralyzes or greatly arrests the functions of this organ. Now, as all the blood from the intestines passes through the liver on its return to the lungs and heart, the functional disturbance which exists in this organ must necessarily produce more or less obstruction in the capillary circulation in the intestines, and greatly interfere with their nutrition and relative functions. Practically, therefore, the treatment of the disease involves the consideration of those remedies which are supposed to exert a decided influence upon the functions of the liver. One of these remedies, which has been greatly lauded, and also greatly condemned, is mercury, particularly that preparation of it called *calomel;* one party contending that the administration of the drug in minute and repeated doses (especially when alternated with alkaline carbonates to restore the alkalinity of the blood) exerts a powerful influence in restoring the tone of the capillary circulation in various organs, and consequently their functional activity; above all, that this power is peculiarly manifested with reference to the liver; and they adduce numerous examples to establish the correctness of their opinions. On the other hand, several eminent authorities deny the correctness of the theories and positions of these advocates, and affirm that their experience and experiments, as well as all sound therapeutical theories, are decisive against the opinion that calomel possesses the peculiar virtues which are claimed for it. If this remedy be used, it should be in minute and frequently repeated doses—$\frac{1}{8}$ to $\frac{1}{4}$ of a grain every 2 hours; and sometimes oftener—$\frac{1}{16}$ to $\frac{1}{8}$ of a grain every hour. It should always be combined with sufficient opium in some form to allay the griping and other pain, and arrest the straining. Alkaline carbonates should also be given. It is recommended by many authorities that when a laxative is given in the commencement of the treatment, a saline, as sulphate of magnesia or Rochelle salts, should be preferred. Hygienic measures are of the greatest importance. The strictest attention should be paid to cleanliness and ventilation. Pure, fresh air is necessary, not only as a tonic to the nervous system, but as one of nature's principal means of eliminating effete and poisonous matter. Counter-irritants in the form of sinapisms, made weak and continued, are frequently of great advantage in aiding to restore the capillary circulation in the diseased parts, by arousing a reflex influence in the nervous system. The diet is of no secondary importance, and should be bland and nutritious. Eggs, raw or very slightly boiled, mixed with Catawba or sherry wine, or brandy; rice water, as a beverage, combined or alternated with beef-tea, will often afford nourishment not easily supplied in other ways. Rare beefsteak, if chewed and the juice swallowed, often affords a good form of food; toast and tea also may be taken. Tea for the sick-room should always be of the most delicious kind, and freshly prepared, and *weak*. Pure water, actively boiling, should be poured upon a proper quantity of tea in an earthen vessel, and allowed to stand not more than two or three minutes before being turned off, as the continued presence of the leaves allows of the absorption of too much tannin and other extractive matter, by which the fragrance and best qualities of the beverage are injured.

DYSLYSINE is an organic substance ($C_{18}H_{36}O_6$) obtained by boiling choloidic acid with hydrochloric acid for some time. It is a neutral resinous body, which is difficultly soluble in naphtha, turpentine, and other common solvents.

DY'SODIL, a yellow or grayish laminated bituminous mineral, often found with lignite. It burns vividly, and diffuses an odor of asafetida.

DYSPEPSIA (Gr. *dys*, difficult, and *pepsis*, digestion), a scientific term for indigestion (q.v.).

DYSPHO'NIA, signifying primarily difficult speaking, of which the most common example is the disease popularly known as "clergyman's sore-throat." It is attended with inflammation, huskiness, coughing, expectorating, and sometimes ulceration. Rest of the vocal organs, muscular exercise, tonics, and change of air and scene, are helpful towards recovery. It is a recent theory that, with preachers, this trouble arises from the forcible use of the voice only one day in seven, after six days of quietness—the injury arising not from the use, but from the sudden and violent change involved in the use; thus indicating as a remedy or preventive such daily vocal exercise as shall avoid a sudden strain on any one day.

DYSPNŒ'A (Gr. *dys*, difficult, and *pnœa*, breathing), a word the meaning of which is sufficiently indicated by its etymology. See ASTHMA; RESPIRATION, ORGANS AND PROCESS OF.

DYSU'RIA (Gr. *dys*, difficult, and *ouros*, urine), a difficulty of passing urine. It may depend on a variety of causes, as regards which, see BLADDER; and URETHRA.

DYTISCUS (Gr. *dytes*, a diver), a Linnæan genus of aquatic coleopterous insects or water-beetles, now forming the tribe or family *dytiscidæ*. They are *pentamerous* coleoptera; that is, have all the *tarsi* five-jointed. Their general form is oval, the outline little broken, and the surface very smooth. The respiratory organs of the perfect insect are not adapted to the extraction of air from water, and it must occasionally come to the surface to breathe, where it rests for a short time back downward, and with the extremity of the abdomen exposed to the air, the openings of the air-tubes being in the last

segment. The *dytiscidæ* are excessively voracious, feeding upon any kind of animal food, and boldly attacking creatures larger than themselves. They are very amusing inmates of the fresh-water aquarium, and sometimes live in it for a year or two, getting tame, and readily coming to be fed with small earth-worms, bits of beef, etc. The species are numerous, and vary much in size, some being very small, and some almost 2 in. in length. A very common British species is *D. marginalis*, about an inch and a quarter in length, of a dark olive color, the thorax and outer sides of the elytra margined with yellow. All the species are found in lakes, ditches, marshes, and the still parts of rivers. They often leave the water by night, and can fly well. Their larvæ have the body long and tapering, composed of eleven rings or segments, besides the head. They hide themselves in the earth, in chambers which they make for themselves, before changing into pupæ.

DY'VEKÉ (i. e., *dove*), called by the Latin chroniclers Columbula, the mistress of Christian II. of Denmark, has been often celebrated in works of poetry and fiction. She was born in Amsterdam in 1488, and Christian became acquainted with her in 1507, in Bergen, where her mother, Sigbrit Wylms, had settled as an innkeeper. She followed him to Opslow, and, when he mounted the throne, to Copenhagen. Notwithstanding the marriage of Christian with Isabella, the sister of the emperor Charles V., his relation with D. was continued, and her mother acquired unbounded influence in the affairs of the country. Though D. herself never interfered, she was naturally hated by the party of the nobles; and her death, which happened suddenly in 1516, was attributed, with almost certainty, to poison. The poison was understood to have been administered to her in cherries by the noble and proud relations of the governor of the palace, Torben Oxe, who was a suitor for the affections of Dyveké. On her death, the character of Christian broke out in all its savageness. He first ordered the treasurer Faaburg to be executed for having said that Torben Oxe had enjoyed the favor of D.; and then at the instigation, as was given out, of a nightly vision, Torben Oxe himself. Samsöe, a Danish poet, wrote, about the end of the 18th c., a tragedy called *Dyvĕke*, often represented in Copenhagen. The story has since been made the subject of several novels and tragedies; e. g., *Wilhelm Zabern*, by J. C. Hauch, a Dane; and Riekhoff's tragedy, *Düveke* (Berl. 1843).

DY'VOUR AND DYVOUR'S HABIT (from the Fr. *devoir*, to owe; a debtor). In the old legal language of Scotland, a D. seems to have been synonymous with a bankrupt. Skene speaks of a D. or "bairman" (bare-man), as one who, "being involved and drowned in debts, and not able to pay or satisfy the same, for eschewing of prison and other pains, makes cession and assignation of all his goods and gear in favor of his creditors, and dons his devour and duty to them, proclaiming himself bairman and indigent, and becoming debt-bound to them of all he has." It was ordained by act of sederunt (q.v.) of 17th May, 1606, that a pillory be erected near the market cross of Edinburgh, with a seat upon it, upon which dyvours shall be exposed once on a market day; and before their liberation from jail, they are required to provide themselves with a hat or bonnet of yellow color, to be worn by them while thus exposed, and constantly thereafter, while they continue dyvours, under pain of three months' imprisonment if they be found without it. By subsequent acts (26th Feb., 1699, and 23d Jan., 1673), the dyvour's habit is appointed to be a coat or upper garment, half yellow and half brown, with a party-colored cap or hood, to be worn on the head; any of his creditors being entitled to imprison him if he be found without it. The act of sederunt of 18th July, 1688, prescribes as the dyvour's habit, "a bonnet, partly of a brown and partly of a yellow color, with uppermost hose, or stockings, on his legs, half brown and half yellow colored, conform to a pattern delivered to the magistrates of Edinburgh, to be keeped in their tolbooth;" and declares that the lords will not hereafter dispense with it, unless in the case of innocent misfortunes. Finally, by statute (1696 c. 5), the lords of session are prohibited from dispensing with the dyvour's habit unless, in the process of cessio bonorum (q.v.), the bankrupt's failure be alleged and proved to have been by misfortune. This statute is repealed, and the dyvour's habit abolished, by 6 and 7 Will. IV. c. 56—previous to which time the barbaric practice of wearing the habit had, by sufferance of the court, been departed from.

DZE'REN. See ANTELOPE

DZIG'GETHAI, DJIGGETAI, KIANG, KHUR, or GOOR, *Equus hemionus*, a quadruped nearly allied to the ass, and believed to be the *hemionus* of Herodotus and Pliny. See Ass. It inhabits the elevated steppes of Tartary, extending into the s. of Siberia and to the borders of India. In appearance and characters, it is intermediate between the horse and the ass, whence the ancient Greek name *hemionus* (half-ass). In size it approaches the horse, which it resembles also in gracefulness of action, and in its neighing, which is even more deep and sonorous. Its general shape is much like that of a mule. The D. lives in small herds, sometimes of several males and several females, sometimes of a single male with about twenty females and foals. It is an animal of great fleetness and shyness, or watchfulness, and possesses also great powers of endurance in flight, so that it is with difficulty killed by the hunter. The Mongols and Tungûs, however, hunt it very eagerly on account of its flesh. It has been domesticated

and reduced to the service of man, but there does not seem to be any evidence of its ever breeding in a state of domestication.

DZUNGA'RIA, or SONGARIA, a former Mongolian kingdom of central Asia, destroyed by the Chinese invasion about 1757–59. It included most of that part of central Asia extending from 35° to 50° n., and from 72° to 97° east. A part of this territory is now known as the Chinese province of Thian-Shanpelu.

E

E, THE fifth letter in the Greco-Roman alphabets. Its original and fundamental sound is that heard in Eng. *tent.* The sound heard in *me* is not given to it in any language but English. In the series of vowels it stands intermediate between *i* and *a*. See LETTERS AND ARTICULATE SOUNDS, where the various vowel-sounds represented by the character *e* in English will be noticed.

E, in music, is the third note or sound of the natural diatonic scale, and is a third above the tonic C, to which it stands in proportion as 5 to 4. As a major third, that is, when the tonic C vibrates 4 times, the E above vibrates 5 times. E is the third harmonic which arises naturally from C as a fundamental note. E major, as a key, has four sharps at its signature, viz., F, C, G, and D sharp. E minor, as a key, has only one sharp, F, same as G major, of which E is the relative minor.

EACHARD, JOHN, D.D., 1636–97; an English divine, educated at Cambridge, where he became master of Catherine hall. He was a doctor of divinity, and for two terms vice-chancellor of the university. He published a number of half-satirical attacks upon the clergy, among them *The Ground and Occasions of the Contempt of the Clergy inquired into, in a Letter to R. L.*; and, in answer to attacks upon this work, he issued *Some Observations, etc., in a Second Letter to R. L.* He attributed the contempt into which the clergy had fallen to their imperfect education, their insufficient incomes, and the want of a true vocation, giving amusing illustrations of the poverty and absurdity of the pulpit oratory of the day. In a similar vein of satire, he attacked the philosophy of Hobbes. Swift called him a successful humorist who failed as a serious writer.

EADIE, JOHN, D.D., LL.D., 1810–76; b. Scotland; educated at Glasgow university, and in 1835, ordained minister of the Cambridge street Secession church in Glasgow. In this position he took part in the union, in 1847, of his denomination with the Relief church, under the name of the United Presbyterian church. He became the leading representative of the latter denomination. Most of his written works were in connection with biblical criticism and interpretation. Among them were a *Biblical Cyclopædia;* an *Analytical Concordance; Early Oriental History; Life of Dr. Kitto;* and *History of the English Bible.*

EADMER OF CANTERBURY, a man of considerable mark in the beginning of the 12th c., would seem, from his name, to have been the child of English parents. At an early age, he entered the Benedictine monastery of Canterbury; and when St. Anselm, in 1093, was made archbishop of that see, Eadmer became one of his most devoted friends, sharing his exile, watching his death-bed, ordering his burial, and writing the chronicle of his life. Eadmer continued at Canterbury, in high esteem with St. Anselm's successor, archbishop Ralph, until 1120, when, at the request of king Alexander I., he went to Scotland, and was there chosen bishop of St. Andrews. The question of lay investiture of ecclesiastical benefices was then in its crisis; there was a controversy between Canterbury and York for jurisdiction over the see of St. Andrews; that see, again, asserted its independence of either of the English metropolitans; and Eadmer seems to have added to all these perplexities a difficulty as to his monastic allegiance. "Not for all Scotland," he said to the Scottish king, "will I renounce being a monk of Canterbury." The king, on his side, was equally unyielding; and the issue was the return of Eadmer to his English monastery, unconsecrated, indeed, but still claiming to be bishop of St. Andrews. He was made precentor of Canterbury, and died, it is supposed, in Jan., 1124. He tells us that, from his childhood, he was a diligent observer of contemporary events, especially in church affairs; and this habit has given more than usual interest to his writings. The most valuable are his *Historia Novorum,* or history of his own times, first printed by Selden in 1623, and his *Vita Anselmi,* or Life of St. Anselm, first published at Antwerp in 1551. Both these works are included in the selection of his writings published by the Benedictines of St. Maur (as a supplement to their edition of the works of St. Anselm), in 1 vol. fol. (Paris, 1721). His lives of St. Odo, St. Dunstan, and St. Bregwyn, of Canterbury, and of St. Wilfrid and St. Oswald, of York, were printed, some of them, by Wharton, in the second part of his *Anglia Sacra* (Lond. 1691), and others by Gerberon in his *Anselmi Opera* (Paris, 1675). The history of Eadmer, in relation to the bishopric of St. Andrews, is given at considerable length by lord Hailes, in his *Annals of Scotland,* vol. i. pp. 59–71; and, still better, in Mr. Grub's *Ecclesiastical History of Scotland,* vol. i. pp. 209–217 (Edin. 1861).

EADS, JAMES B., b. Ind., 1820; in early life engaged in navigation on the western rivers; went into the business of recovering sunken boats and cargoes, in which he made a fortune. When the rebellion began he offered plans for the defense of the western rivers, and undertook the construction of iron-clad gun-boats. In 1862, he built six iron-proof propellers, having two turrets each, in which he tried many of his own inventions. He is the constructor of the Illinois and St. Louis bridge, and of the important works for deepening the channel at the mouths of the Mississippi. See JETTY.

EAGLE (*aquila*), a genus of birds of prey, by some naturalists subdivided into several genera, constituting a group which contains the largest and most powerful of the *falconidæ*. From the most ancient times, the E. has been universally regarded as the emblem of might and courage; and, like the lion, it has been fancifully invested with other attributes of greatness, such as men thought to harmonize with these. Its extraordinary powers of vision, the vast height to which it soars in the sky, the wild grandeur of the scenery amidst which it chiefly loves to make its abode, and perhaps also its longevity, have concurred to recommend it to poetic regard. It was associated with Jupiter in the Roman mythology; its figure on the standards of the Roman legions expressed and animated their confidence of victory.

The eagles have the beak not curved from the very base, like the true falcons, nor notched on the edge, neither are their wings so long in proportion to their size. Their wings are, however, very broad and expansive; their legs are very robust; their claws curved, sharp, and strong. In the most restricted use of the generic term, the true eagles, of which the golden E. may be taken as a type, have a rather short bill, curved from the cere, with a slight festoon on the edge of the upper mandible, the tarsi are short, and feathered down to the toes. This last character distinguishes them at once from the ernes (q.v.), often also called eagles. There are several species of true eagles well ascertained, although in this as in allied genera much confusion has arisen from the diversity of plumage at different ages.—The GOLDEN E. (*A. chrysaëtos*)—of which what is called the ring-tailed E. is the young—is about 3 ft. or 3 ft. and a half in length, and 8 ft. in spread of wing. The female is rather larger than the male; the color is dark brown, in some parts almost black, the head and back of the neck in mature birds covered with pointed feathers of a golden-red color; young birds have a considerable part of the tail white. The golden E. is the largest of the European eagles, and is found not only throughout Europe, preferring wild and mountainous situations, but throughout almost the whole northern hemisphere: it is amongst the birds of India, of the n. of Africa, and of North America; and the savage warrior of the Rocky mountains, "as well as the Highland chieftain, glories in his E. plume." Although occasionally seen in all parts of Britain, it builds its nest only in mountainous districts, carrying a few sticks and brambles to the inaccessible shelf of a rocky precipice, where the eggs are deposited almost on the bare rock. The golden E. is now rare even in the Highlands of Scotland. A great quantity of prey is necessary to support a pair of these birds and their two or three young ones; and not only hares, game of every kind, and lambs are carried to the eyrie, but larger animals are sometimes attacked, and almost every district where eagles build their nests has its stories of children carried off to feed the eaglets, and often of their almost miraculous preservation.—The next in size to the golden E. among the eagles of Europe is the imperial or Grecian E. (*A. imperialis*), but it is more common in Egypt than in Europe, and has never been seen in Britain.—The spotted E. (*A. nævia*) has occurred in the s. of Ireland.—There is an Australian E. (*A. fucosus*).

Eagles were ranked among what were called, in the language of falconry, ignoble birds of prey, as incapable of being tamed and employed to assist in the sports of man. But either the golden E. or the imperial E. is used by the Tartars in the chase of antelopes, wolves, foxes, hares, etc.

The white-tailed E. or cinereous E. of Britain is the common erne (q.v.). The white-headed E. or bald-headed E. of America—the chosen emblematic E. of the United States—is also an erne. What particular species was the emblematic E. of the ancients, is not more certain than what is the original emblematic Scotch thistle.—Others of the E. group of *falconidæ* are known as marsh eagles, harpy eagles, eagle-hawks, ospreys, etc., some of which will be noticed in their places.

EAGLE, the king of birds, is used heraldically as an emblem of magnanimity and fortitude. It is variously represented, the best known mode being displayed (q.v.) or spread out, either with two heads—as in the arms of the Austrian empire, in which case it is popularly known as a spread eagle—or with one head, as in the arms of the German empire.

EAGLE, as a military standard, was adopted by the Romans, and even by nations preceding them in history. The Persians in the time of Cyrus the younger, bore an E. on a spear as a standard. The Romans for some time used the E., the wolf, the boar, the horse, and the minotaur for standards, but afterwards abandoned the last four, and confined themselves to the first. The Roman E., sometimes of gold, but more frequently of silver, was about as large as a pigeon with extended wings, and was borne on the top of a spear, with a cross-bar or a shield to support it. Some of the eagles were represented as holding thunderbolts in their talons, and usually bore the name of

the legion to which each respectively belonged. The E. was sometimes made of steel, but rarely.

In modern times France, Russia, Prussia, Austria, and the United States of America, have all adopted the E. as a national military symbol. The Austrian E. is represented double-headed.

EAGLE, a gold coin of the United States of America, of the value of ten dollars. See DOLLAR.

EAGLE, BLACK, ORDER OF THE, in Prussia, was founded by the elector of Brandenburg, on 17th Jan., 1701, the day of his coronation as king of Prussia. The number of knights, in addition to the princes of the royal family, was originally 30, but it is now unlimited. They must at their nomination be at least 30 years of age. They must prove their noble descent for four generations through both parents. A chapter is held twice a year.

The insignia of the order consist of an octagonal cross of blue enamel, and a black eagle, displayed between each of the arms of the cross. The cross is suspended by a broad ribbon of orange color across the left shoulder, and it is accompanied by an embroidered silver star, fastened on the left breast. The center of the star represents a black flying eagle, holding in one claw a laurel wreath, and in the other a thunderbolt, with the legend, *Suum cuique*. Fifty ducats must be paid by every new member for the support of the orphan asylum at Königsberg, and he then receives gratis the costume and insignia of the order, of which a full description will be found in Burke's *Orders of Knighthood*, p. 199. As the black eagle is the highest order in Prussia, no member of it, with the exception of foreign princes and knights of St. John, is permitted to wear any other order along with it; and as it is generally granted only to those who are expected to be about the person of the king, no one who holds it is permitted to travel from the court more than 20 German miles without giving notice. Knights of the black eagle are likewise knights of the red eagle (q.v.), first class.

EAGLE, RED, ORDER OF THE, in Prussia, founded in 1734 by the markgraf George Frederick Charles, as a reorganization of the "Ordre de la Sincérité," which had been instituted in the beginning of the century by the hereditary prince of Anspach and Baireuth. After passing through various modifications, the order of the red eagle was raised in 1791 by Frederick William II. to the rank of the second order in the monarchy, and it was then that the decoration of a white enameled Maltese cross, surmounted by a royal crown, with the Brandenburg eagle in the corner, was adopted. All the knights of the black eagle were received into this new order; and it was latterly decreed that only those who had been decorated with the red eagle, in the first instance, could be received into the black. In 1810, the order of the red eagle was reorganized, and two more classes were added to it. In 1830, the second class was subdivided into two, one of which only was allowed to wear a square star.

EAGLE HAWK, *Morphnus* or *Spizaëtus*, a genus or sub-genus of *falconidæ*, of the eagle group, but consisting of species of comparatively small size, and characterized by short wings, long slender legs (*tarsi*), and comparatively feeble toes and claws. Some of the species are extremely beautiful in form and colors. They are natives of warm climates, chiefly of South America, but also of Africa and the East Indies. The crested eagle (*M. cristatus*) of Guiana, and the Brazilian eagle, or urubitinga (*M. urubitinga*), may be mentioned as examples. The latter, although not so large as a goose, is sometimes called the Brazilian eagle.

EAGLE OWL, *Bubo*, a genus of the owl (q.v.) family (*strigidæ*), characterized by a somewhat incomplete facial disk, two tufts of feathers (*horns* or *egrets*) of considerable size on the head, ears with small openings (*conchs*), legs and toes covered with feathers, short strong curved bill, and long curved sharp claws. To this genus belong the largest of the nocturnal birds of prey. The E. O. of Europe (*B. maximus*) is little inferior in size to the golden eagle, and preys on quadrupeds such as hares, rabbits, and young deer, and on grouse, partridges, and other kinds of game. It seizes its prey with its feet, and seldom touches it with the bill till its struggles are over. It is an inhabitant of many parts of Europe and Asia, but it is only a rare occasional visitor in Britain. The loud peculiar cry of this bird, resounding strangely through the night, has obtained for it its German name of *uhu*, and an intimate association from time immemorial with evil omens and superstitious terrors.—The E. O. of America (*B. Virginianus*), the VIRGINIAN HORNED OWL or GREAT HORNED OWL, is very similar to the species just noticed, but of inferior size, although still a large and powerful, as it is also a bold bird. It does not scruple to attack half-grown turkeys, and often succeeds in making them its prey. It carries off with ease almost any other inhabitant of the poultry-yard. It is found in almost all parts of America.

EAGLE WOOD, an East India tree of which there are three varieties, containing much resin, and an oil which the natives esteem highly as a perfume or incense. Some of the trees are naturally inodorous, but after a disease which often attacks them the wood becomes colored and gives out a powerful scent. It is supposed to be a cure for gout, and in Europe is sometimes prescribed for rheumatic affections.

EA'GRE, another name for the bore (q.v.) in tidal rivers.

EAR, THE, ANATOMY AND PHYSIOLOGY OF. The apparatus of hearing, as it exists in man and the mammalia, is composed of three parts—the external ear, the middle ear or tympanum, and the internal ear or labyrinth.

The *external ear* consists of two portions, the *auricle* or *pinna* (the part popularly recognized as the ear), and the *auditory canal* or *external meatus*.

The auricle, on its outer or more exposed surface, presents various eminences and depressions, resulting from the form of its cartilaginous frame-work. These have received special anatomical names, to which it is unnecessary to advert further than to mention that the deep capacious central space to which several grooves converge, is termed the *concha*, and that the lowest and pendulous portion of the ear is termed the *lobe*. The cartilage forming the basin of the external ear consists of one principal piece, in which there are several fissures, which are filled up by fibrous membrane. Several muscles are described as passing from one part of the auricle to another, but they are so little developed in man that they do not require notice; there are additionally three muscles—the *attollens aurem* (or *superior auris*), the *attrahens aurem* (or *anterior auris*), and the *retrahens aurem* (or *posterior auris*), which pass from adjacent parts of the scalp to the E., and which, though more developed than the previous group, are of little or no real importance in man (at least in his civilized state), but are of considerable use in many mammals. Their actions are sufficiently indicated by their names.

The auditory canal passes from the concha inwards, and a little forwards, for rather more than an inch. It is narrower at the middle than at either extremity; and on this account there is often considerable difficulty in extracting foreign bodies that have been inserted into it. The membrane of the tympanum which terminates it is placed obliquely, in consequence of the lower surface of the meatus being longer than the upper. The canal is parly cartilaginous and partly osseous; the osseous portion consisting in the fœtus of a ring of bone, across which the membrane is stretched, and in many animals remaining persistently as a separate bone. The orifice of the meatus is concealed by a pointed process, which projects from the facial direction over it like a valve, and which is called the *tragus*, probably from being sometimes covered with bristly hair like that of a goat (*tragos*); and it is further defended by an abundance of ceruminous glands, which furnish an adhesive, yellow, and bitter secretion (see CERUMEN), which entangles small insects, particles of dust, and other small foreign bodies, and prevents their further passage into the meatus.

The *middle ear*, or *cavity of the tympanum*, is a space filled with air which is received from the pharynx (q.v.) through the Eustachian tube, and traversed by a chain of very small movable bones, which connect the membrane of the tympanum with the internal ear. It lies, as its name implies, between the external meatus and the labyrinth or internal E., and opens posteriorly into the cells contained in the mastoid portion of the temporal bone, which are also filled with air, and anteriorly into the Eustachian tube. The cavity is of an irregular shape, and is lined by a very delicate ciliated epithelium, which is a prolongation of that of the pharynx through the Eustachian tube.

Its external wall is mainly formed by the membrane of the tympanum, which is nearly oval, and placed in a direction slanting inwards, so as to form an angle of about 45° with the floor of the auditory canal. The handle of the malleus (or hammer), the first of the chain of ossicles, is firmly attached to the inner side of this membrane in a vertical direction as far downwards as the center, and by drawing it inwards, renders its external surface concave.

Its internal wall has two openings communicating with the internal E., each of which is closed by a delicate membrane. These openings are termed, from their respective shapes, the *fenestra ovalis*, and the *fenestra rotunda;* the former leads to the vestibule, and is connected by its membrane with the base of the stapes (or stirrup-bone), the last of the chain of ossicles; while the latter opens into the cochlea.

The ossicles of the tympanum are three—viz., the *malleus*, the *incus* (or anvil), and the *stapes*. We have already explained how the malleus is connected with the membrane of the tympanum by means of its handle. Through this connection, the tension of that membrane may be modified by the agency of one or two muscles which are attached to this ossicle. These muscles are the *laxator tympani*, which arises from the spinous process of the sphenoid bone (q.v.), and is inserted into the processus gracilis; and the *tensor tympani*, which arises from the under surface of the petrous portion of the temporal bone, and is inserted into the handle of the malleus immediately below the commencement of the *processus gracilis*. The existence of the former of these muscles is doubtful, many anatomists regarding the structure in question as ligamentous rather than muscular. The *incus* much more closely resembles a molar tooth with two fangs, than the anvil from which it derives its name. Of the two processes which it gives off, the short one runs backwards, and projects into the mastoid cells behind the tympanic cavity; while the long one inclines downwards, and terminates in the lenticular or orbicular process, to which the head of the stapes is attached. It has a head, neck, two branches, and a base, which, as has been already mentioned, fits into the fenestra ovalis. A minute muscle, the *stapedius*, takes its origin from a hollow conical eminence termed the *pyramid*, which lies behind the *fenestra ovalis*, and is inserted into the neck of the

stapes; by pulling the neck backwards, it probably compresses the contents of the vestibule.

The Eustachian tube, into which the tympanic cavity opens anteriorly, is about an inch and a half in length, and passes downwards, forwards, and inwards to its opening in the pharynx. It is partly bony, but chiefly cartilaginous. Its use is to allow the free passage of air in and out of the tympanum, and to admit of the egress of the mucus secreted in that cavity.

The *internal ear* or *labyrinth* is the essential part of the organ of hearing, being the portion to which the ultimate filaments of the auditory nerve (q.v.) are distributed. It is composed of three parts—viz., the *vestibule*, the *semicircular canals*, and the *cochlea*, which form a series of cavities presenting a very complicated arrangement, and lying imbedded in the hardest part of the petrous portion of the temporal bone. They communicate externally with the tympanum by the two openings already described—the *fenestra ovalis*, and the *fenestra rotunda;* and internally with the internal auditory canal, which conveys the auditory nerve from the cranial cavity to the internal ear. The very dense bone immediately bounding these cavities is termed the *osseous labyrinth*, to distinguish it from the *membranous labyrinth*, which lies within a portion of it.

The *vestibule* is a common central cavity into which the semicircular canals and the cochlea open. It is about a fifth of an inch in height, and in length from before backwards its transverse diameter (from side to side) being somewhat less. On its posterior wall are five orifices for the semicircular canals, one of the orifices being common to two of the canals. Anteriorly, the cochlea enters it by a single opening, the beginning of the *scala vestibuli*. On its outer wall is the fenestra ovalis, and on its inner are the *fovea hemispherica*, containing several minute orifices for the entrance of filaments of the auditory nerve, and the fovea semi-elliptica.

The *semicircular canals* are three in number, and open at both ends into the vestibule. They vary in length, and notwithstanding their name, each is considerably more than a semicircle, the superior vertical canal being the longest. Their average diameter is about a twentieth of an inch, the extremity of each canal exhibiting a dilatation or *ampulla*. Each canal lies in a different plane, very nearly at right angles to the planes of the other two, hence their names of the *superior vertical*, the *inferior vertical*, and the *horizontal* canals.

The *cochlea*, which derives its name from its resemblance to a common snail-shell, forms the anterior portion of the labyrinth. It consists of an osseous and gradually tapering canal, about an inch and a half in length, which makes two turns and a half spirally around a central axis, termed the *modiolus*, which is perforated at its base for the entrance of the filaments of the cochlear portion of the auditory nerve. This spiral canal gradually diminishes towards the apex of the cochlea. At its base, it presents two openings, one into the vestibule, and the other (closed by a membrane, and communicating with the tympanum) being the *fenestra rotunda* already described. Its interior is subdivided into two passages (*scalæ*) by an osseo-membranous lamina. This is the *lamina spiralis*, which divides the cochlea into an upper passage, the *scala vestibuli*, and a lower one, the *scala tympani*. At the apex, these two passages communicate by an opening to which the term *helicotrema* has been applied. Between the two scalæ, there is a third space termed the *ductus cochlearis*, or *scala intermedia*. In this space the filaments of the auditory nerve terminate, by being connected with a complicated arrangement of peculiarly formed epithelial cells, constituting the organ of corbi. For a notice of the membranous portion of the *lamina spiralis*, see AUDITORY NERVE.

We now return to the *membranous labyrinth*. The membranous and osseous labyrinths have the same shape, but the former is considerably smaller than the latter, a fluid, termed the *perilymph*, intervening in some quantity between them. At certain points, recent investigations have shown that the membranous is firmly adherent to the inner surface of the osseous labyrinth. The vestibular portion consists of two sacs, an upper and larger one, of an oval shape, termed the *utriculus*, or *common sinus*, and a lower and smaller one of a more globulous shape, called the *sacculus*.

The membranous semicircular canals resemble in form and arrangement the osseous canals which inclose them, but are only one third of the diameter of the latter. The ultimate filaments of the auditory nerve (q.v.) mainly go to the utriculus, to the sacculus, and to the ampulla of the canals.

The membranous labyrinth is filled by a fluid which is termed the *endolymph;* and in certain spots, especially at the terminations of the vestibular nerves, we observe, both in man and the lower animals, calcareous matter either in a powdered or solid form. In man and mammals generally, and in birds and reptiles, it occurs as a powder, and is termed *otoconia* or *ear-powder*, and it always consists of carbonate of lime.

We now proceed to consider the different functions or offices of the various parts of the organs of hearing.

1. *Of the External Ear.*—A true auricle only exists in the mammalia, and in this class it varies from little more than an irregularly-shaped cartilaginous disk, with little or no motion, as in man and the quadrumana, to an elongated funnel-shaped ear-trumpet, movable in all directions by numerous large muscles, as in the horse, the ass, and the bat.

The mode in which we see it employed by those animals in which it is highly

developed, sufficiently indicates that its main function is to collect and concentrate the sounds which fall upon it. But the experimental investigations of Savart, with an apparatus constructed to resemble the tympanic membrane and the external auditory apparatus, show that these parts are also adapted to enter into vibrations in unison with those of the air; and he suggested that the human auricle, by the various directions of different parts of its surface, could always present to the air a certain number of parts whose direction is at right angles with that of the molecular movement of that fluid, and therefore is the most favorable position for entering into vibrations with it.

2. *Of the Tympanum and its Contents.*—Savart's experiments show that the membrane of the tympanum is thrown into vibration by the air, and that it always executes vibrations equal in number to those of the sonorous body which excites the oscillations in the air. He further ascertained that the malleus participates in the oscillations of the tympanic membrane, and that these vibrations are propagated to the incus and stapes, and thus to the membrane of the fenestra ovalis. The malleus has further the office of regulating, through the *tensor tympani* muscle, the tension of the tympanic membrane; and to allow of the motion necessary for this purpose, we find. movable joints between it and the incus, and again between the latter bone and the stapes. The contraction of the stapedius muscle similarly modifies the tension of the membrane of the *fenestra ovalis;* and as compression exercised on this membrane extends to the perilymph, and is propagated through it to the *fenestra rotunda,* the tension of the membrane of the latter opening is also influenced by the muscle in question. The incus is much more limited in its motions than either of the other bones, and its use seems to be to complete the chain of ossicles in such a manner as to prevent any sudden or violent tension of the membranes, such as we can easily conceive might occur, if the conductor between the membranes were a single bone. The presence of air in the tympanic cavity serves a double purpose: in the first place, it preserves a uniform temperature on the outer surfaces of the fenestral membranes, and thus supports a fixed elasticity in them, which would not be the case if they were freely exposed to ordinary atmospheric changes; and secondly, the action of the chain of ossicles as conductors of sound is materially increased by their being completely surrounded by air, as is obvious from the first principles of acoustics.

3. *Of the Labyrinth.*—Sound is conducted to the labyrinth in three ways: first, by the chain of bones; secondly, by the air in the tympanic cavity; and thirdly, through the bones of the head.

Muller has shown, by very ingenious experiments on an apparatus constructed to resemble, on a large scale, the middle and internal E., that while the air in the tympanum conducts sound to the cochlea, through the *fenestra rotunda,* the chain of bones forms a much better conductor of it to the vestibule, through the *fenestra ovalis* (see the chapter on hearing in his *Physiology*). Hence, we infer that the vestibule is adapted to receive sounds from the membrane of the tympanum and the external E., while the cochlea, on the other hand, as its structure and connections indicate, may be regarded as that part of the labyrinth which is specially affected by sounds communicated through the bones of the head.

That the vestibule is the essential or fundamental part of the organ of hearing, is sufficiently proved by its constancy, other parts gradually disappearing as we descend the animal scale, and by its central position in the ears of the higher animals. The use of the otoconia or ear-powder is to strengthen the sonorous undulations, and to communicate to the membranous vestibule and ampullæ, and to their nerves, stronger impulses than the perilymph alone could impart. The action of otoliths or ear-stones, such as occur in osseous fishes, must be still more decided, and is well illustrated by the following experiment of Camper: Fill a bladder with water, and place a pebble in it. The slightest impulse communicated to the bladder disturbs the pebble, which consequently produces a greater impression on the hand supporting the bladder than the water alone could do.

Nothing certain is known regarding the functions of the semicircular canals, but their constant existence and number* in the vertebrated animals indicate their importance; and in most cases of congenital deafness they are more or less defective. The fact of their position corresponding with the three dimensions of a cube—namely, its length, breadth, and height—has led to the opinion that they are concerned in conveying a knowledge of the direction of sounds. This view is supported by prof. Wheatstone, who believes that we distinguish best the direction of those sounds which are sufficiently intense to affect the bones of the head, and that it is from the vibrations which are transmitted through these bones that our perception of direction is obtained. Thus, if the sound be transmitted in the plane of any one canal, the nervous matter in that canal will be more strongly acted on than in either of the other two; or if it be transmitted in a plane intermediate between the planes of this canal and the adjacent one, the relative intensity with which these two canals will be affected will depend upon, and indicate the direction of the intermediate plane.

The range of hearing, like that of vision, varies remarkably in different persons.

* The only exceptions that we can call to mind are those presented by the myxine or hag and the lamprey—the former has only one, the latter two, semicircular canals. Both are fishes of very low organization.

Some persons are insensible to sounds which others can readily hear. The ordinary range of human hearing comprised between the lowest notes of the organ and the highest known sound emitted by insects includes, according to Wollaston, more than nine octaves, the whole of which are distinctly perceptible by most ears. He relates, however, several cases in which the range, in reference to the perception of high notes, was much less. In one individual, the sense of hearing terminated at a note four octaves above the middle E of the pianoforte, the F above it being inaudible, although his hearing in other respects was as perfect as that of persons in general; another case was that of a lady who could never hear the chirping of the field-cricket; and in a third case the chirping of the common house-sparrow could not be heard. See his memoir on sounds inaudible by certain ears, *Phil. Trans.*, 1820.

The sensation of sound, like that of light, frequently lasts longer than the exciting cause. We have familiar proof of this fact in the noise which remains in the ears after a long journey in a coach or railway; and it was clearly demonstrated by Savart, who found, in his experiments on toothed wheels, that the removal of one tooth did not produce any interruption of the sound.

For diseases of the E., see DEAFNESS.

EAR, DISEASES OF THE. See DEAFNESS and OTITIS.

EAR, in music, is a figurative expression, meaning the possessing of a sensitive, just, and delicate appreciation of sound and measure.

EAR-COCKLES, PURPLES, or PEPPER-CORN, a disease in wheat, owing to the presence of *vibrio tritici*, one of the *infusoria*. This is an animal of worm-like form, yellowish-white, slender, tapering towards the tail, and more suddenly attenuated to a point at the head. Its minute eggs are supposed to be introduced into the sap of the wheat from infected seed, and so to find their way to the flowers, where they are hatched in the germen; the infected grains become dark green, then black, rounded like small pepper-corns, and furrowed on the surface; the glumes spread open, and the awns become twisted; the grains are filled with a white cottony substance, which at once dissolves in water, liberating the *vibrio* in great numbers. Henslow calculates that 50,000 of the young *vibrio* might exist in a grain of wheat. If the wheat is dried, the *vibrio* becomes dormant, but retains its vitality in this state for six or seven years, and is ready to revive on the application of moisture.

EARL (Ang.-Sax. *eorl*—a corruption of *ealdor*). The distinctive name of the noble amongst the northern races was *eorl*, or *jarl*, as opposed to the mere freeman, the *ceorl*, or *karl;* from which latter name come the modern German word *kerl*, and the Scotch word *carl*. From indicating the whole noble class, the title of eorl among the Anglo-Saxons, and perhaps generally among the Teutonic nations, came at first probably to be limited to those who were *ealdors*, or *ealdormen*, by office—that is to say, to those who were appointed to be at once governors and judges over a certain district, and to whom, according to Kemble (*Saxons in England*, ii. p. 126), the titles of *dux*, *princeps*, and *comes* are indiscriminately applied by the Latin writers, the same officer being sometimes called by the one title, and sometimes by the other. Being thus limited to those who held the office of ealdors, the social not unnaturally came to be confounded with the official title, and hence the general error of tracing the word earl not to *eorl*, a noble, but to *ealdorman*, a title which Mr. Kemble prefers to translate by duke. The early relation which subsisted between the duke and the count has been explained under the former title. In Europe generally, it was not till the count came to be recognized as a subordinate officer to the duke, governing a district of the province committed to the latter, that the earl assumed the position of the governor of a county, by the name of which he was commonly known. The title of duke, if it had ever existed, early disappeared in England, and was not revived till the time of Edward III. After the Norman conquest, the French term count was substituted for earl; but it held its place only for a very short time as the title of the officer, though it has continued ever since to give a name to the district over which he presided, and a title to his wife. William the conqueror, after the battle of Hastings, recompensed his chief captains by granting to them the lands and offices of the Saxon nobles; but by making the title of earl hereditary, he took, unintentionally perhaps, the first step towards changing it from a title of office to a title of dignity, and thus depriving it of substantial power. Deputies, *vice-comites*, or sheriffs, came necessarily to be appointed in all cases in which the earl was a minor, or otherwise incapacitated from discharging the duties of the office, till gradually the office itself passed to the deputy; the dignity alone, with the hereditary privilege of sitting as a legislator in the house of lords, remaining with the principal. The form of creation of an earl formerly was by the king girding on his sword, and placing his coronet on his head, and his mantle on his shoulders; but earls are now created by letters-patent; and it is not unusual for them to depart so far from the old notion of their being territorial officers, as to take as their titles their own names, with the prefix earl—e.g., earl Grey, earl Spencer, earl Russell, etc. At present, the number of earls, including the peerages of Scotland and Ireland, exceeds 200. See PEER.

The EARL'S CORONET is a circle of gold, rising at intervals into eight pyramidal points, or spikes, on the tops of which are placed as many pearls, and which alternate with strawberry-leaves. See CROWN.

EARLE, PLINY, 1762–1832; b. Mass.; inventor of machinery for making cards (for carding wool), by which he reduced the labor of hours to as many minutes. He was more than usually well informed in science and literature.

EARLE, PLINY, b. Mass., 1809; son of Pliny the inventor; educated at a Quaker school in Providence; licensed to practice as a physician in 1837; in 1840, was resident physician in the insane hospital at Frankford, Penn.; in 1844, physician to the Bloomingdale (N. Y.) insane asylum; after 1849, visited all the important insane asylums in Europe; in 1853, became physician to the New York lunatic asylum. Among his publications are: *Marathon and Other Poems; Visit to Thirteen Asylums for the Insane in Europe; History, Description, and Statistics of the Bloomingdale Asylum;* and many articles in the *American Journal of Insanity.*

EARLE, THOMAS, 1796–1849; b. Mass.; brother of Pliny the physician. When young he settled in Philadelphia, where he became a journalist and lawyer. He was active in the Pennsylvania constitutional convention in 1837, and is credited with having made the original copy of the new constitution. In 1840, the liberty party made him their candidate for vice-president, probably because he had broken away from the democratic party by advocating the extension of the right of suffrage to colored men. He published *Essay on the Penal Law; Essay on the Right of States to alter and annul their Charters; Treatise on Railroads and internal Communication; Life of Benjamin Lundy;* and a school spelling-book. At the time of his death he was about finishing a history of the French revolution. In early life he edited the *Columbian Observer; Standard; Pennsylvanian;* and *Mechanics' Free Press and Reform Advocate.*

EARL MARSHAL, an office of great antiquity, and formerly of importance. There seems reason to believe that the marshal of England, afterwards the E. M., was a distinct officer from the marshal of the king's house, but the point is not altogether clear, and there is, consequently, some difficulty in determining which of the offices was held by the Mareschals, earls of Pembroke. For many generations the office has been hereditary in the family of the dukes of Norfolk, though the earls marshal having, to an unusual extent, had the fate to die either childless or without heirs-male, the line of descent has been by no means a direct one. The last grant is by king Charles II., and bears date 19th Oct., 1672. The E. M. presided jointly with the constable over the court of chivalry (q.v.), the last proceedings of which are said to have taken place in 1631. He is the head of the college of arms (q.v.), which has jurisdiction in descents and pedigrees; determines all rival claims to arms; and he grants armorial bearings, through the medium of the kings-of-arms, to parties not possessed of hereditary arms. The office of the lyon in Scotland is generally supposed to correspond to that of the E. M. in England, but not quite correctly. The lyon having been subordinate to the marshal and constable of Scotland, his office was more nearly that of the kings-of-arms in England; with this difference, that it extended to the whole kingdom.

EARLOM, RICHARD, an engraver, whose works in mezzotinto, published during the end of last and beginning of this century, are well known as amongst the best of the period when that kind of engraving was practiced without the admixture of etching, adopted at the present time. His works after Reynolds, his plates from pictures in the Houghton gallery and the *Liber Veritatis,* consisting of imitations of the celebrated drawings by Claude, in the possession of the duke of Devonshire, are standard works in their various departments. He died in 1822, having some time previously retired from his profession.

EARL'S PENNY, an English corruption for Arles penny. See EARNEST.

EARLSTON, or ERCILDOUNE, a village in the s.w. of Berwickshire, on the Leader a n. branch of the Tweed, 30 m. w.s.w. of Berwick. Pop. '71, 1168. E. has been and still is famed for its manufacture of ginghams; it has also a factory for the manufacture of blankets, tweeds, etc. On the left bank of the Leader are the ruins of a building called "Rhymer's tower," as having been the residence of Thomas the Rhymer (q.v.), so famous in Scottish tradition. A mile s. of E. is Cowdenknowes, which is celebrated in song for its "bonny, bonny broom."

EARLY, a co. in s.w. Georgia, on the Alabama border, partially crossed by an extension of the Brunswick and Albany railroad; 500 sq.m.; pop. '70, 6,998—4,172 colored. The surface is level and the soil fertile, producing corn, cotton, etc. The Chattahoochee, on the w. border, is navigable for steamboats. Co. seat, Blakeley.

EARLY, JUBAL A., b. Va., 1818; graduated at West Point, 1837; served in the artillery in the Florida war. He resigned in 1838 to study law; became a member of the bar and of the Virginia legislature, and state attorney. In the war with Mexico he served as major and colonel. He was among the first to volunteer in the service of the rebellion, and at Bull Run was in command of a brigade. Two years later he was brig.gen., and had command of a division at Gettysburg. In 1864, he made a raid through the valley of the Shenandoah, invaded Pennsylvania, and partially burned Chambersburg. The tide of his success was turned by the union gen. Sheridan, who defeated him at Opequan, at Fisher's hill, and at Cedar creek. and he was routed by Custer at

Waynesborough. On account of these disasters he was dismissed from the confederate service. After a trip to Europe, he returned to Richmond, and resumed the practice of law.

EARLY ENGLISH, the term generally applied to the form of Gothic in which the pointed arch was first employed in this country. The early English succeeded the Norman towards the end of the 12th c., and merged into the decorated (q.v.) at the end of the 13th. Its characteristics are beautiful and peculiar. Retaining much of the strength and solidity of the earlier style, it exhibited the graceful forms, without the redundancy of ornament which latterly degenerated into a fault in that which followed. Generally, it may be said to bear to the decorated something like the relation which an expanding rosebud bears to a full-blown rose. The windows are long and narrow, and when gathered into a group, are frequently surmounted by a large arch, which springs from the extreme molding of the window on each side. The space between this arch and the tops of the windows is often pierced with circles, or with trefoils or quatrefoils, which constituted the earliest form of tracery. Each window, however, is generally destitute of any tracery in itself. "The moldings," says Parker, "in general consist of alternate rounds and deeply-cut hollows, with a small admixture of fillets, producing a strong effect of light and shadow."—*Gloss. of Architecture.* Circular windows, however, still continued to be used, and trifoliated archways over doors are also to be found, as at Salisbury cathedral. By far the most characteristic feature of the style is the tooth-ornament (q.v.), which is often used in great profusion. Where foliage is used, it is cut with great boldness, so as to throw deep shadows, and produce a very fine effect. The under-cutting is often so deep as to leave nothing to connect the leaves with the moldings but the stalks, and occasionally the edge or point of a leaf. The term E. E. is said, by Parker, to have been introduced by Mr. Millers in 1805. It corresponds to *Ogivale primitive* of French writers, and is very often known as the first pointed or lancet-arched amongst ourselves. See GOTHIC ARCHITECTURE.

EARN, a river and loch in the s. of Perthshire, in the finely-wooded, beautiful valley of Strathearn. Loch E. lies to the n. of Ben Voirlich; its eastern extremity is 24 m. w. of Perth. It is 7 m. long from e. to w., 1 m. broad, and 100 fathoms deep, and is surrounded by bold and rugged hills. The river E. flows e. from the loch 40 m. through the strath, past Comrie, Crieff, and bridge of E., into the estuary of the Tay, 7 m. s.e. of Perth. Along the river, near Abernethy, under a thick bed of clay, is a peat-bed 2 or 3 ft. thick, supposed to be a continuation of the submarine forest at Flisk.—The bridge of E., a much frequented village, stands on the right bank of the river, 6 m. s.s.w. of Perth, and near the saline springs of Pitcaithly.

EARNEST, or ARLES, as it is called in Scotland, from the civil law word *arrhæ*, is a small sum of money which is given, or a simple ceremony, such as shaking hands, which is performed in proof of the existence of that mutual consent which constitutes a contract. In the first case, the earnest is said to be pecuniary; in the second, symbolical. It is not the E., but the consent, i.e., the agreement to a certain price, that is the root of the bargain; and the E. thus becomes a mere adminicle of evidence, which may be dispensed with even in cases in which it is exacted by custom, if the parties choose to preserve other evidence of the completion of their bargain. The contracts in which E. has been most frequently given both in this country and elsewhere, are sale and service. In the case of sale, it usually consists of a small sum paid by the buyer, by the acceptance of which the seller is held to bind himself to the sale; in the case of service, it is a small sum given by the master, in accepting which the servant becomes bound to serve. The question as to whether the E. shall count as part of the price or wage depends on the intention of the parties, which, in the absence of direct evidence, will be inferred from the proportion which it bears to the whole sum. "If a shilling be given," as Mr. Erskine says, "in the purchase of a ship or of a box of diamonds, it is presumed to be given merely in evidence of the bargain, or, in the common way of speaking, is dead E.; but if the sum be more considerable, it is reckoned up in the price."—*Institutes*, b. iii. tit. iii. s. 5. The original view of E. in England was, that it was a payment of a small portion of the price or wage, in token of the conclusion of the contract (Story on *Sales*, p. 216); and as this view seems to have been adhered to, the sum, however small, would probably there be counted as a part payment. There is only one decision under the 17th section of the statute of frauds (29 Ch. II. c. 3), which provides that "no contract for the sale of any goods, wares, and merchandises, for the price of £10 sterling, or upwards, shall be allowed to be good, except the buyer shall accept part of the goods so sold; and actually receive the same, or give something in E. to bind the bargain, or in part payment." The case referred to "related to the purchase of a horse, where the purchaser produced a shilling from his pocket, and drew it across the hand of the seller's servant, and then returned it to his own pocket; and it was held that this act (which is a custom in the n of England, and is called striking a bargain) was not sufficient to satisfy the requisitions of the statute."—Story, *ut sup.* From this decision it follows that no importance is attached in England to such fictitious ceremonies as the Jew plucking off his shoe and giving it to his neighbor, the Indian smoking his pipe, or the less poetical observance of thumb-licking, which Erskine tells us was common among the lower classes in Scotland in his day.

EAR-RING. A ring suspended from the ear, which is bored for the purpose. This mode of adorning the person has always enjoyed great favor amongst orientals. By Persians, Babylonians, Lydians, Libyans, and Carthaginians, ear rings were worn by both sexes. In the classical nations of antiquity, their use was confined to women. In the *Iliad* (xiv. 182, 183), Juno is represented as adorning herself with ear-rings made with three drops resembling mulberries. From this period down to the latest, the practice prevailed in Greece, and we find the ears of the Venus de Medici pierced for the reception of ear-rings. Pliny says (xi. 50) that there was no part of dress on which greater expense was lavished amongst the Romans; and Seneca mentions an ear-ring which he says was worth a patrimony. It has four pearls, two above and two below the precious stone in the center. In the more valuable of the antique ear-rings, pearls were almost always used; and they were valued for the completeness of their form as well as for their whiteness. In place of a ring, the ornament was often attached to the ear with a hook, a custom which still prevails in Italy. Many Egyptian ear-rings of very beautiful design have been preserved. These antique designs have been imitated in modern times, and if the use of an ornament which seems fitter for a South sea islander than an English gentlewoman is to be continued, it can scarcely be made to assume a more graceful form than was often given to it by the ancients. See RING. During the reigns of Elizabeth and James I., ear-rings were worn in England by men; a custom which is still continued by many sailors. Master Matthew, in *Every Man in his Humor*, says to Brainworm: "I will pawn this jewel in my ear;" and Hall, in his *Satires* (B. vi. Sat. 1), speaks of the "ringed ear" of the new-come traveler; and many similar passages to the like effect might be quoted. At the present day in England, ear-rings are worn only by women. The ears are bored usually at about 7 years of age. The boring, which produces a temporary inflammation, acts as a counter-irritant in cases of sore eyes; and this is sometimes given as a reason for putting rings in the ears.

EARS, a term in organ-building, given to small projecting pieces of metal on the sides of the mouths of metal pipes, put on for the purpose of assisting the pipes to speak promptly, especially when the organ is of small scale. The German name of "beard" is fully more appropriate.

EAR SHELL, *Haliotis*, a marine mollusk, of which the shell is used for inlaying and other ornamental purposes, and for decorating walls. They resemble the human ear in shape; are from 6 to 8 in. long, and 5 or 6 wide; are found in all temperate and tropical seas, and in some countries are used for food, being obtained at low tide in deep water, where they are found adhering to the rocks. There are about 75 living species, and a few fossils have been found.

EARTH, THE, the globe on which we live, being the third planet in order form the sun, and the largest within the belt of the planetoids. We proceed to consider briefly the points of chief interest connected with it, and which do not fall to be treated under separate heads, viz., 1. Its form and magnitude; 2. Its mass and density; 3. Its motions; 4. Its temperature.

1. *The Form and Magnitude of the Earth.*—To a spectator so placed as to have an unobstructed view all round, it appears a circular plain, on whose circumference the vault of heaven seems to rest. Accordingly, in ancient times, even philosophers looked long upon the earth as a flat disk swimming upon the water. But many appearances were soon observed to be at variance with this idea, and even in antiquity, the spherical form of the E. began to be suspected by individuals. It is only by assuming the E. to be spherical, that we can explain how our circle of vision becomes wider as our position is more elevated; and how the tops of towers, mountains, masts of ships, and the like, come first into view as we approach them. There are many other proofs that the E. is a globe. Thus, as we advance from the poles towards the equator, new stars, formerly invisible, come gradually into view; the shadow of the E. upon the moon during an eclipse is always round; the same momentary appearance in the heavens is seen at different hours of the day in different places on the E.'s surface; and lastly, the E., since 1519, has been circumnavigated innumerable times. The objection to this view that readily arises from our unthinking impressions of up and down, which immediately suggest the picture of the inhabitants of the opposite side of the E,—our *antipodes*—with their heads downwards, is easily got over by considering that on all parts of the earth's surface *down* is towards the E.'s center.

It is not, however, strictly true that the E. is a sphere; it is slightly flattened or compressed at two opposite points—the poles—as has been proved by actual measurement of degrees of latitude, and by observations of the pendulum. It is found that a degree of a meridian is not everywhere of the same length (see DEGREE OF LATITUDE), as it would be if the E. were a perfect sphere, but increases from the equator to the poles; from which it is rightly inferred that the E. is flattened there. A pendulum, again, of a given length is found to move faster when carried towards the poles, and slower when carried towards the equator, which shows that the force of gravity is less at the equator than at the poles, or, in other words, that the center, the seat of gravity, is more distant at the former than at the latter. The diminished force of gravity at the equator has, it is true, another cause, namely, the centrifugal force arising from the rotation of the E., which acts counter to gravitation, and is necessarily greatest at

the equator, and gradually lessens as we move northwards or southwards, till at the poles it is nothing. But the diminution of the force of gravity at the equator arising from the centrifugal force amounts to only $\frac{1}{289}$ of the whole force; while the diminution indicated by the pendulum is $\frac{1}{194}$. The difference, or $\frac{1}{578}$ nearly, remains assignable to the greater distance of the surface from the center at the equator than at the poles. From the most accurate measurements of degrees that have been made, the flattening or ellipticity of the E. has been determined by Bessel at $\frac{1}{299 \cdot 153}$, or $\frac{1}{300}$ nearly; or, the equatorial radius is to the polar as 300 to 299. These measurements of degrees determine not only the shape but the size of the earth. Bessel's calculations give a geographical mile, or the 60th part of a mean degree of the meridian, at 951.807 toises (2,029 yards, thus making the whole circumference 43,526,400 yards), and the equatorial and polar diameters at 6,875.6 and 6,8552.4 geographical m. (7,925.6 and 7,899.14 English imperial miles). The surface of the E. contains nearly 150 millions of square geographical miles.

2. *The Mass and Density of the Earth.*—We have now seen that the E. is a sphere slightly flattened at its poles—what is called by geometers an elliptical spheroid—of a mean radius of somewhat less than 4,000 miles. We have next to consider its mass and density. Nothing astonishes the young student more than the idea of weighing the E.; but there are several ways of doing it; and unless we could do it, we never could know its density. (1.) The first method is by observing how much the attraction of a mountain deflects a plummet from the vertical line. This being observed, if we can ascertain the actual weight of the mountain, we can calculate that of the earth. In this way, Dr. Maskelyne, in the years 1774–76, by experiments at Schihallion, in Perthshire, a large mountain mass lying e. and w., and steep on both sides—calculated the E.'s mean density to be five times greater than that of water. The observed deflection of the plummet in these experiments was between 4″ and 5″. (2.) In the method just described, there must always be uncertainty, however accurate the observations, in regard to the mass or weight of the mountain. The method known as *Cavendish's experiment* is much freer from liability to error. This experiment was first made by Henry Cavendish on the suggestion of Michel, and has since been repeated by Reich of Freyberg, and Mr. Francis Baily. In the apparatus used by Mr. Baily two small balls at the extremities of a fine rod are suspended by a wire, and their position carefully observed by the aid of a telescope. Large balls of lead placed on a turning-frame, the center of which is in the prolongation of the suspending wire, are then brought near them in such a way that they can affect them only by the force of their attraction. On the large balls being so placed, the small ones move towards them through a small space, which is carefully measured. The position of the large balls is then reversed—i.e., they are placed at the same angular distance on the other side of the small balls—and the change of position of the small balls is again observed. Many observations are made, till the exact amount of the deviation of the small balls is ascertained beyond doubt. Then by calculation the amount of attraction of the large balls to produce this deviation is easily obtained. Having reached this, the next question is, what would their attraction be if they were as large as the earth? This is easily answered, and hence, as we know the attractive force of the E., we can at once compare its mean density with that of lead. Mr. Baily's experiments lead to the result that the E.'s mean density is 5.67 times that of water. (3.) A third mode has lately been adopted by the astronomer-royal, by comparison of two invariable pendulums, one at the E.'s surface, the other at the bottom of a pit at Harton colliery, near Newcastle, 1260 ft. below the surface. The density of the E., as ascertained from this experiment, is 6 and 7 times that of water; but for various reasons this result is not to be accepted as against that of the Cavendish experiment, and it is said that the astronomer-royal was himself dissatified with it, and meant to repeat the experiment with new precautions. The density of the E. being known, its mass is easily calculated, and made a unit of mass for measuring that of the other bodies in the system. It is found that the mass of the E. compared with that of the sun is .0000028173.

3. *The Motions of the Earth.*—The E., as a member of the solar system, moves along with the other planets round the sun from w. to east. This is contrary to our sensible impressions, according to which the sun seems to move round the E.; it was not till a few centuries ago that men were able to get over this illusion. See COPERNICAN SYSTEM. This journey round the sun is performed in about 365¼ days, which we call a year (solar year). The E.'s path or orbit is not strictly a circle, but an ellipse of small eccentricity, in one of the foci of which is the sun. It follows that the E. is not equally distant from the sun at all times of the year; it is nearest, or in perihelion, at the beginning of the year, or when the northern hemisphere has winter; and at its greatest distane, or aphelion, about the middle of the year, or during the summer of the northern hemisphere. The difference of distance, however, is comparatively too small to exercise any perceptible influence on the heat derived from the sun, and the variation of the seasons has a quite different cause. The least distance of the sun from the E. is over 94 millions of miles, and the greatest over 96 millions; the mean distance is commonly stated at 95 millions of miles. If the mean distance be taken as unity, then the greatest and least are respectively represented by 1.01679, and 0.98321. It follows that the E. yearly describes a path of upwards of 596 millions of miles, so that its velocity in its orbit is about 99,000 ft., or 19 m. in a second.

Besides its annual motion round the sun, the E. has a daily motion or rotation on its axis, or shorter diameter, which is performed from w. to e., and occupies exactly 23 hours, 56 minutes, 4 seconds of mean time. On this motion depend the rising and setting of the sun, or the vicissitudes of day and night. The relative lengths of day and night depend upon the angle formed by the E.'s axis with the plane of its orbit. If the axes were perpendicular to the plane of the orbit, day and night would be equal during the whole year over all the E., and there would be no change of seasons; but the axis makes with the orbit an angle of 23½°, and the consequence of this is all that variety of seasons and of climates that we find on the E.'s surface; for it is only for a small strip (theoretically, for a mere line) lying under the equator that the days and nights are equal all the year; at all other places, this equality only occurs on the two days in each year when the sun seems to pass through the celestial equator, i.e., about the 21st of Mar., and the 23d of September. From Mar. 21, the sun departs from the equator towards the n., till, about June 21, he has reached a n. declination of 23½°, when he again approaches the equator, which he reaches about Sept. 23. He then advances southward, and about Dec. 21, has reached a s. declination of 23½°, when he turns once more towards the equator, at which he arrives, Mar. 21. The 21st of June is the longest day in the northern hemisphere, and the shortest in the southern; with the 21st of Dec., it is the reverse.

The velocity of the E.'s rotation on its axis evidently increases gradually from the poles to the equator, where it is about equal to that of a musket-ball, being at the rate of 24,840 m. a day, or about 1440 ft. in a second.

A direct proof of the rotation of the E. is furnished by its compression at the poles. There are indubitable indications that the E. was originally fluid, or at least soft; and in that condition it must have assumed the spherical shape. The only cause, then, that can be assigned for the fact that it has not done so, is its rotation on its axis. Calculation also shows that the amount of compression which the E. actually has, corresponds exactly to what its known velocity and mass must have produced. Experiments with the pendulum, too, show a decrease of the force of gravity from the poles towards the equator; and though a part of this decrease is owing to the want of perfect sphericity, the greatest part arises from the centrifugal force caused by the motion of rotation. Another direct proof of the same hypothesis may be drawn from the observation that bodies dropped from a considerable height deviate towards the e. from the vertical line. This fact has been established by the experiments of Benzenberg and others. In former times, it was believed that if the E. actually revolved in the direction of e., a stone dropped from the top of a tower would fall, not exactly at the foot of the tower, but to the w. of it. Now, as experience, it was argued, shows that this is not the case—that the stone, in fact, does fall at the bottom—we have here a proof that the pretended rotation of the E. does not take place. Even Tycho Brahé and Riccioli held this objection to the doctrine to be unanswerable. But the facts of the case were just the reverse. Newton, with his wonted clearness of vision, saw that, in consequence of the E.'s motion from w. to e., bodies descending from a height must decline from the perpendicular, not westward, but eastward; since, by their greater distance from the E.'s center, they acquire at the top a greater eastward velocity than the surface of the E. has at the bottom, and retain that velocity during their descent. He therefore proposed that more exact observations should be made to ascertain the fact; but it was not till more than a century afterwards that experiments of sufficient delicacy were made to bring out the expected result satisfactorily. It is difficult to find an elevation sufficiently great for the purpose, as several hundred feet give merely a slight deviation, which it requires great accuracy to observe. If a height of 10,000 ft. could be made available, the deviation would be not less than 7½ feet. The analogy of our E. to the other planets may also be adduced, the rotation of which, with the exception of the smallest and the most distant, is distinctly discernible. Finally, an additional proof of the E.'s rotation was lately given by Léon Foucault's striking experiment with the pendulum. The principle of the experiment is this: that a pendulum once set in motion, and swinging freely, continues to swing in the same plane, while at any place at a distance from the equator the plane of the meridian continues to change its position relative to this fixed plane.—The objection taken to the doctrine of rotation from the fact that we are unconscious of any motion, has little weight. The movement of a vessel in smooth water is not felt, though far less uniform than that of the E.; and as the atmosphere accompanies the E. in its motion, there is no feeling of cutting through it to break the illusion of rest.

If the turning of the E. on its axis is thus proved to be the cause of the apparent daily motion of the heavens, it is an easy step to consider the annual motion of the sun through the constellations of the zodiac as also apparent, and arising from a revolution of the E. about the sun in the same direction of w. to east. If we consider that the mass of the sun is about 359,000 times greater than that of the E., and that by the laws of mechanics, two bodies that revolve round each other, must revolve about their common center of gravity, the idea of the sun revolving about the E. is seen to be simply impossible. The common center of gravity of the two bodies being distant from the center of each inversely as their respective masses, is calculated to be only 267 m. from the center of the sun, and therefore far within his body, which has a diameter of

882,000 miles. But by help of a figure, it is easy to show that the apparent motion of the sun on the ecliptic naturally arises from a motion of the E. about the sun. The motions of the planets also, that appear so complicated and irregular as seen by us, can only be satisfactorily explained by assuming that they too revolve round the sun in the same direction as the earth. See PRECESSION and NUTATION for an account of a small periodic motion of the E.'s axis and its effects.

4. *The Earth's Temperature.* See METEOROLOGY and TEMPERATURE as to the phenomena of heat on the E.'s surface. As we go below the surface, we reach a depth beyond which the interior of the E. seems to have no sympathy with the external causes of heat or cold, and its heat appears to be its own, and to increase according to a fixed law the deeper we descend. The average rate of observed increase is 1° F. for a descent of between 40 and 50 feet. If this law were universal—which we do not know it to be—at a depth of less than 30 miles the heat would be such as to hold in fusion all known substances, and the E. would have to be regarded as a very thin crust or shell full of molten liquid. This theory of a molten interior obtained at one time extensive currency among philosophers, being indorsed with the names of Fourier and Humboldt; but it has since been shown to be inconsistent with the rigidity which astronomical observations prove the E. to possess. A liquid nucleus would be subject to tides like the ocean, and the crust would partake of the motion. Granting the increase of heat to be constant, we do not know what effect the increasing pressure may have in preventing fusion.

EARTH-CLOSET. See SEWAGE EARTH-CLOSET, *ante.*

EARTHENWARE. See POTTERY.

EARTH-HOUSES, EIRD-HOUSES, or YIRD-HOUSES, the name which seems to have been generally given throughout Scotland to the under-ground buildings which in some places are called also "Picts' houses" (q.v.), and in others, it would appear "weems," or caves. Martin, in his *Description of the Western Islands,* printed in 1703, when their use would appear to have been still remembered, speaks of them as "little stone-houses built under ground, called earth-houses, which served to hide a few people and their goods in time of war." The earth-house, in its simplest form, is a single, irregularly shaped chamber, from 4 to 10 ft. in width, from 20 to 60 ft. in length, and from 4 to 7 ft. in height, built of unhewn and uncemented stones, roofed by unhewn flags, and entered from near the top by a rude doorway, so low and narrow that only one man can slide down through it at a time. When the chamber is unusually wide, the side-walls converge, one stone overlapping another, until the space at the top can be spanned by stones of 4 or 5 ft. in length. In its more advanced form, the earth-house shows two or more chambers, communicating with one another by a narrow passage. There are instances in which one of the chambers has the circular shape and dome-roof to which archæologists have given the name of the "Beehive-house" (q.v.). Occasionally, as many as forty or fifty earth-houses are found in the same spot, as in the moor of Clova, not far from Kildrummy, in Aberdeenshire. They appear to have been almost invariably built in dry places, such as gravelly knolls, steep banks of rivers, and hill-sides. They are generally so near the surface of the ground that the plow strikes upon the flagstones of the roof, and thus leads to their discovery. The object most frequently found in them is a stone quern, or hand-mill, not differing from that which continued to be used in remote corners of Scotland within the memory of living men. Along with the quern are generally found ashes, bones, and deer's horns; and more rarely small round plates of stone or slate, earthen vessels, cups and implements of bone, stone celts, bronze swords, gold rings, and the like. Occasionally the surface of the ground beside the earth-house shows vestiges of what are supposed to have been rude dwelling-houses, and folds or inclosures for cattle. This, with other things, would indicate that the earth-houses of Scotland and Ireland (for they are found also in that island) were put to the same purpose as the caves which, as Tacitus (writing in the 2d c.) tells us, the Germans of his day dug in the earth, as storehouses for their corn, and as places of retreat for themselves during winter or in time of war.

EARTH-NUT, a popular name for the tubers of certain umbelliferous plants, particularly *bunium bulbocastanum* and *B. flexuosum,* which are common in most parts of Europe. Names of the same signification are given to them in a number of European languages. *Arnut, yernut,* and *jurnut,* Scotch and English provincial names, are corruptions of earth-nut. PIG-NUT is another common English name, pigs being very fond of these tubers, grubbing up the ground in quest of them, and soon becoming fat upon them. They are also called *earth-chestnut,* from their resemblance in taste and qualities to chestnuts, perhaps also from their resemblance in size, and their being black or very dark brown externally, and white within. By some they are preferred to chestnuts, and they are much used for food in different parts of Europe, and occasionally in some parts of England, either roasted or in soups. They are wholesome and nutritious; they form an article of trade in Sweden, and have sometimes been recommended as worthy of an attention which they have never yet received in Britain. The two species are very similar in general appearance, although *B. bulbocastanum* has by some botanists been referred to the genus *carum* (caraway), because its carpels have single vittæ between the ribs, whilst *B. flexuosum* has three. The former is also a plant of stouter habit.

Both have umbels of small white flowers, much divided leaves with very narrow segments, and a single roundish tuber at the foot of each plant. *B. flexuosum* is common in woods, pastures, waysides, etc., in most parts of Britain. *B. bulbocastanum* is found only in some of the chalk districts of England, but is abundant in many parts of Europe. *B. ferulaceum* likewise affords tubers, which are used as food in Greece.—The somewhat similar tubers of another umbelliferous plant, *oenanthe pimpinelloides*, which grows in the pastures of some parts of the s. of England, are sometimes also used for food, notwithstanding the very poisonous qualities of some of its congeners. See WATER-DROPWORT.—A Himalayan umbelliferous plant (*chærophyllum tuberosum*), a species of chervil (q.v.), yields edible tubers or *earth-nuts*.—The name earth-nut is sometimes extended to other small tuberous roots of similar quality, although produced by plants widely remote in the botanical system, as *apios tuberosa* and *lathyrus tuberosus*. See APIOS and LATHYRUS.

EARTHQUAKE, the term applied to any tremor or shaking of the solid crust of the earth. The frequent occurrence of earthquakes, their destruction to life and property, their influence upon the solid surface of the earth, and the mysteriousness of their cause, force them upon our attention. It is estimated that 12 or 13 earthquakes, destructive more or less of life and property, occur every year, and it is well known that the surface of the globe is never free from sensible evidence of the continued operation of E. agency—that in some quarter or another tremors or slight shakings are always taking place. When these are of a serious nature, whole cities have been destroyed; fertile districts, with all their fruits and grain, have been laid waste; and enormous masses of human beings have lost their lives. No less than 60,000 perished in the great Lisbon E.; while in that of Calabria, in the end of last century, 40,000 were destroyed. It is estimated that as many as 13,000,000 of the human race have thus perished! The great changes which earthquakes produce on the earth's surface deserve the careful attention of the geologist. They disclose to him an agency which seems to have been at work during every period of the earth's history, and which has altered the earth's surface to an extent that can scarcely be imagined. The observed results of earthquakes which more immediately demand his attention are such as these: the new lakes and river-courses which they form, at the same time obliterating the old ones; the new valleys which they hollow out; the fissures of various sizes they form; and the immense landslips they frequently produce. But the mysterious nature of the producing cause of earthquakes is also a strong incentive to their study. It is unfortunately true, that the most popular scientific inquiries are those in which the imagination has large play: dry inductions from observed phenomena are not suited to the genius of popular modern science. Consequently, earthquakes, where every attempt at explaining their origin is theoretical, from the impossibility of obtaining direct observation, affording as they do a wide field for the play of the poetic faculty, find plenty of students.

No portion of the earth's surface is exempt from the influence of earthquakes. Egypt has been less visited than perhaps any other country, but even here we have the record of one which took place in 1740 A.D.; and Holland, with its loose alluvial deposits, has also felt their power. Nor is the bed of the ocean exempt; records of many subaqueous earthquakes exist, taken by vessels at sea, sometimes passing over the point of greatest disturbance at the moment of the shock. In like manner earthquakes have been active at every period of the earth's existence, breaking up its solid crust, elevating or depressing its surface, and doing as much as any other single agent to bring it into its present condition. They have been probably at some periods more active than at others, just as we find that some districts are now more liable than others to their visitation. So well defined, indeed, are the localities where earthquakes occur, that it is easy to exhibit their limits on a map. They are most frequent around the present lines or centers of volcanic action (see VOLCANO); and their frequency and violence seem to bear some relation to the activity and intensity of the associated volcanoes. Observers of volcanic phenomena have noticed that every great eruption, in whatever part of the world observed, and whether from a volcanic vent on land or beneath the ocean, is accompanied by E. shocks of greater or less violence and duration; while, on the other hand, those observing eaathquakes speak of them as accompanied by volcanic eruptions, and of their often being stopped on the opening of volcanic vents. It is, however, an important fact that, although regions of active volcanic action are those of most frequent E. movements, yet the most violent earthquakes do not appear to have occurred in these regions, but, on the contrary, in districts lying some degrees away from the nearest volcanic action, as, for instance, in the famous E. of Lisbon. Districts in which there are extinct volcanoes are not more liable to such visitations than non-volcanic regions.

The phenomena connected with earthquakes have been variously described. Many writers refer to appearances in the heavens, or changes in the atmosphere, which to them seem to have some connection with the catastrophes they narrate. They tell of irregularities in the season preceding or following the shock, of sudden gusts of wind interrupted by sudden calms, of violent rains at unusual seasons, or in countries where such phenomena are almost unknown, of a reddening of the sun's disk, of a haziness

in the air often continued for months, and similar phenomena. But these are so irregular in their appearance, and have been so seldom observed associated with more than a single E., that, in the absence of any decided reason to the contrary, there seem good grounds for believing they have no real connection with the earthquake. It is different with underground noises, which frequently precede, accompany, or succeed the occurrence of earthquakes, or some of the shocks of them. They are undoubtedly intimately connected with the shock, yet earthquakes occur, even of the greatest violence, which are unaccompanied by any sound whatever. Different descriptions have been given of these subterranean noises. In some earthquakes, they are likened to chains pulled about, increasing to thunder; in others, the sound is like the rumbling of carriages, growing gradually louder, until it equals the loudest artillery; or like heavy wagons running away upon a road; or distant thunder; or like the hissing produced by the quenching of masses of red-hot iron in water; or like the rush of wind underground. As there have been earthquakes without subterranean noises, so there are frequently, in South America and elsewhere, underground sounds which are not followed by earthquakes.

The more intimate earthquake-phenomena are more uniform. Sometimes there is nothing else felt than a trembling or gentle motion of the surface, without producing any injury. In severe earthquakes, the almost invariable succession of phenomena is first a trembling, then a severe shock, or a succession of shocks, and then a trembling, gradually becoming insensible. The violent shocks are instantaneous, and very few in number, sometimes only one, usually not more than three or four. In the intervals between these, smaller shocks or tremblings take place. The severe shocks do the mischief. At the point or line of greatest disturbance, the shock has a distinctly vertical direction, coming from below upwards. As we leave this point, the direction of the motion becomes more and more horizontal, gradually also decreasing in intensity until it becomes insensible. This progressive movement is produced by an earth-wave or true undulation of the solid crust of the earth. The whole mass of the area is not moved at once, but only the wave-crest. In the case of the earthquake at Lisbon, the progress of the wave was roughly calculated; it was shown to have had a very great velocity, and to have lasted only for an instant at any one spot. The area affected on this occasion was very extensive. The shock was felt on the one side as far as the southern shores of Finland, and on the other it reached beyond the St. Lawrence in Canada, and was observed in some of the West India islands—an area of no less than 7,500,000 sq. miles. The force required to move this must have been enormous, for, suppose the thickness of the earth's crust moved to have been no more than 20 m., then 150,000,000 cubic m. of solid matter was moved. The influence of this earth-wave is communicated to the sea, when the E. is near the shore, or on the bed of the ocean. The sea swells, and slightly retires from the beach, and then a great wave rolls in upon the shore. At the Lisbon E., this wave rose to a height of 60 ft. at Cadiz. It carries with it sea-spoil, scattering it over the surface of the earth, far beyond the ordinary reach of the sea.

Of the various theories as to the nature of earthquakes, we can only refer to the most important. All theorists are agreed as to the connection between volcanoes and earthquakes; that they are produced by the same subterranean agency. The existence of molten matter in the interior of the earth, is the starting-point in all except the chemical theory propounded by Davy, which, though in the end abandoned by him, still finds supporters. When he discovered the metallic bases of the earths and alkalies, he threw out the idea that those metals might abound in an unoxidized state in the subterranean regions, to which water must occasionally penetrate. When this occurred, gaseous matter would be set free, sufficient to produce the E., the metals would combine with the oxygen of the water, and heat enough would be evolved to melt the surrounding rocks.

Mr. Mallet, in an elaborate report on the subject presented to the British association, proposed an ingenious theory. He assumes that volcanoes, and the centers of E. disturbances, are near the sea, or other large supplies of water; and he says that when an irruption of igneous matter takes place beneath the sea-bottom, the first action must be to open up large fissures in its rocky material, or to lift and remove its incoherent portions, such as sand, mud, gravel, etc. The water on meeting the heated surfaces assumes the spheroidal state; while in this condition, the intestine motion may be great, but little steam is generated; but no sooner have the surfaces cooled, than the water comes into close contact with them, and a vast volume of steam is evolved explosively, and blown off into the deep and cold water of the sea, where it is condensed, and thus a blow of the most tremendous sort is given at the volcanic focus, and being transferred outwardly in all directions, is transmitted as the E. shock. The surfaces of the ignited material, however, now cooled down below the point at which steam can be generated rapidly, merely keep up a gentle ebullition, which is transmitted as the trembling after the shock. On the surfaces again becoming heated by conduction from the molten mass, the various phases are again repeated. This he considers the chief cause of earthquakes, but he supposes they may also be due to the evolution of steam through fissures, and its irregular and *per saltum* condensation under pressure of sea-water; or to great fractures and dislocations in the rocky crust, suddenly produced by pressure acting on it from beneath, or in any other direction.

The old assumption that the earth consists of a molten fluid core with a cooled and hardened rind floating upon it, is inconsistent with the rigidity that astronomers have proved the earth to possess. But although the earth must be mainly solid, it is yet believed to be of a honey-combed structure, and that the cavities contain in many places lakes of molten rock, between which and the surface volcanoes are orifices of communication. Into these cavities, water sinking down through crevices from the ocean or the land must be constantly finding its way; and the steam thus generated exerts such enormous pressure as to force the molten matter to the surface, itself mingling and escaping along with it. When a mass of water is suddenly precipitated into a hot cavern, the explosion of steam will cause an earthquake concussion, and where there is no vent, may be sufficient to convulse and rend the superincumbent strata.

EARTHS, in chemistry, are a class of substances regarded by the alchemists and older chemists as elementary, and which are insoluble in water. The earths *proper* are now known to be compound, consisting of a metal in combination with oxygen. The list includes alumina, glucina, zirconia, thoria, didymia, lantana, ceria, yttria, terbia, erbia. They do not alter vegetable colors, are soluble in acids, and are precipitated from their solutions by ammonia, potash, or soda. The *Alkaline Earths* have already been noticed. See ALKALIES.

EARTH-SHINE, the reflection from the moon of the light cast upon her by the earth, particularly noticeable in clear nights at the time of new moon, when sometimes the whole surface of the moon can be seen in ashy colored light. The earth serves the same purpose to the moon that the moon does to the earth; that is, the earth is the moon's moon, and would present to an observer on the moon the same phases that the moon does to us; but the earth would, to an observer from the moon, appear four times as large as the moon does to us. When it is new moon to us, it is full moon to an observer on the side of the moon facing the earth, and, as the earth is much the larger, it gives to the moon about 16 times as much light as the full moon gives to us. This light, reflected back to us, is known as earth-shine. It is really the light of the sun reflected by the earth to the moon, and by the moon back to the earth.

EARTHWORKS, in fortification, is a general name for all military constructions, whether for attack or defense, in which the material employed is chiefly earth. The word *earthwork*, however, has lately received a new importance, in reference to a discussion among military engineers, whether earthwork defenses generally are better or worse than those of masonry. The subject cannot be discussed here, but its general character may be indicated. The fracture of the Russian granite fortifications at Bomarsund, and the obstinate defense made within the earthen defenses at Sebastopol, led many writers, about the year 1855, to express a preference for earthworks instead of stoneworks. Mr. J. Fergusson (*Portsmouth Protected*, 1856) has especially distinguished himself by his advocacy of this view. The reasons urged are—that masses of earth can be more quickly and cheaply put up than masses of masonry; that in most places earth is more readily obtained than stone; that if an earthwork be knocked to ruin by balls and shells, it can be repaired in a very short time; and that the defenders are not exposed to so much injury as in masonry-works, where splinters of stone fly about in a perilous way. The late sir John Burgoyne, the leading military engineer in England of his day, combated these views. He contended, among other things, that as a given amount of cannonading will make a much larger breach in earthwork than in stonework, the latter is best fitted to prevent capture by assault. He insisted that earthworks should be regarded rather as temporary expedients than as purposed and permanent constructions; and he claimed the authority of continental engineers in support of this opinion. See further under FORTIFICATION.

EARTHWORM, *Lumbricus*, a genus of *annelida* (q.v.), of the order *terricolæ*. There are many species, all of them pretty closely resembling in characters and habits the common E. or dew-worm (*L. terrestris*), which is everywhere plentiful in Britain and throughout Europe, and is familiar to everybody. It has no head distinct from the body, no eyes, no antennæ, nor any organs external to the rings of which its body is composed, except minute bristles pointing backwards, of which each ring bears four pair, and which are of use in its locomotion. It sometimes attains to nearly a foot in length, and more than 120 rings have been counted in its body. The end at which the mouth is situated is pointed, and the tail is flattened, whilst the general form is cylindrical. The mouth consists merely of two lips, the upper lip elongated; there are no teeth nor tentacles, and the worm subsists by swallowing fine particles of the soil, from which its digestive organs extract the digestible matter, the rest being voided often in little intestine shaped heaps, called *worm-casts*, on the surface of the ground. The locomotion of the E. is effected by means of two sets of muscles, which enable it to contract and dilate its rings; its bristles preventing motion backwards, and the whole muscular effort thus resulting in progress; whilst the expansion of the rings, as it contracts the anterior segments, and draws forward the hinder parts, widens a passage for it through earth whose particles were close together before. Earthworms are thus of very great use, their multitudes continually stirring and loosening the soil through which they work their way; and moles, pursuing them to feed on them, stir and loosen it still more; whilst worm-casts gradually accumulate on the surface to form a layer of the

very finest soil, to which it is supposed that the best old pastures in a great measure owe their high value.

Earthworms do not often visit the surface of the ground, except during night, and when the ground is moist. In the evening, during or after rain, or in the morning, when the dew is abundant, they may sometimes be seen traveling about in great numbers. Both drought and cold cause them to retreat more deeply into the earth.—Their respiration is effected by means of little sacs, which communicate by minute pores with the external air. They are hermaphrodite, but mutual fecundation takes place by means of the thickened knot (*clitellum*) which is situated before the middle of their body. Their eggs often contain two embryos, and the young worms escape by a sort of valvular opening at the end.

Besides their usefulness in the improvement of the soil, earthworms are of importance as food for birds, fishes, etc. Their value as bait for fishes is well known to every angler. The instinct which prompts them to hasten to the surface, when, in quest of bait, the angler shakes the soil with a spade or fork, is probably to be referred to the similar shaking on the approach of their constant enemy, the mole.

An E. of great size is common in the East Indies, wherever the climate is moist, from the Himalaya to Ceylon and Java. It is *ichthyophis glutinosus*, and abounds very much in that viscid secretion which in the common E. also forms a kind of protecting sheath for the animal, and smooths its way.

EAR-TRUMPET, a contrivance for improving the hearing of the partially deaf. For this purpose many ingenious instruments have been devised. The principle in them all is the same: to collect the sonorous vibrations, and to convey them in an intensified form to the deeper parts of the ear. In this way the hand placed behind the external ear constitutes the simplest form of ear-trumpet. Though, in a great number of cases of impaired hearing, there can be no doubt that much assistance and comfort are obtained from the use of one or other of the varieties of the ear-trumpet, still they must not be used indiscriminately, for in unsuitable cases they often do much mischief, both by increasing the deafness, and aggravating the noises in the head from which deaf persons often suffer so much. They are of most use, perhaps, in advanced cases of nervous deafness, though injurious in the early stages of this complaint; they are hurtful also in all acute diseases of the organ, and of little or no use in those cases of great thickening of the contents of the middle ear, where the adapting power of the organ has been lost. There are many varieties of trumpet in common use. By far the most useful and comfortable are those which are worn on the head, which go by the name of ear-cornets or acoustic-auricles. They can be concealed under the hair or cap, and may be adapted to one or both ears by means of a spring over the head. The apparatus most commonly in use requires to be held in the hand, and consists of a narrow portion inserted into the ear-passage, and which gradually expands into a wide mouth; or the extremity of the instrument may be turned downwards, as in that form which passes by the name of Miss Martineau's trumpet. Another variety, applicable to the more severe cases of deafness, consists of an elastic tube, one end of which is tipped with ivory, and is placed in the ear of the patient; the other is held in the hand of the speaker, who applies his mouth to the open extremity. With this instrument only one voice can be heard at a time. With the first-mentioned variety, general conversation can be heard often quite well. Ear-trumpets are generally made of some thin metallic substance, such as tin. Gutta-percha, vulcanite, and other substances, are also frequently used.

EARWIG, *Forficula*, a genus of orthopterous insects, recently subdivided into a number of genera, and forming the family *forficulidæ*, which many entomologists constitute into a distinct order, *dermaptera* (Gr. leather-winged). These insects indeed connect the true *orthoptera* with the *coleoptera*. Their legs are formed for running, and not for leaping; their wing-covers (*elytra*)—which are very small, and hide only a small part of the abdomen—are of firmer substance than in the other *orthoptera;* the wings, of which there are two sets—hind and fore wings—are curiously folded under them, both longitudinally, in a fan-like manner, and transversely; the organs of the mouth resemble those of the true *orthoptera*, with which also earwigs agree in the important character of *semi-complete* metamorphosis; the larvæ and pupæ much resembling the perfect insect, running about and feeding in the same manner, but the larvæ being destitute of wings and wing-covers, the pupæ having them only in a rudimentary state. Earwigs have the body narrow, and of nearly equal breadth throughout, the head exposed, the mandibles very strong and horny, the antennæ long and thread-shaped. The abdomen bears at its extremity a large pair of forceps, apparently of use as an instrument of defence. Earwigs abound in moist situations, as under the decayed bark of trees, under stones, among decaying straw, etc. They feed both on animal and vegetable food; the COMMON E. (*F. auricularia*), very abundant in Britain and in most parts of Europe, is troublesome to gardeners by eating the leaves of plants and the petals of fine flowers; but the injury which it does is probably more than compensated, particularly as to field-crops, by the destruction of multitudes of smaller insects, as *thrips, aphis*, etc. The appearance of this insect is by no means agreeable, and its mandibles and forceps are suggestive of unpleasant possibilities, which, however, would seem never to be realized, although it is a very frequent visitor of houses, particularly those of which the

walls are covered with foliage. It is curious how extensively prevalent the notion is that earwigs creep into the ear. To this they owe their English name (E. from *ear*, and Sax. *wicga*, a worm or grub), and their names in many languages, as the French *perceoreille*, the German *Ohrwurm*, etc. Newman, in his *Introduction to the History of Insects*, says: "The shape of these wings (the hind ones), when fully opened, is nearly that of the human ear; and from this circumstance it seems highly probable that the original name of this insect was ear*wing*." It is agreeable to the general habits of the E. to creep into holes, yet there is apparently no authenticated instance of an E. entering the ear of a human being. Of their habit of creeping into holes, particularly to hide during the day, gardeners take advantage to make earwig traps of different descriptions.

An interesting peculiarity in the habits of these insects remains to be noticed. The female E. sits upon her eggs and hatches them like a hen; she also gathers her young ones around her and under her in the most affectionate manner. The observations of De Geer on this point have been confirmed by Mr. Spence and others.

EAS'DALE, a small isle on the w. coast of Argyleshire, in the firth of Lorn, 10 m. s.s.w. of Oban. It contains 1¼ sq.m., and is situated in Kilbrandon parish. It is noted for its primary or metamorphic slate-quarries, belonging to the marquis of Breadalbane, which have been wrought for more than 150 years, and supply 4 or 5 millions of slates yearly. Compact feldspar and conglomerate also occur in the isle.

EASEL. This structure, the object of which is to support the canvas or panel of the artist at a convenient height for work, has been used for ages pretty much in its present form.

EASEMENT, in English law, has been defined to be "a privilege without profit, which the owner of one neighboring tenement hath of another, existing in respect of their several tenements, by which the servient owner is obliged 'to suffer or not to do' something on his own land for the advantage of a dominant owner."—Gale on *Easements*. The rights comprehended under the title of easements are of a very important kind; they include rights of water, rights of way, rights to light and air, rights to support from a neighboring soil or house, rights to carry on an offensive trade, etc. An E. is an incorporeal hereditament (q.v.), and corresponds in many respects with a servitude (q.v.) in Scotch law. But an E. is more limited than a servitude, inasmuch as it comprehends those rights only which carry no title to the profit of the soil. These latter rights are in England known as profits *a prendre* (q.v.). An E. cannot exist apart from an estate in land, it being necessary that there should be two tenements, the one enjoying the right (dominant), the other over which it is enjoyed (servient). An E. must be constituted by deed or by prescription (q.v.). It may be extinguished by an actual or implied release. When a party entitled to the enjoyment of an E. is disturbed in that enjoyment, he may enforce his right by action at law, or he may enter upon the servient tenement, and abate the nuisance himself. The American law on the subject of E. is regulated by the same principles that prevail in England. See Kent's *Commentaries on American Law*.

EASEMENT (*ante*), a legal term signifying some right of the public, or of an individual, in lands owned by another; a right existing either at common law or by statute; such, for example, as the right of way across another's estate, or to receive water from, or discharge it across, such estate. The E. is either affirmative or negative; affirmative when the owner of an estate is entitled to do something on the estate of another; negative when he is forbidden to do something, otherwise lawful, on his own premises. It may arise from the nature of things, or from special contract, express or implied. It is an E. when the owner of land makes a grant thereof for public use, as for a road or park, whereby the public gains only a right of use for the purpose specified, the title still remaining with the grantor. An E. in the land of another may also be acquired by prescription—that is, by the continuous and open enjoyment of a privilege without objection for a certain term of years. Easements may be extinguished by release or abandonment, or by a union of the two estates in the same person.

EAST (Ger. *Ost;* allied probably to Greek *eōs*, the morning, and Lat. *oriens*, the rising, i.e., sun) is, vaguely speaking, that quarter of the horizon where the sun rises, or which a person with his face to the s. has on his left hand. It is only at the equinoxes that the sun rises exactly in the e. point. A line at right angles to the meridian of a place points exactly e. and west. See MERIDIAN and HORIZON.

From very early times, the e. has been invested with a certain sacred character, or at least held in respect over other points of the compass. It was the practice of the ancient pagans to fix their altar in the eastern part of their temples, so that they might sacrifice towards the rising sun, which in itself was an object of worship. The custom of venerating the e. was perpetuated by the early Christian church from various circumstances mentioned in the sacred record. For example: "The glory of the God of Israel came from the way of the east."—Ezek. xliii. 2. "There came wise men from the east to Jerusalem."—Matt. ii. 1. "And, lo, the star, which they saw in the east, went before them."—Matt. ii. 9. Tradition heightened respect for the east. It was said that Christ had been placed in the tomb with his feet towards the e., and that at

the day of judgment he should come from the eastward in the heavens. Looking towards the sun in the e. in praying or repeating the creed, was thought to put worshipers in remembrance that Christ is the son of righteousness, and such an attitude was accordingly adopted as an aid to devotion. From these various circumstances, the building of churches with the chancel (q.v.) to the e., bowing to the e. on uttering the name of Jesus, and burying with the feet to the e., were introduced as customs in the church. In recent times there has been a general disregard to the practice of turning formally with the face to the e. on repeating the creed, and, as is well known, the attempt to revive it by a party in the English church has caused considerable dispeace. It is a curious instance of the inveteracy of popular custom, that in Scotland, where everything that savored of ancient usage was set aside as popish by the reformers, the practice of burying with the feet to the e. was maintained in the old churchyards, nor is it uncommon still to set down churches with a scrupulous regard to e. and west. In modern cemeteries in England and Scotland, no attention appears to be paid to the old punctilio of interring with the feet to the e., the nature of the ground alone being considered in the disposition of graves.

EAST ABINGTON, a village in Plymouth co., Mass., 20 m. s.e. of Boston, on the Old Colony railroad; pop. 4,600. The principal business is the manufacture of boots and shoes.

EAST BATON ROUGE, a parish in s.e. Louisiana, between the Mississippi and Amite rivers, 450 sq.m.; pop. '70, 17,816—11,343 colored; in '80, 20,016. Surface, generally level, with fertile soil, producing corn, cotton, sugar, molasses, etc. Seat of justice, Baton Rouge.

EAST BIRMINGHAM, Penn. See PITTSBURG.

EASTBOURNE, a rising watering-place in the s.e. of Sussex. It lies in a chasm between two cliffs, one of which, 3 m. to the s.s.e., forms Beachy head. In the vicinity are fine drives and walks. It has a martello tower and a fort. Pop. of parish '71, 10,361. E. is supposed to have been of Roman origin, and remains of a Roman villa, bath, and tesselated pavements have been found here.

EAST BRIDGEWATER, a t. in Plymouth co., Mass., 25 m. s.e. of Boston, on the Old Colony and Newport railroad; pop. '70, 3,017. There is abundant water power, and manufacturing is the leading business.

EASTBURN, JAMES WALLIS, 1797–1819; b. England; came to America when a child; graduated at Columbia college in 1816, and studied theology with the purpose of taking orders in the Episcopal church. While a student he began a new metrical version of the Psalms. He was joint author with Robert C. Sands of *Yamoyden*, a romance founded upon the life of Philip, the Narragansett king; and he wrote many small poems. In 1818, he was ordained and took charge of a church in Virginia, but died while on a voyage to the West Indies for his health.

EASTBURN, MANTON, D.D., 1801–72; b. England; brother of James Wallis; came to the United States when a child; graduated at Columbia college, 1817; studied in the Episcopal theological seminary, and was ordained to the ministry, 1825. He was for several years rector of the church of the Ascension, New York, and in 1843 became bishop of Massachusetts. He published *Lectures on Hebrew, Latin, and English Poetry; Essays and Dissertations on Biblical Literature; Lectures on the Epistle to the Philippians;* and many sermons and addresses. He gave the most of his property to religious and benevolent institutions.

EAST CAPE, the name of the most easterly headlands of the island of Madagascar, of the North island of New Zealand, and of Siberia or Asiatic Russia. The *first* is in lat. 15° 20′ s., and long. 50° 15′ e.; the *second* in lat. 37° 40′ s., and long. 178° 40′ e., being almost precisely the antipodes of Carthagena in Spain; and the *third* is that extremity of the old world which is nearest to the new, being separated by Behring's strait (q.v.) from cape Prince of Wales in America. It is in lat. 66° 6′ n., and long. 169° 38′ w.; or rather, to follow the natural reckoning, 190° 22′ east.

EASTER (Ger. *ostern*, Fr. *paque*, Scot. *pasch*, from Gr. *pascha*, the passover), the festival of the resurrection of Jesus Christ, derives probably its Teutonic name from the festival of the goddess Ostara, in Ang.-Sax. Eastre, which the Saxons of old were wont to celebrate about the same season at which the Christian festival of E. occurs. In the ancient church, the celebration of E. lasted 8 days. After the 11th c., however, it was limited to 3, and in later times, generally to 2 days. It was formerly the favorite time for performing the rite of baptism. The courts of justice were closed, and alms dispensed to the poor and needy, who were even feasted in the churches—a custom which led to much disorder. Slaves also received their freedom at that season; and as the austerities of Lent were over, the people gave themselves up to enjoyment; hence the day was called the "Sunday of joy" (*Dominica gaudii*). To the popular sports and dances were added farcical exhibitions, in which even the clergy joined in some places, reciting from the pulpit stories and legends, with a view to stir the hearers to laughter (*risus paschalis*). Against this indecency, the reformers of the 16th c. loudly and successfully raised their voices. During the whole week before E.—that is, in the inter-

val between Palm Sunday and the beginning of the E. festival—daily services were held. See PASSION WEEK and GOOD FRIDAY.

On E. day, the people saluted each other with the E. kiss, and the exclamation *Surrexit* (He is risen); to which the reply was *Vere surrexit* (He is risen indeed). The chief solemnity always consisted of the celebration of the Lord's supper.

The proper time for the celebration of E. has occasioned no little controversy. In the 2d c., a dispute arose on this point between the eastern and western churches. The great mass of the eastern Christians celebrated E. on the 14th day of the first Jewish month or moon, considering it to be equivalent to the Jewish Passover. The western churches celebrated it on the Sunday after the 14th day, holding that it was the commemoration of the resurrection of Jesus. The council of Nice (325 A.D.) decided in favor of the western usage, branding the eastern usage with the name of the "quartadeciman" heresy. This, however, only settled the point that E. was to be held, not upon a certain day of the month or moon, but on a Sunday. The proper astronomical cycle for calculating the occurrence of the E. moon was not determined by this council. It appears, however, that the metonic cycle (q.v.) was already in use in the west for this purpose; and it was on this cycle that the Gregorian calendar, introduced in 1582, was arranged. The method on which this calendar is constructed is too complex for description here. An elaborate account of the whole matter was published by prof. De Morgan in the *Companion to the British Almanac* in 1845, and to this the reader is referred. The time of E. being the most ancient and important of all the movable feasts of the Christian church, determines all the rest. It was debated, at the time of the introduction of the Gregorian calendar, whether E. should continue to be movable, or whether a fixed Sunday, after the 21st of Mar., should not be adopted. It was deference to ancient custom that led the ecclesiastical authorities to adhere to the method of determination by the moon. It must be remembered, however, that it is not the actual moon in the heavens, nor even the mean moon of astronomers, that regulates the time of E., but an altogether imaginary moon, whose periods are so contrived that the new (calendar) moon always follows the real new moon (sometimes by 2, or even 3 days). The effect of this is, that the 14th of the calendar moon—which had, from the times of Moses, been considered "full moon" for ecclesiastical purposes—falls generally on the 15th or 16th of the real moon, and thus after the real full moon, which is generally on the 14th or 15th day. With this explanation, then, of what is meant by "full moon," viz., that it is the 14th day of the calendar moon, the rule is that E. day is always the first Sunday after the paschal full moon, i.e., the full moon which happens upon or next after the 21st of Mar. (the beginning of the ecclesiastical year); and if the full moon happens upon a Sunday, E. day is the Sunday after. For any given year, the day on which the paschal full moon falls, and then E. day, are found by the following table and rule:

Days of the Month.	Dominical Letter.	Golden Number	Days of the Month.	Dominical Letter.	Golden Number.
March 21	C	14	April 8	G	..
" 22	D	3	" 9	A	15
" 23	E	..	" 10	B	4
" 24	F	11	" 11	C	..
" 25	G	..	" 12	D	12
" 26	A	19	" 13	E	1
" 27	B	8	" 14	F	..
" 28	C	..	" 15	G	9
" 29	D	16	" 16	A	..
" 30	E	5	" 17	B	17
" 31	F	..	" 18	C	6
April 1	G	13	" 19	D	..
" 2	A	2	" 20	E	..
" 3	B	..	" 21	F	..
" 4	C	10	" 22	G	..
" 5	D	..	" 23	A	..
" 6	E	18	" 24	B	..
" 7	F	7	" 25	C	..

First ascertain the dominical letter (q.v.)—taking the second where there are two—and the golden number (see EPACT); look for the golden number in the third column of the table, and opposite to it stands the day of the full moon; then look for the dominical letter, next after the day of full moon, and the day standing opposite the dominical letter is E. day. It sometimes happens that E. day, as thus determined, is different from what it would be if by "full moon" were understood the astronomical full moon. Thus, in 1818, E. day, by the calendar, fell, and was celebrated on the 22d of Mar., the earliest possible day, although the full moon was on that day; and in 1845, it again fell on the day of the actual full moon (the 23d of Mar.).

One object in arranging the calendar moon was, that E. might never fall on the same day as the Jewish Passover. They did occur together, however, in 1805, on the 14th of April; and in 1825, on the 3d April; and will do so again in 1903, on the 12th April;

in 1923, on the 1st April; in 1927, on the 17th April; and in 1981, on the 19th April. The Jewish festival usually occurs in Passion week, and never before the 26th of Mar., or after the 25th of April (new style). On the other hand, the Christian festival is never before the 22d of Mar., or after the 25th of April. In 1761 and 1818, E. fell on the 22d of Mar.; but neither in this nor the following century will such be the case again. In 1913, it will fall on the 23d of Mar., as it did in 1845 and 1856. The latest Easters in this century and the following, occur in 1886 and 1943, on the 25th of April. In 1848, E. fell on the 23d of, and in 1859, on the 24th of April.

Popular Observances.—Many of the popular observances connected with E. are clearly of pagan origin. The goddess Ostara or Eastre seems to have been the personification of the morning or east (q.v.), and also of the opening year or spring. The Anglo-Saxon name of April was Estormonath; and it is still known in Germany as Ostermonath. The worship of this being seems to have struck deep root in northern Germany, and was brought into England by the Saxons. It continued to be celebrated in many parts in the n. of Germany down to the beginning of the present century, by the kindling of bonfires and numerous other rites. See BELTEIN. Like the May observances of England, it was especially a festival of joy. With her usual policy, the church endeavored to give a Christian significance to such of the the rites as could not be rooted out; and in this case, the conversion was particularly easy. Joy at the rising of the natural sun, and at the awaking of nature from the death of winter, became joy at the rising of the Sun of Righteousness—at the resurrection of Christ from the grave. The bonfires can be traced in the great "paschal tapers," sometimes weighing 300 lbs., with which the churches were lighted on E. eve. In the ancient church disbursements of St. Mary-at-Hill, in the city of London, there is even an entry "For a quarter of coles for the hallowed fire on Easter eve, 6*d*."

The most characteristic E. rite, and the one most widely diffused, is the use of *Pasch* (i.e., Easter) *eggs*. They are usually stained of various colors with dye-woods or herbs, and people mutually make presents of them; sometimes they are kept as amulets, sometimes eaten; games are also played by striking them against one another. In some moorland parts of Scotland, it used to be the custom for young people to go out early on "Pasch Sunday" and search for wild-fowls' eggs for breakfast, and it was thought lucky to find them. There can be little doubt that the use of eggs at this season was originally symbolical of the revivification of nature—the springing forth of life in spring. The practice is not confined to Christians; the Jews used eggs in the feast of the Passover; and we are told that the Persians, when they keep the festival of the solar new year (in Mar.), mutually present each other with colored eggs.

From the Christian point of view, this "feast of eggs" has been usually considered as emblematic of the resurrection and of a future life.

EASTER (*ante*). The following are the dates for the occurrence of E. in each year from 1880 to the end of this century:

1880, March 28.	1885, April 5.	1889, April 21.	1893, April 2.	1897, April 18.
1881, April 17.	1886, April 25.	1890, April 6.	1894, March 25.	1898, April 10.
1882, April 9.	1887, April 10.	1891, March 29.	1895, April 14.	1899, April 2.
1883, March 25.	1888, April 1.	1892, April 17.	1896, April 5.	1900, April 15.
1884, April 13.				

Other principal days of observance may be found by reckoning from Easter. The first day of Lent (Ash Wednesday) is Wednesday in the 7th week before Easter. The Crucifixion day (Good Friday) is the Friday before Easter. The Ascension day is Thursday, the 40th day after Easter. The Pentecost day (Whitsunday) is the 50th day after E., or the Lord's day 7th after Easter.

EASTER ISLAND, originally DAVIS'S LAND, is a detached spot on the Pacific, in lat. 27° 20′ s., and long. 109° 30′ west. It is of volcanic origin, rising 1200 ft. above the sea; and it is moderately fertile, but almost destitute of water. It belongs to the Polynesian archipelago, of which it forms the south-easterly extremity. On this island, of 30 miles' circumference, and inhabited by less than 2,000 wretched savages, there exist multitudes of rude stone statues, some of them of colossal size, and standing on long platforms of Cyclopean masonry. The present inhabitants, whose language is radically the same as that of Tahiti, have no tradition of the race that made them. The existence of these sculptures is thought to strengthen the conclusion, arrived at on other grounds, that the Polynesian islands are relics of a submerged continent.

EASTERN ARCHIPELAGO. See MALAY ARCHIPELAGO, *ante*.

EASTERN CHURCHES include: I. The Greek church, which contains in Russia about 55,000,000; in Turkey, 11,500,000; in Austria, 3,000,000; in Greece, 1,225,000; and in the United States (chiefly in Alaska), 50,000; in all, more than 70,000,000. II. Armenians, 3,000,000. III. Copts and Abyssinians, 3,000,000. IV. Jacobites (in Turkey and India), 220,000. V. Nestorians, including the Christians of St. Thomas, in India, 165,000. The total in them all is about 76,500,000.

EASTERN EMPIRE. See BYZANTINE EMPIRE, *ante*.

EASTERN QUESTION, in popular usage, is the problem of the future disposition of the Turkish empire and its territory, as related to the supposed designs of Russia, and to the interests of other European nations, England and Austria in particular. Voltaire, in the time of Catherine II., characterized Turkey as "the sick man," and for a hundred years it has been an assumption of European diplomacy that the empire was on the road to disintegration and death. In these circumstances, Russia, from her geographical position and in accordance with her traditional policy, waits for an opportunity to seize and absorb the territory of "the sick man." Other European nations, each for reasons of its own, dread such an extension of Russian domination. Austria, if Turkey should be despoiled, would naturally claim for herself a slice of the territory; and England fears that if Constantinople should fall into the possession of Russia, the highway to her eastern possessions would be closed, and Russia become dominant in that quarter. The question, moreover, assumes a religious aspect, Turkey being a Mohammedan power, and Russia finding an excuse for aggressive designs in the assumed necessity of affording protection to the Christian populations in the Turkish empire. England, on the other hand, though at the head of the Christian powers, yet being anxious to preserve the autonomy of Turkey as a subservient empire, is placed in a position of seeming indifference to the wrongs which Russia is so zealous to redress. The Crimean war of 1854–56 had its origin in the desire to check the advance of Russia, and the treaty of Paris put that power under sharp restrictions. Russia, by the recent invasion of Turkey, roused again the hostility of the European powers, which found expression in the treaty of Berlin, greatly limiting the fruits of the Russian conquest, and putting that empire under annoying restraints. Turkey was made to promise certain reforms, which, if carried into effect, would deprive Russia of excuse for further aggressions; but the promise has not been and is not likely to be fulfilled: it is doubtful indeed whether the fulfillment is within the power of Turkey. The eastern question, therefore, has not yet reached a permanent solution, nor is its approach to such a solution now evident, especially as complications arising from the claims of Greece to an adjacent portion of Turkish territory are assuming (1880) a more threatening aspect.

EASTERN, or ORIENTAL RITE, the name given to the rituals of the Armenian, Coptic, Greek, and Syrian Roman Catholics, who, acknowledging the supremacy of the pope of Rome, have been allowed to retain their own modes of performing divine worship. These differ from the Latin, not only by being in the language common among the people, but also in continuing "communion in both kinds" to the laity, and marriage to the lower clergy. Among these branches of Roman Catholics there are about 80 bishops, of whom 5 are patriarchs and 26 archbishops.

EASTERN SHORE, the counties of Accomack and Northampton in Virginia, and all of Maryland lying e. of Chesapeake bay (sometimes including Delaware also). It is a fertile region, famous for its product of peaches and garden vegetables, and equally famous for oysters. The country, though low and level, is generally healthful, and the climate is mild and equable. It is intersected by railroads, and there is abundance of steam-boat navigation. Until invaded by railroads and overrun by small owners, this was the "blue blood" section of Virginia, noted for aristocracy and hospitality.

EASTER OFFERINGS, or EASTER DUES, small sums paid to the parochial clergy in England by their parishioners at Easter, as a compensation for personal tithes, or the tithe for personal labor.

EASTER TERM, LEGAL. For a general history of the law terms in England, see LAW TERMS. E. T. was formerly dependent upon the movable feast of Easter, and was hence called a movable term. It commenced on the Wednesday fortnight after Easter Sunday, and lasted till the following Monday three weeks. But by 11 Geo. IV. and 1 Will. IV. c. 70, amended by 1 Will. IV. c. 3, E. T. now begins on 15th April and ends on 8th May. If any of the days between the Thursday before and the Wednesday after Easter fall within term, no sittings in banc (q.v.) are held on those days, and the term is prolonged a corresponding number of days.

EAST FELICIANA, a parish in s.e. Louisiana, on the Mississippi and Amite rivers, reached by the Clinton and Port Hudson railroad; 500 sq.m.; pop. '70, 13,499—9,393 colored. It is generally level, well-watered, and fertile; producing corn, cotton, rice, etc. Seat of justice, Clinton.

EAST HADDAM, a t. in Middlesex co., Conn.; on the e. bank of the Connecticut river, about 16 m. from its mouth, and 30 m. below Hartford; pop. '70, 2,951. It has considerable cotton manufacture and some trade. The surface is hilly; and among the hills in the n.e. part, near the river, remarkable subterraneous noises, as of rumbling and jarring, have occasionally been heard, though of late years more rare than formerly. The sound is called "Moodus noise," from the name given to the region by the Indians, who ascribed to the sound a supernatural origin. Its cause has not been ascertained.

EAST HAMPTON, a t. in Hampshire co., Mass., on the New Haven and Northampton railroad, in the beautiful valley of the Connecticut, 5 m. s.w. of Northampton; pop. '70, 3,620. Its manufactures are various and extensive. It has a good public library, many good schools, and fine public buildings, such as a town-hall and churches. Williston seminary for young men, founded here by Samuel Williston, and endowed

by him with more than a quarter of a million dollars, is a school of the highest grade below the collegiate, and has for many years attracted large numbers of students.

EAST HAMPTON, a t. in Suffolk co., N.Y., comprising the e. end of Long Island, including the peninsula of Montauk; reached by the Long Island railroad; pop. '75, 2,299. Much of the land is a narrow, sandy tract, between the ocean and the sound, of little value. The w. portion is fertile, producing fruits, vegetables, etc. The extreme e. part, known as Montauk, is a breezy, grassy upland, scarcely inhabited, affording fine pasturage to immense herds of cattle. The village of East Hampton is 7 m. s.e. of Sag Harbor, and a mile from the ocean. It is an agreeable and popular summer resort.

EAST HUMBOLDT MOUNTAINS, in Elko co., Nevada; a range with peaks 15,000 ft. high; for the most part well-wooded. Fremont's pass is in this range.

EAST INDIA ARMY. When the East India company (q.v.) first sent factors or agents to India, an army was not thought of. Military forces arose out of the exigencies of the times. Some of the first troops in the company's pay were mere adventurers; some were liberated convicts; some deserters from European armies. Gradually organization was introduced, and improved arms furnished. As the power of the company increased, natives entered the battalions; until at length most of the troops were Hindus or Mohammedans, drilled by non-commissioned officers sent out from England. A few regiments were raised in England; a much larger number were raised in India; but all alike were officered by the company's favored English officers, largely paid, and having many opportunities for making rapid fortunes. The ranks were filled by enlistment; the company never compelled the natives to become soldiers; the pay offered was always such as to induce a sufficient number of men to enter. Their periods of leave of absence were liberal; and after a certain number of years' service, they retired on a pension sufficient to support them for the remainder of their days.

At the period immediately preceding the outbreak of the revolt in 1857, the army in the pay of the company comprised about 24,000 royal troops (lent to, and paid for by, the company); 18,000 European troops, raised and drilled by the company in England; 180,000 native regulars; and 60,000 native irregular horse—making about 280,000 in all. This large force was irrespective of 40,000 contingents furnished by dependent native princes, and of the native armies belonging to the independent and semi-independent princes. The company's troops formed three distinct armies, each under its own commander-in-chief, and each stationed in one particular presidency. In these three armies, three kinds of troops—Europeans, native regulars, and native irregulars—had their own special organization. In order to secure unity of action when necessary, it was customary to give the commander-in-chief of the Bengal army precedence over those of Madras and Bombay; he was, in effect, commander-in-chief of the whole of the company's forces. There were too few English officers with the native regiments, and these, in most cases, knew too little of the men under their command. This was not the *cause* of the revolt in 1857, but it was one of the circumstances that led to the rapid spread of the revolt when once begun. To what extent this fine army melted away during 1857 and the two following years, is described under INDIA. Speaking generally, it may be said that the armies of the Madras and Bombay presidencies remained faithful, especially the infantry. It was in the Bengal army that the disruption chiefly occurred. The irregulars, both cavalry and infantry, raised amongst the Sikhs and Punjabees, were in almost every case faithful.

In Aug., 1858, the act which transferred the government of India from the company to the crown received the royal assent. The army was transferred as well as the political power. As the Sikhs had behaved well, most of the regiments from the Punjab were retained, as well as most of the native regiments in the Bombay and Madras presidencies; but it was not deemed expedient to restore the native regiments of Bengal proper, which had proved so treacherous. In that year, at the suggestion of earl Canning, a committee was appointed to inquire into the whole circumstances relating to the reorganization of the army. The company originated the inquiry, but the commissioners did not make their report till after the transfer of the company's powers to the crown. Although the commissioners' report was presented in the summer of 1859, very little was effected during the remainder of that year, or in 1860, to reorganize the Indian army; matters were kept together in a provisional way. Meanwhile, when the European troops of the company's army were turned over to the crown, a disturbance, amounting almost to a mutiny, occurred. The men claimed that, as they had enlisted into the company's service, they ought not to be transferred without their own consent asked, or without receiving a bonus on re-enlisting. To prevent a dangerous excitement, the government allowed such as chose to retire.

In 1861, an act was passed reorganizing the Indian army. The *British* portion of it now forms part of the queen's army generally, with certain honorary distinctions, and takes its turn at home and in the colonies like the rest; but the expenses are paid out of Indian, not imperial revenues. The *native* portion is managed wholly in India; but during the eastern crisis, connected with the war between Russia and Turkey, a considerable force of native Indian troops was sent to Malta, for service in Europe—in case of England being involved in war. On the reorganization of the Indian army in 1861,

the 21st hussars, with the 105th, 106th, 107th, 108th, and 109th foot, were formed from the European troops previously in the service of the East India company.

EAST INDIA COMPANY. On the 31st Dec., 1600, a charter was granted by queen Elizabeth to a number of London merchants, under the title of "The Governor and Company of Merchants of London trading to the East Indies." From the time when Vasco da Gama effected the eastern passage to India, by doubling the cape of Good Hope, in 1497, the Portuguese carried on an extensive trade with that country, unaffected by rivals until nearly a century afterwards, when the Dutch and the English began to compete with them. This competition became formidable when two "East India companies" were established, one at Amsterdam and one in London. It is of the latter of these that we here treat. The charter was exclusive, as is usual in such cases; prohibiting the rest of the community from trading within the limits assigned to the company. Those limits were enormous, comprising the whole space, land and sea, from the cape of Good Hope eastward to cape Horn—i.e., the whole of the Indian and Pacific oceans. The charter was for fifteen years. The company speedily sent out ships to Java and Sumatra, which returned with calicoes, silk, indigo, and spices. It was then determined to make some kind of settlements on the coast of Hindustan itself; and about 1612, the company obtained permission from the native princes to establish factories or agencies at Surat, Ahmedabad, Cambay, and Gogo.

The company's charter was renewed from time to time, with various modifications, but not without much contention and difficulty. Gradually establishments were formed in Java, Sumatra, Borneo, Celebes, Malacca, Siam, the Banda islands, and other places in the east; as well as on the Coromandel and Malabar coasts of India itself. The first beginning of Madras dates in 1640, of Calcutta in 1645, and of Bombay in 1665, as chief establishments of the company. In 1662, Charles II. gave them permission "to make war and peace on the native princes"—a privilege of which they largely availed themselves for nearly 200 years.

In 1698, the crown granted a charter to a *new* E. I. C., who offered a loan of £2,000,000 to the state; but this naturally led to wranglings, and the two companies were united into one by an act of parliament passed in 1702. The constitution then established was maintained with little alteration as long as the company existed. Every shareholder who held £500 of the company's stock became a member of the court of proprietors, and this court had legislative functions in all that related to the company's affairs. The proprietors annually chose 24 to form a court of directors, from those of their number who held not less than £2,000 of stock. Six of the directors went out of office every year; they retired in rotation, so that each had four years of office. It was a general custom with the proprietors to elect the same persons as directors over and over again. The court of proprietors was to meet once a year, or oftener if necessary; the court of directors as often as the directors chose, provided 13 were present. Theoretically, the constitution of the company was very democratic; but practically the affairs were in the hands of the directors; for the proprietors took little other interest than in receiving their half-yearly dividends. The proprietors had from one to four votes each, according to the amount of stock held by them. The board of control, of later formation, bore relation to the governmental affairs of India.

Properly speaking, the company were only merchants: sending out bullion, lead, quicksilver, woolens, hardware, and other goods to India; and bringing home calicoes, silk, diamonds, tea, porcelain, pepper, drugs, saltpeter, etc., from thence. Not merely with India, but with China and other parts of the east, the trade was monopolized by the company; and hence arose their great trade in China tea, porcelain, and silk. By degrees, avarice and ambition led the company, or their agents in India, to take part in the quarrels among the native princes; this course gave them power and influence at the native courts, from whence arose the acquisition of sovereign powers over vast regions. India thus became valued by the company, not only as commercially profitable, but as affording to the friends and relations of the directors opportunities of making vast fortunes by political or military enterprises. It is not the purpose of the present article to trace the political affairs of the company, or the rise of a British empire in India; that will be done under INDIA, BRITISH; it will suffice here merely to state, that no *national* or *patriotic* motive marked the beginning of this course.

In 1744, the company obtained a renewal of their charter till 1780, but not without a loan of £1,000,000 to government; for the monopoly was distasteful to the nation at large. France, too, had an E. I. C., and the struggles between the two companies for power in the southern part of India, led to constant warfare between them during the remainder of the century. Other loans to government were the means of obtaining further renewals of the charter in later years. In 1833, the legislature took away all the *trading* privileges of the company. The dividends to proprietors of East India stock were thenceforward to be paid out of taxes imposed by the company on the people of India, in such provinces as were under British dominion. From that year the company's powers became anomalous; the company could not *trade*, and could not *govern* without the sanction and continued interference of the imperial government. The wars in India, since that year, have been waged by England as a nation, rather than by the company; and England practically, though not nominally, became responsible for the

enormous cost of those wars. In 1853, the charter was again renewed, with a further lessening of the power of the company, and an increase of that of the crown.

Had not the Indian revolt occurred in 1857, the last charter would have remained in force until 1873; but that gigantic calamity led to the resolution—a resolution the wisdom of which was disputed by many of the best judges of Indian affairs—of concentrating the power in the hands of the imperial government. In spite of a strenuous resistance, in 1858, the company were forced to cede their powers, by an act which received the royal assent on the 2d of August. The charter of 1853 had provided that £6,000,000 of India stock should have 10½ per cent dividend *guaranteed* by England out of the revenues of India; and that parliament should redeem this stock at cent per cent premium any time after the year 1873. The act of 1858, therefore, contained due clauses for carrying out these provisions, and transferred the whole of the company's powers to the crown.

The company continued to exist, but for little other purpose than that of receiving and distributing dividends. Most of the distinguished men, military and political, till then in the company's service, accepted office under the crown, to assist the government by their general knowledge of Indian affairs. These affairs are now managed by a secretary in council at the new India office. The valuable library and museum of the company have passed over to the crown; and an act of parliament (1873) provides for the paying off of the India stock, and the final extinction of the once famous East India company.

EAST INDIES, as distinguished from *West Indies,* include not merely the two great peninsulas of southern Asia, but likewise all the adjacent islands from the delta of the Indus to the northern extremity of the Philippines. They thus extend, to use round numbers, in lat. from 35° n. to 10° s., and in e. long. from 65° to 130°. At one time, the name of India had, towards the e., a still wider application, occasionally comprising Japan, nay, everything in that direction except China alone. See INDIA.

EASTLAKE, Sir CHARLES LOCK, president of the royal academy of London, was b. at Plymouth in 1795, educated at the charter-house in London, and entered as a student at the royal academy. Subsequently, he went to Paris, where he studied and copied the great paintings then collected in the Louvre. The return of Napoleon from Elba compelled him to leave France. He went back to his native town, and supported himself by portrait-painting. When the *Bellerophon,* with Napoleon on board, appeared in the port of Plymouth, E. profited by the opportunity, and produced his first important picture, "Napoleon at the Gangway of the *Bellerophon,* attended by some of his Officers." In 1817, sir Charles visited Italy and Greece, sketching assiduously in both countries. During a residence of several years in Rome, he executed his "Girl of Albano leading a Blind Woman to Mass," "Isidas the Spartan," "Pilgrims arriving in Sight of Rome," and many others, illustrative of Italian customs and scenery. In 1827, he was elected an associate, and in 1830, a full member of the royal academy. His "Greek Fugitives Prisoners to Banditti," etc., added to his already great reputation; and in 1841, appeared what many conceive to be his masterpiece, "Christ lamenting over Jerusalem." It was immensely admired, the duplicate painted for Mr. Vernon being reckoned one of the most valuable pictures in the Vernon gallery. "Hagar and Ishmael" was exhibited in 1844; "Heloise" in 1845; "The Escape of Francesco Novello di Carrara with Taddea d'Este, his Wife, from the Duke of Milan," in 1850; "Beatrice" in 1855, etc. In 1850, he was elected president of the royal academy, when he received the honor of knighthood. Subsequently, he was appointed director of the national gallery, in which capacity his services were of the highest importance; for besides its improved arrangement, many of the most valuable specimens of the best schools were added to the collection. Sir Charles also acquired a high reputation as a writer on art. In 1847, he published *Materials for the History of Oil Painting,* a work of great learning and research. He contributed several articles to the *Penny Cyclopædia* on subjects belonging to his profession, and executed a translation of Goethe's *Farbenlehre.* In 1853, he received the title of D.C.L. from the university of Oxford. He died Dec., 1865.—LADY EASTLAKE (b. Elizabeth Rigby) is an artist of no mean power, and also has distinguished herself as an authoress by her *Letters from the Baltic; Livonian Tales;* and her articles on subjects connected with art in the *Quarterly Review.*

EASTLAND, a co. in n.w. Texas, on Leon river; 900 sq. m.; pop. '70, 88. Cattle raising is the only industry.

EAST LIVERPOOL, a village in Columbiana co., O., on the Ohio river, and the Pittsburg and Cleveland railroad; pop. '70, 2,105. Manufactures of pottery, china, and parian ware are among the leading industries.

EAST MAIN, formerly a portion of the Hudson bay territories, now incorporated in the dominion of Canada, is bounded n. by Hudson's strait, and w. by Hudson's bay down to its southern extremity, meeting Labrador on the e., and Canada on the south. This immense region, thrice as large as Great Britain, is generally bleak and sterile, yielding little to commerce but fish-oil and a few furs.—A river of the same name, otherwise called the *Slade,* crosses its southern section, entering Hudson's bay, here known as James's bay, about lat. 52° 15′ n., after a course of 400 miles.

EASTMAN, CHARLES GAMAGE, 1816-61; b. Me.; removed with his parents to Vermont, and was editor of the Burlington *Sentinel, Spirit of the Age,* and *Vermont Patriot.* He was a member of the state senate for several years. In 1848, he published a volume of poems.

EASTMAN, MARY HENDERSON, b. Va., 1818; daughter of Dr. Thomas Henderson, and wife of capt. Seth Eastman, of the U. S. army. He was stationed for several years in the Indian country, where his wife wrote *Dahcotah, or Life and Legends of the Sioux; Romance of Indian Life;* and other works of the kind. In 1852, she published *Aunt Phillis's Cabin,* in response to Mrs. Stowe's famous *Uncle Tom's Cabin.* She has also published the *American Aboriginal Portfolio,* and *Chicora and other Regions of the Conquerors and the Conquered.*

EAST NEW YORK, a large village or city adjoining the city of Brooklyn, in Kings co., N. Y. It may be considered a part of Brooklyn, having no distinctive features of its own. It is mainly on a high ridge, and affords a fine view of the rich garden lands in the s. part of Kings co., the numerous villages, Jamaica bay, and the ocean beyond, Coney island, and Rockaway beach. The pop. is about 12,000.

EASTON, a flourishing t. of Pennsylvania, in the United States, stands in the fork between the rivers Delaware on the e. and Lehigh on the w., about 20 m. above the head of navigation on the united streams. Though the place is thus far cut off from the sea, yet, for internal trade, it clearly occupies a commanding position. Its natural advantages, too, have been largely improved. To say nothing of railways, E. is the common terminus of three canals—one of 60 m., down on the right side of the Delaware as far as Bristol; another of 84 m., along the Lehigh, into the great coal-field of the state; and the third of 102 m., leading across the country to Jersey City. Within the immediate neighborhood, likewise, iron ore and limestone abound. Having an unlimited supply of water-power, the town possesses extensive manufactories. It is the seat of Lafayette college, founded in 1832. Pop. '70, 10,987.

EASTON, JAMES, b. Conn. He was a col. in the revolutionary army, raising a regiment by his own exertions, and spent his entire fortune for the service. He was one of the leaders in the capture of Ticonderoga, and brought the news of the victory to the provincial congress. He was also with Montgomery in the invasion of Canada. In Jan., 1776, he received the thanks of congress, but was forced through the enmity or jealousy of Benedict Arnold to quit the service in that year.

EASTON, NICHOLAS, b. Wales, 1593; d. R. I., 1675. He came to Massachusetts, 1634; in 1638, he removed to Rhode Island, and built the first house in Newport. He was governor of the colony in 1650. His son John was governor in 1690–95, and was the author of a *Narrative of the Causes which led to King Philip's War.*

EAST ORANGE, a t. in the co. of Essex, N. J., lying between Newark on the e, and Orange on the w., and on the line of the Delaware, Lackawanna and Western railroad, by which it is connected with New York and the west. It is growing rapidly; and has an intelligent and thriving population, being the residence of a large number of people doing business in New York. It has 10 or 12 churches, excellent schools, a weekly newspaper, and numerous handsome private residences. The principal streets are macadamized; many of them are bordered with fine shade-trees, and lighted with gas. Pop. '70, 6,500.

EASTPORT, a garrison t. of Maine, in the United States, is situated on one of the small islands of Passamaquoddy bay, which receives the St. Croix, the international boundary during its whole course between the United States and British America. On the coast, therefore, it may be said to be the frontier town of the union towards the n. e. Its harbor is deep enough for the largest vessels. The tide rises within it to a height of 25 ft.—a height far exceeded in many other parts of the bay of Fundy, of which Passamaquoddy bay is an inlet. The place is largely engaged in the fisheries and in shipbuilding. Pop. '70, 3,738.

EAST RIVER, the strait between Long Island sound and New York harbor. It is 20 m. long, separating New York city on the w. from its suburbs, Williamsburg and Brooklyn, on the east. Its narrowest part is the Hurlgate or Hellgate, which is about the middle of its course. Here the rocks, which once obstructed the passage, have been removed by blasting. The name—clearly a misnomer for an arm of the sea—is convenient as contrasted with the North river, or Hudson, and may have arisen from the river-like action of the tides—an action so powerful as to have here and there materially deepened the channel.

EAST SAGINAW, a city in Saginaw co., Mich., at the head of steamboat navigation on the Saginaw river, 17 m. from its mouth. It is on the Flint and Père Marquette, and the Jackson and Saginaw railroads, and is the terminus of the Saginaw Valley and St. Louis railroad. Pop. '74, 17,084. It has an important lumber and salt trade, sending out 135,000,000 ft. of lumber annually from its 17 saw-mills, and 200,000 barrels of salt. It is handsomely laid out, and built; and has horse railroads and water-works. It is the prosperous center of a fertile surrounding country; the yearly increase of population having reached 40 per cent. The city of Saginaw is on the opposite side of the river.

EATON, a co. in s. Michigan, on Grand river, intersected by the Chicago and Lake Huron, and the Grand River Valley division of the Michigan Central railroad; 576 sq.m.; pop. '74, 26,907. The surface is undulating, and the soil productive. Wheat, corn, barley, maple sugar, butter, and wool are the chief staples. Co. seat, Charlotte.

EATON, Amos, 1776–1842; b. N. Y.; graduated at Williams college in 1799, and became a lawyer and surveyor at Catskill, N. Y. He studied natural sciences and lectured on botany, chemistry, geology, and mineralogy, and with Drs. T. Romeyn Beck and Lewis C. Beck he made a geological survey of Albany and Rensselaer counties. In 1820, he was professor of natural history in the medical college at Castleton, Vt. In 1824, he was at the head of the Rensselaer school of science in Troy. He published many works on botany, chemistry, geology, natural history, and agriculture.

EATON, Amos B., b. N. Y., 1806; graduated at West Point in 1826, and entered the army as officer of infantry. After service on the northern frontier, he was transferred, in 1838, to the department of subsistence, and served as commissary in Florida, on the Canada border, and in New York. In the Mexican war, he was chief commissary under maj.gen. Taylor, and in 1851–55 he was in the department of the Pacific. During the war of the rebellion he was depot commissary at New York city, and purchasing commissary stores for the armies in the field, and after 1864, head of the commissary bureau at Washington. He was made brevet maj.gen. for faithful, meritorious, and distinguished services.

EATON, George W., D.D., LL.D., 1804–72; b. Penn.; a Baptist minister, educated in Ohio university and Union college, and tutor in the last named institution in 1829. In 1831, he was professor of ancient languages in Georgetown (Ky.) college; 1832–50, professor of mathematics, natural philosophy, and ecclesiastical and civil history in the literary and theological institution at Hamilton, N. Y.; afterwards at the same place professor of systematic theology; 1856–68, president of Madison university; also, 1861–71, president of the theological institution.

EATON, John, Jr., PH. D., b. N. H., 1829; graduated at Dartmouth in 1854, studied theology at Andover theological seminary; ordained by the Maumee (O.) presbytery, 1861; commissioned chaplain of the 27th Ohio volunteers, 1861; appointed by gen. Grant superintendent of contrabrands, 1862; general superintendent of freedmen for Mississippi, Arkansas, w. Tennessee, n. Louisiana, 1862, serving till May, 1865. He was commissioned col. of the 63d colored troops, 1863; breveted brig.gen. of volunteers, 1865; assistant commissioner of the bureau of refugees, freedmen, and abandoned lands, 1865; state superintendent of public instruction for Tennessee, 1867–69; and U. S. commissioner of education, 1870. He has published many reports, chiefly upon education and the public affairs in which he participated; and established and edited, 1866–70, the Memphis *Daily Post*.

EATON, William, 1764–1811; b. Conn.; at 16 years of age, entered the revolutionary army and served through the war. Entering Dartmouth college, he graduated in 1790, and in 1792 was made a capt. in the regular army; in 1797, sent as diplomatic agent to Tunis, where he succeeded in putting an end to the outrages of the corsairs of that country upon American ships. In 1803, he returned, but the next year went back as navy agent of our government for the Barbary states. There was at the time a contest for the throne of Tripoli, with which country this nation was at war. Eaton found that the rightful bey, or ruler, had taken refuge in Egypt. He went to him, assisted in raising a force of 500 men, marched 600 m. over the Libyan desert, secured the assistance of the American fleet, and captured Derne after a furious assault, in which he was wounded. The reigning bey came against him, and desultory warfare followed. June 11, 1804, a general engagement took place, and the usurping bey was defeated. Eaton was about to march to Tripoli, install the rightful ruler, and release a large number of American captives, when news arrived that peace with Tripoli had been concluded by the American consul at Algiers. This put an end to his work, and he returned home. He settled in Massachusetts; the legislature of that state gave him 10,000 acres of land. Later, he was himself elected to the legislature. In 1806, Aaron Burr tried to engage him in the south-western conspiracy, but without success, and on Burr's trial Eaton was a witness against him.

EAU CLAIRE, a co. in w. Wisconsin, on Chippewa and Eau Claire rivers, reached by the Chicago, St. Paul, and Minnesota, the Chippewa Falls and Western, and the West Wisconsin division of the Milwaukee and St. Paul railroad; 648 sq.m.; pop. '75, 15,991. The surface is uneven, and the soil fertile; principal productions, wheat, corn, oats, and butter. Co. seat, Eau Claire.

EAU CLAIRE, a city and seat of justice of Eau Claire co., Wis., at the junction of the Eau Claire and Chippewa rivers, and at the head of steam-boat navigation on the latter; on the West Wisconsin railroad, 88 m. from St. Paul; pop. '75, 8,440. With its suburbs of West and North Eau Claire, it is the chief commercial point in n.w. Wisconsin. It is the outlet of the Chippewa lumber district; has good water-power from both streams, with opportunities for the safe storage of large quantities of logs, and manufactures about 300,000,000 ft. of lumber annually.

EAU DE COLOGNE, a celebrated perfume, invented long ago by the Farina family in Cologne, and since manufactured chiefly by members of the same family. It is also made in France. It consists principally of spirits of wine, along with numerous essential oils harmoniously mingled together, so as to produce a refreshing and grateful scent. The recipe said to be followed in the manufactories at Cologne is twelve drops of each of the essential oils neroli, citron, bergamot, orange, and rosemary, along with one dram of Malabar cardamoms, and one gallon rectified spirit. The whole is distilled together, and the condensed liquid constitutes Eau de Cologne.

EAU CRÉOLE, a very fine liqueur, made in Martinique, by distilling the flowers of the mammee apple (*mammea Americana*) with spirit of wine.

EAU DE JAVELLE is a solution of hypochlorite of potash, which, when administered to man, is stated to act powerfully on the nervous system, and to give rise to general rigidity, and even to cause tetanic spasms.

EAU DE LUCE is the name given to a preparation which was formerly a very popular stimulant, and is still occasionally used. It is a mixture of oil of amber with alcohol and ammonia, and has a milky appearance. It had a great reputation in cases of snake-bites.

EAU DE VIE. See BRANDY.

EAUX BONNES, a fashionable watering-place of France, in the department of Basses-Pyrenees, is situated 20 m. s.s.e. of Oloron. It stands in a narrow gorge surrounded with rocks, and consists of a street of about 30 large and well-built hotels and lodging-houses. On the opposite side of the street there is an open space laid out as a shrubbery and planted with trees; it is called the Jardin Anglais. E. B. is much frequented on account of its hot sulphureous springs, which are four in number, and are used for bathing purposes. Their temperature does not exceed 91° F. There is also a cold spring here, which is used for drinking. The springs are said to be very valuable, on account of their power of checking the progress of incipient consumption, and of curing various affections of the lungs and chest. The season of the E. B. lasts from June to Oct., and during that time it is crowded with visitors and patients.

EAUX CHAUDES, LES, 3 m. s.w. of the preceding, is a similar place of resort. Its springs have the same properties as those of the Eaux Bonnes.

EAVES, in architecture, the edge of a sloping roof which overhangs the wall, for the purpose of throwing off the water. When there is no concealed gutter at the margin to conduct the water to spouts or pipes, but the water is allowed to run from the roof to the ground, they are called *dripping eaves*.

EAVESDRIP, or EAVESDROP (Ang.-Sax. *yfesdrype*). "The owner of a private estate," says Kemble (*Saxons in England*, vol. i. p. 45), "was not allowed to build or cultivate to the extremity of his own possession, but must leave a space for eaves. The name for this custom was *yfesdrype*." The space was regulated by the charter by which the property was held. In a charter of 868 A.D., it is limited to 2 feet. This Saxon custom corresponded to the well-known urban servitude of the Romans called stillicide (*stillicidium*). The eavesdrop was the water which dropped from the projecting roof, and in this sense is opposed to the water collected in a spout, to which the Romans gave the name of *flumen*. Similar regulations existed in Greece, and have probably existed in all countries.

EAVES-DROPPERS "are such as listen under walls or windows, or the eaves of houses, to hearken after discourse, and thereupon to frame slanderous or mischievous tales."—Blackstone's *Comm.* iv. 168. Such persons are, by the law of England, regarded as common nuisances: they may be indicted at the sessions, and on conviction are punishable by fine. Persons who by their conduct expose themselves to suspicion of an intention to commit this offense, may be brought before a magistrate, and required to give security for their good behavior; 34 Edw. III. c. 1. See Hawk., P. C., I. 62, sec. 4.

EBAL AND GERIZIM. See GERIZIM and EBAL, *ante*.

EBB AND FLOW. See TIDES.

E'BELING, CHRISTOPH DANIEL, 1741–1817; b. Hanover. He was famous for extensive knowledge of oriental languages, classic literature, and geography and history. The congress of the United States gave him a vote of thanks for his *History and Geography of North America*. He made a collection of about 4000 books and 10,000 maps relating to America, which is now in the library of Harvard university.

EBENA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with alternate leathery leaves, and axillary flowers, which are monopetalous, somewhat leathery, and generally unisexual; the fruit fleshy. They have not a milky juice. They are regarded as allied to *aquifoliaceæ* (holly, etc.), *apocynaceæ*, and *oleaceæ*. About 160 species are known, mostly tropical, but a few are natives of Europe, and other temperate countries. The wood is in general remarkable for its hardness, as the different kinds of ebony (q.v.) and other species of *diospyros;* and on account of this quality, even that of species which never attain the ordinary size of timber trees is sometimes

accounted valuable, as of *royena lucida*, the African bladder-nut or zwart-bast, at the cape of Good Hope; where also that of *euclea undulata*, a hard brown wood, is esteemed for cabinet-work. The fruit of many species is eatable. See DATE PLUM. The fruit of *embryopteris gelatinifera* contains a viscid juice, and is used in all parts of India for paying boats.

EBENE'ZER, the name of a place marked by a monumental stone set up by Samuel in recognition of divine assistance in a battle with the Philistines. Its location cannot be satisfactorily determined. The name means "Stone of the help."

EB'ERHARD, AUG. GOTTLOB, a well-known German author, was b. at Belzig, in 1769, studied at Leipsic and Halle, and first attracted attention by his contributions to a periodical devoted to *belles-lettres*, entitled *Ida's Blumenkörbchen* (Ida's Flower-basket). Among his numerous works may be mentioned *List um List, oder was ein Kuss nicht vermag* (Trick for Trick, or what could not a Kiss do); *Ysop Lafleur's Sämmtliche Werke* (Ysop Lafleur's Collected Works); *Ferdinand Werner, der Arme Flötenspieler* (Ferdinand Werner, the poor Flute-player); and *Ischarioth Krall's Lehren und Thaten* (Iscariot Krall's Doctrines and Doings); *Hannchen und die Küchlein* (Jenny and the Chickens), a narrative poem in ten parts, which has gone through many editions, and been often translated into other languages; and *Der erste Mensch und die Erde* (The First Man and the Earth), a poem marked by simple dignity and lively representation. E., after a life of hard literary work, died at Dresden, 13th May, 1845.

EB'ERHARD, IM BART (Ger., with the beard), Count, and afterwards first duke of Würtemberg; 1445–96; the second son of count Ludwig I. He succeeded his elder brother, Ludwig II., at the age of 12, and before he was 14 wrested the government from his uncle Ulrich, who had been appointed his guardian. His tutor was the learned John Nauclerus, but Eberhard profited little by his learning, indulged his passions, and led a dissipated life. In 1468, he made a pilgrimage to Jerusalem, after which he abandoned his reckless mode of living, and became one of the most popular princes of Germany. He married Barbara, daughter of Lodovico di Gonzaga, whose influence over him contributed largely to the elevation of his character. He began to study, gathering around him men of learning; and at the solicitation of his wife founded in 1477 the university of Tübingen. In 1482, Eberhard, by the treaty of Minzingen, put an end to the evils which had arisen from a division of the county made in 1437 between his father and his uncle Ulrich, as representatives of the two lines of Urach and Stuttgart. By this treaty he secured the future indivisibility of Würtemberg and the right of primogeniture in his own family; he became at the same time the founder of the representative constitution of Würtemberg. He made Stuttgart his place of residence, and improved the laws and condition of the convents in his country. Though a lover of peace, he knew how to bear the sword when war was necessary; and by his courage and fidelity to his engagements secured the esteem and friendship of the emperors Frederick III. and Maximilian I. In recognition of his services, the emperor at his first diet, held at Worms in 1495, raised Eberhard to the dignity of duke, confirming at the same time all the possessions and prerogatives of his house; but Eberhard did not long enjoy his new dignity. His two children died in infancy, and with his death the line of Urach became extinct.

EBERHARD, JOHANN AUGUST, a philosophical writer of Germany, was b. at Halberstadt, 31st Aug., 1739; studied theology at Halle, 1756–59; and after spending several years as a preacher in Berlin and Charlottenburg, became professor of philosophy at Halle in 1778, and doctor of theology in 1808. He died 6th Jan., 1809. E.'s first work was his *Neue Apologie des Socrates* (New Apology of Socrates), 2 vols., Berlin, 1772; a work in which the rights of common sense are vindicated against the accusations of a narrow theology. It was received with much applause both in Germany and in other countries. Among his other writings may be mentioned *Sittenlehre der Vernunft* (Ethics of the Reason), Berlin, 1781; *Theorie der schönen Künste und Wissenschaften* (Theory of the Fine Arts and Sciences), Halle, 1783; *Allegemeine Geschichte der Philosophie* (Universal History of Philosophy), Halle, 1788; *Handbuch der Aesthetik* (Manual of Æsthetics), 4 vols., Halle, 1803–5; and *Versuche iner allegemeinen Deutschen Synonymik* (An Attempt towards a Complete Work on German Synonyms), 6 vols., Halle, 1795–1802, a work which was enriched and improved by Maas, 1818–21, and again by Gruber, 1826–30, but which was, at the time of its appearance, the best thing of the kind in the German language. Towards the close of his life, E. struggled, but without success, against the speculative excesses of the new schools of philosophy headed by Kant and Fichte. E. was a clear and sensible thinker, as well as an agreeable and interesting writer.

EB'ERHARD, KONRAD, 1768–1859; b. Bavaria; studied in Munich and Rome; sculptor and painter; became professor of sculpture in the Munich academy of fine arts. Many of his paintings illustrate the progress and triumphs of Christianity. Of his sculptures, the best known are the statues of St. Michael and St. George at the Isargate, Munich; and the tomb of the princess Caroline.

E'BERNBURG, a small t. in the Bavarian palatinate, is situated about 20 m. s.w. of Mayence, at the junction of the Alsenz with the Nahe. It is notable on account of the ruins of its castle, which formerly belonged to the famous knight Franz of Sickingen,

who was a devoted friend of the early reformers. His stronghold, which was once considered almost impregnable, afforded a secure retreat from danger and persecution to Melancthon, Bucer, Œcolampadius, and Ulrich von Hutten, the last of whom composed several of his works here. After the death of Sickingen, the castle of E. was besieged and dismantled by the electors of Hesse and Treves. Pop. about 500.

E'BERS, GEORG MORITZ, b. Berlin, 1837; studied at Gottingen and Berlin, and taught in the university of Jena. He has paid especial attention to Egyptian archæology, and has published *The Egyptian King's Daughter*, a description of the subjugation of Egypt by the Persians, in the form of a historical novel; *Egypt and the Books of Moses; Through Goshen to Sinai;* etc.

EBERT, KARL EGON, a Bohemian poet, was b. at Prague, 5th June, 1801; was educated there and at Vienna; and after filling several situations, settled in Prague. The honor of knighthood was conferred on him in 1871. His chief works are his *Dichtungen* (2 vols., 1824; 3d ed., 1845); *Wlasta, ein Böhmisch-nationales Heldengedicht in drei Büchern* (Wlasta, a Bohemian National Heroic Poem, in three books), Prag. 1829; and *Das Kloster, idyllische Erzählung in fünf Gesängen* (The Cloister, a Narrative Idyll, in five cantos), Stutt. 1833. These poems, especially the last two, are marked by lyrical vehemence, and elegance of language. They were received with applause, particularly in Bohemia, whose national traditions form their ground-work. E.'s compositions show a happy union of the German and Czech characteristics. He has also written a large number of dramas, of which *Das Gelübde* (The Vow) (1864) was received with public favor at Prague. He has also published some meritorious lyrical poetry.

E'BIONITES (Heb. *ebion*, poor), a name probably given originally by the hierarchical or influential party among the Jews, to those of their countrymen who professed the Christian faith, and who generally belonged to the *poorer* and more ignorant class (John, chap. vii., verses 48, 49). Subsequently, it would seem, the Gentile Christians, who were ignorant of Hebrew, employed it in a distinctive sense to designate their Jewish co-religionists, who, in addition to their belief of Christianity, observed the Mosaic law. Irenæus is the first writer who makes use of the name. It is highly probable that the E. first became an organized body or sect at Pella, a city in Peræa, on the eastern side of the Jordan, whither they had betaken themselves on the breaking out of the Roman-Jewish war in the time of Hadrian. Here, indeed, a strictly Jewish-Christian church continued to exist down to the 5th century. Among the E., however, there was by no means a unanimity of religious feeling, or uniformity of opinion. Two great divergent parties are clearly recognizable—the E. proper, and the Ebionitic Nazarenes. The former were little different from Jews: their conceptions of the Saviour were meager and unspiritual. They believed that Jesus was simply a man distinguished above all others for *legal* piety—pre-eminently a *Jew*, and selected as the Messiah because of his superior Judaism. Of course they denied his supernatural birth, yet not his resurrection, for "they lived in expectation of his speedy return to restore this city of God (Jerusalem), and to re-establish the theocracy there in surpassing splendor."—Neander. They were the genuine descendants of those Judaizers who plagued the church in the time of the apostle Paul. The Ebionitic Nazarenes, on the other hand (who at the close of the 4th c. seem to have dwelt chiefly about Berœa in Lower Syria, but at an earlier period may have been more widely diffused), were Jewish Christians, in the better sense of the term. They conceived it to be their *own* duty still to circumcise, keep the Sabbath, etc., but they had no wish to impose the peculiarities of Judaism on the Gentile Christians. They did not believe that Christianity was merely a glorification of Judaism, but a new life come into the world, in which the Gentile might at once participate, without undergoing a Mosaic ordeal. Like the stricter E., they used a *Gospel of Matthew;* but it contained what the other did not—an account of the supernatural conception and birth of the Saviour. According to Neander, who has very thoroughly investigated this question, there were a great many varieties of opinion among the E., springing out of the differences above spoken of, which it would be tedious to record. It is sufficient to say that *Essenism* (q.v.) modified Ebionism greatly, through the introduction of a Jewish mysticism, which recognized in Moses and Christ an inward identity of doctrine, and regarded them as revealers of the "primal religion," whose teaching, however, had been sadly corrupted. It is extremely probable that an Essenic Ebionite wrote the *Clementine Homilies.* See CLEMENS.

EB'OLI (ancient *Eburi*), a small t. of southern Italy, in the Principato Citeriore, about 16 m. e.s.e. from Salerno, is picturesquely situated at a considerable elevation above sea-level. The climate, which does not become too cold in winter, notwithstanding the position of the town, is very unhealthy in summer, owing to the number of streams in the neighborhood. There is an annual fair at E. which lasts 12 days. Pop. 7,300.

EB'OLI, ANNA DE MENDOZA, Princess of, daughter of a viceroy of Peru at the court of Philip II. of Spain in the 16th century. She was famous for her intrigues, fascinating the king, the secretary of foreign affairs, and other great men. She was charged with being implicated in the murder of Escobedo, the envoy of Don John of Austria.

EBONY (Lat. *ebenum;* but originally from the eastern name), a wood remarkable for its hardness, heaviness, and deep black color, is the heart-wood of different species of

diospyros, of the natural order *ebenaceæ*, the same genus which produces the date plum (q.v.), kaki, and other fruits. The best E., excelling in uniformity and intensity of color, is the produce of *D. ebenum*, which grows in great abundance in some of the flat parts of Ceylon, and is a tree of such magnitude, that logs of its heart-wood, 2 ft. in diameter, and varying from 10 to 15 ft. in length, are easily procured. *D. melanoxylon*, the E. tree of Coromandel, yields E. of good quality; *D. tomentosa*, *D. roylei*, and other Indian species, also yield it. In Mauritius and Madagascar, E. of very good quality is produced by *D. reticulata*. Other species of *diospyros* are much valued for their beautiful timber, very different in color from E., as calamander wood (q.v.) and cadooberia (*diospyros ebenaster*). The last-named species is found in India and Ceylon. The prevailing black of the wood is beautifully striped with a rich yellowish-brown; but in density and durability it is far inferior to ebony.—E. is chiefly used by cabinet-makers for veneering. The ancient Greeks and Romans were acquainted with it; and it is supposed that they obtained it either from India or Madagascar. They frequently inlaid it with ivory, for contrast of color. It is mentioned by Ezekiel (xxvii. 15) as an article of Tyrian commerce. It was at one time used in medicine, as a laxative and sudorific; it has a somewhat pungent taste.—The name E. is sometimes given to the black wood of trees very different from those of the genus *diospyros*. An Abyssinian tree called mozzungha (*fornasinia*), of the order *leguminosæ*, produces a black heavy wood, much resembling ebony.—West Indian E. or American E., is produced by *brya ebenus*, also of a natural order *leguminosæ*, but the wood is of a greenish-brown rather than a black color. It receives a good polish, is very hard and durable, and much sought after by musical-instrument makers. It is one of the articles of export from the West Indies to Britain. But the tree is of small size, seldom more than 12 ft. high, and the trunk only a few inches in diameter.

E'BRO (Lat. *Iberus*), an important river of Spain, rises in the province of Santander, at a point greatly elevated above the level of the sea, about 12 m. n.w. of Reynosa, flows s.e. for about 25 m.; then e. past Frias, after which it maintains a general s.e. course, passing Miranda, Haro, Logroño, Tudela, and Zaragoza, when it turns n., passes Mequinenza, flows s.e. to Mora, s. to Tortosa, and finally e. to the Mediterranean, into which it falls after a course of about 540 miles. Its mouth is choked up with sand, and, to render it navigable, a canal called the San Carlos has been carried through the delta. Its principal affluents are the Najerilla, Jiloca, and Guadalope from the right, and the Aragon, Gallego, and Segre from the left. The course of the E. is chiefly through narrow, and sometimes rocky valleys; and its bed is characterized by many shoals and rapids which interrupt the navigation. This is partly remedied, however, by means of the Imperial canal, which extends from the vicinity of Tudela to a point 40 m. below Zaragoza.

EBULLIOSCOPE, an instrument for ascertaining the strength of distilled liquors by observing the boiling point and the atmospheric pressure.

ÉCARTÉ, a game at cards, probably first played early in the present century in Paris, though it appears to have grown out of an old game called *la triomphe*, or French-ruff. It is usually played by two persons, though sometimes by three, the third player taking the place of the loser in the first game, and the pool not being taken except by the winner of two games in succession. In French écarté, bystanders are permitted to advise, and the player losing leaves the table, his adviser taking his place. If, however, the loser is playing *la chouette* (i.e., taking all bets offered), he need not retire on losing. The small cards are removed from a pack, and the player cutting highest deals. He gives five cards, by two and three at a time, to his opponent and himself, and turns up the eleventh card for trumps. The trump card, if a king, counts one for the dealer. His adversary, if satisfied with his hand, plays; if not satisfied, proposes, and the dealer can accept or refuse. Should he accept, each may discard, face downward, as many cards as he may choose, receiving fresh ones from the cards yet undealt, these being given first to the non-dealer, till his hand is complete. A second proposal and a third may be made, and so on till the player is satisfied; but if the dealer refuse, the hand must be played without discarding. The king of trumps scores one if in either hand. The non-dealer being satisfied with his hand, leads; the dealer follows; and the trick is taken by the highest card, or the trump. The king is the highest. The winner of a trick leads to the next. The second player must follow suit, and must win the trick if he can. The game is scored by the king, as explained, and the majority of tricks. Three tricks score one for the point; all five tricks won by one player score two for the *vole*. When the non-dealer does not propose, or his proposal is refused, and he fails to gain three tricks, the dealer scores two, but no more even though he win the *vole*. The game is five up.

ECBATA'NA (Agbatana, Achmĕta, Hagmatana), the ancient capital of Media, situated at a distance of 12 stadia (about 1½ m. from Mt. Orontes, the modern Elwend. Its foundation was attributed by popular belief to Solomon or Semiramis, while the book of Judith ascribes it to Arphaxad (Phraortes?), and Herodotus to Deioces (728 B C.). It lay upon a conical hill, crowned by a temple of the sun, and was inclosed by seven concentric walls, the innermost of which was gilded, and the next plated with silver; while the rest, in their order outwards, were painted orange, blue, scarlet, black, and white, respectively. As they rose in gradation towards the center, all the battlements

with their gorgeous hues—probably representing, in Sabæan fashion, the seven planetary spheres or the seven climes—were visible at once. The city is reported to have been 250 stadia in circumference. Its principal buildings were the citadel—a stronghold of enormous dimensions, where also the archives were kept, in which Darius found the edict of Cyrus the great concerning the rebuilding of the temple in Jerusalem—and the royal palace. Cedar and cypress only were used for the woodwork, and the ceilings, beams, and rafters were overlaid with gold and silver. The mild climate and the magnificence of its structure singled out E. as the favorite summer residence, first of the Median, then of the Persian, and, lastly, of the Parthian monarchs. After the battle of Arbela (331 B.C.), Alexander followed Darius thither, and secured an immense booty. It was again pillaged by the Seleucidæ; but such were the riches of this place, that Antiochus the great still found 4,000 talents' worth of silver to carry away. E. subsequently fell into the hands of the Parthians; and it has since so utterly sunk into decay, that notwithstanding the frequent mention that is made of it both in the Bible and in classical writings, its very site can no longer be fixed with certainty. Gibbon and Jones tried to identify it with Tabriz or Tauriz; Williams, with Ispahan; while recent explorers, such as Rennell, Mannert, Kinneir, Morier, and Ker Porter, generally agree that the present Hamadan, with the supposed tombs of Mordechai and Esther (see HAMADAN), occupies the site of ancient Ecbatana. Sir Henry Rawlinson assumes two Ecbatanas, one the present Hamadan, the other the present Takhti-Suleiman, 36° 25 n. lat., 47° 10′ w. long. Both the orthography of the scriptural Achmĕta, and the cuneiform Hagmatana in the Behistun inscriptions, which, by changing the *m* into *b*, became Agbatana in Greek, seem to point to Hamadan. Broken columns, a few cuneiform inscriptions, coins, medals, and a fragmentary stone lion, placed there, according to the Eastern legend, by the sorcerer Apollonius of Thyane, at the command of Nebuchadnezzar, in order to guard the town from excessive cold and snow—all dug out near Hamadan—are all that now remains of that once most royal of cities. There was another ECBATANA in Persis, which was given to the Magi; and a third in Syria, at the foot of Carmel, the present Kaïffa, where Cambyses, the son of Cyrus, suddenly died 520 B.C.

ECCALEO'BION, an oven for hatching eggs. The eggs are placed on shelves one above the other, so fixed that the eggs can be turned over once in a day or two. The proper temperature is provided by steam or warm water. Artificial hatching was one of the most ancient inventions of Egypt. Perhaps the idea was taken from the hatching of eggs in the hot sand of that country.

ECCARD, JOHANNES, 1553–1611; b. Prussia; a composer of church music. He was a pupil of Orlando Lasso, at Munich. In 1583, he became assistant conductor, and in 1595, chapel-master, at Konigsberg. In 1608, he was chief conductor of the elector's chapel in Berlin, where he died. His works are songs, sacred cantatas, and chorales. He set to music the great national hymn of the Germans, *A Mighty Fortress is our God*, (Luther's *Ein feste Burg ist unser Gott*). Many collections of his songs are extant.

ECCE HOMO (Lat. "Behold the man"), the name usually given by artists to paintings representing Christ bound and crowned with thorns previous to his being led forth to crucifixion. On this exalted subject the highest efforts of art have been employed. The finest "Ecce Home" is that of Correggio, in the National Gallery, London; the whole conception of this remarkable picture being of the first order of genius. Other conceptions have been painted, such as that of Guido. See Dr. Waagen's *Art and Artists in England*.

ECCENTRIC, in machinery, is a contrivance for taking an alternating rectilinear motion from a revolving shaft. It consists of a circular disk or pulley, fixed on a shaft or axis which does *not* pass through the center of the disk. The disk has a groove upon its circumference in which the hoop—by means of which the rod is attached to the disk—slides. As the eccentric revolves with the axis, the hoop is alternately raised and lowered, and with it the rod which is keyed into it. The extent of the rise and fall of the rod is equal to twice the distance between the centers. The E. is chiefly used where a subsidiary motion of small power is required; as for working the force-pump that supplies the boiler of a steam-engine (q.v.).

ECCENTRIC, or ECCENTRIC CIRCLE (in the Ptolemaic astronomy). It was a fundamental doctrine with the ancient astronomers, that every heavenly body moved in a circle (the perfect figure), and at a uniform rate. To move otherwise than uniformly and in the perfect figure, would have been unbecoming a heavenly body! But some of them appeared to misbehave by moving unsteadily, and in other figures than circles. Of course, this was a mere deceptive appearance; but then, to save the fundamental doctrine, it must be explained. To explain it, they invented the *eccentric* circle. Suppose a body, such as the sun, to move in a circle at a uniform rate, and a spectator to observe it, not from the center of the circle, but from a point half way between the center and the circumference. Then it is evident that, by hypothesis, to an observer at the center of the circle, the motion of the sun is uniform; i.e., the sun travels through equal angular distances in equal times. When, however, the observer is located at the second point, the angular distances traveled through in equal times are unequal. If, then, the earth, instead of being at the center of the sun's orbit, be in a position away

from it, the want of regularity in his movements will be explained. Accordingly, to reconcile the observed fact with the fundamental doctrine, the ancients placed the earth at a point away from the center of the sun's supposed orbit. Hence this orbit was called the *eccentric*, in respect that its center did not coincide with that of the earth, which was considered as the center of the universe.

ECCENTRICITY. In the ellipse and hyperbola (q.v.), the E. is the ratio of half the distance between the foci to the semi-major axis. In older mathematical works, E. is sometimes used as the name of half the distance between the foci of an ellipse or hyperbola.

ECCHELLENSIS, or ECHELLENSIS, ABRAHAM, b. Syria, near the close of the 16th c.; educated in the Maronite college in Rome, and professor of Arabic and Syriac in the college of the Propagandists. In Paris, he assisted in the preparation of Le Jay's Polyglot Bible. He published several Latin translations of Arabic works, and was engaged in a controversy with Selden as to the historical grounds of episcopacy.

ECCHYMO'SIS (Gr. from *ek*, out of, and *chymos*, juice), a discoloration of the surface, produced by blood effused below, or in the texture of, the skin. It is usually attended by swelling to a greater or less extent, and is the result of injury. The presence of E. is sometimes adduced in courts of law as a proof of violent injuries having been inflicted during life, or very shortly after death. A question with respect to this was raised in the celebrated case of Burke and Hare, the West Port murderers in Edinburgh. E. may sometimes be diminished by applying cold cloths or a bladder of ice to the surface, in the case of injuries quite recently inflicted.

EC'CLESFIELD, a township in the West Riding of Yorkshire, 5 m. n. of Sheffield. Pop. '71, 15,171. The chief manufacture is cutlery, but flax, linen, and nails are also branches of industry. There are coal and iron mines in the vicinity.

ECCLE'SIA. I. The great assembly of the Athenians in which all free citizens might vote. Its authority was supreme, but, as in the growing power of the higher classes it was after a time seldom convened, the entire management of the state fell into the hands of the archons, who were chosen from the aristocratic classes. Solon (B.C. 594) ordained that it should meet monthly, on established days, and at other times when emergencies arose. It was convened by the *prytanes*, was presided over by the *epistates*, and, after it had been constituted by the offering of sacrifice and prayer, the *proedroi* announced the subjects for consideration, which had already been acted on by the senate, but required the consent of the people before they could become laws. Citizens who were over 50 years of age were first invited to speak; afterwards any one over 30 might be heard. The voting was by stretching forth the hands, or by depositing beans and stones in vessels prepared for them. When the business had been finished the prytanes dismissed the E. In Sparta, also, there were assemblies of the same name. One kind, composed only of citizens of Sparta itself, was called the little E. It met once a month, at first in the open air and afterwards in a building erected for the purpose. Any citizen over 30 years of age might speak. Another kind, called by way of eminence the E., was composed of the kings, senators, magistrates, and delegates from all the towns and cities of the province of Laconia. It had cognizance of all affairs of common interest and importance to the whole state. The voting at Sparta was by acclamation, and not by ballot. The majority was determined by the comparative volume of sound, or, if that was doubted, by a division and counting of the two parties. II. In the Greek of the New Testament, E. is the name for the company of Christ's disciples professing to trust in him as their Saviour and to obey him as their Lord. It is applied to a small assembly of them, such as were members of one family, or could meet in a dwelling-house of ordinary size; to the whole number in one city or neighborhood; to the whole number on earth; to all that are in heaven; and to the innumerable company on the earth and in the heavens.

ECCLESIAS'TES (Eng. the Preacher), the title (taken from the Septuagint) of a canonical book of the Old Testament; its Hebrew name is *Koheleth*, which signifies nearly the same. The inscription with which it commences is: "The words of Koheleth, the son of David, king in Jerusalem." Its authorship is commonly ascribed to Solomon. In support of this opinion, however, there is not a vestige of internal evidence except what arises from the dramatic use of his name, an expedient in all probability resorted to by the writer to give force and emphasis to his own reflections, inasmuch as Solomon was held by the Jews to be the perfection of human wisdom. The first who doubted the Solomonian authorship of the book was Grotius. Later critics have advanced further than Grotius. The actual writer probably flourished, according to Dr. Davidson, in the later period of the Persian government, not long after the time of Malachi, i.e., 350–340 B.C. Such is also substantially the opinion of Rosenmüller, Knobel, Ewald, and De Wette. Hengstenberg, unquestionably the ablest critic of the orthodox German school, considers that the contents of the book may best be explained by supposing the author to have lived in a period like that of Malachi, in which there prevailed a pharisaical self-righteousness, and melancholy murmurings against the providence of God. The dates assigned to it by Hartmann (viz., the period of the Maccabees) and by Hitzig (204 B.C.)

cannot well be sustained, as there is no trace in the book either of Grecian philosophy or language.

The chief arguments against the Solomonian authorship are *three*. 1. The writer indicates unconsciously his own posteriority in point of time by making Solomon say: "I *was* king over Israel in Jerusalem" (chap. i. verse 12); a thing which Solomon could *not* have said during his life, for he was king to the end of it. 2. The condition of the country in the time of the writer, the oppression, judicial injustice, the elevation of fools and slaves to high offices, etc., do not fit the reign of Solomon at all, nor any preceding period. 3. The language is post-exilian. Ewald, the greatest of recent orientalists, asserts that "the Hebrew is so strongly penetrated with Aramæan, that not only single often-recurring words are entirely Aramæan, but the foreign influence is infused into the finest veins of the language."—(Dr. Davidson in vol. ii. of Horne's *Introduction to the Holy Scripture.*)

It is extremely difficult to ascertain the stand-point of the author. He is deeply convinced that "all is vanity and vexation of spirit," but whether this conviction springs wholly from a religious view of life, or is in part caused by personal disappointments, we have not sufficient internal evidence to determine. There is much in E. that, if it stood by itself, might be thought to be a mere product of cynical epicureanism, but it is mixed up with so much that is nobler, with a faith in God that rises high above the crushing considerations of the vanity of all mortal life, and the book terminates so grandly, that it seems more reasonable to believe that the aim or intention of the writer was moral and religious, and not cynical; that he painted the folly, weakness, and helplessness of men in such strong colors, only that he might destroy their self-righteousness, and cure them of that inability to read the laws of God, which self-righteousness always produces. For what is the conclusion of the whole matter? "Fear God, and keep his commandments: for this is the whole duty of man."

ECCLESIAS'TES, Book of, consists of an introduction, a main body, and a conclusion. The introduction announces the theme that all things beneath the sun, if pursued as in themselves the chief end of man, and without reference to God and to immortality, are utterly vain. Man in such a pursuit, with all his high faculties, has less value and power than pertain to unconscious nature, for while it abideth he is quickly cut off; natural objects depart and return, in endless circuit, but man's life comes to an end and he is no more. The main body of the book establishes this proposition not by abstract reasoning, but by appeal to the actual experience of the human heart; and not among the poor, lowly, and ignorant, but among the wise, exalted, and rich. At the head of this class, in a Jew's esteem, would be the kings in Jerusalem, and among them all Solomon was most exalted. He, therefore, is introduced as revealing the feelings of his heart in the midst of his wisdom, wealth, and power. He had tried wisdom, pleasure, and every form of great achievement, and had found them vanity. Yet, by bringing God and the soul into the account, measures of happiness may be enjoyed. These the book proceeds to declare: 1. Happiness is attainable here in the enjoyment of the food which sustains life, and of labor as it is performed. But even this, man cannot secure by his own efforts alone. It must be the gift of God. He will bestow wisdom, knowledge, and joy on those who are good in his sight; but the activity and energy of sinners he will make advantageous to others rather than to themselves. 2. Riches, even when obtained through toil, cannot in themselves give happiness; for all enjoyment of the food which sustains life, and of the wealth which crowns it, is the gift of God, and from him must the rich obtain it, on the conditions which he prescribes, and in the measures which he bestows, or vanity and vexation will fill their souls. 3. As there are many circumstances of life in which wealth has no power to give happiness, as it is often lost after it has been acquired, and as many persons never possess it, happiness is to be found in the enjoyment of the food which sustains life, and in the possession of joy *in the soul*, independently of circumstances, whether of wealth or poverty, of success or failure, of obscurity or fame. This only can abide with man amidst all changes; and this, God who created the soul, and he only can supply. 4. Life, whatever its circumstances and experiences, comes to one inevitable end, in which all that is material shall return to the earth, and the spirit, the great gift of God, shall return to him. Preparation for this end, therefore, is the great object of life. If it be rightly made, life is a grand success, whatever its circumstances and transient experiences may be; if it be not made, life is an awful failure, whatever honor, wealth, or pleasure may have been secured. While these four propositions, linked together, are the golden thread which runs through the book, many particulars, drawn from personal observation and experience, are grouped around them. Some of these may be readily comprehended by any thoughtful mind; others, many persons can scarcely, if at all, understand. But this difficulty shows that the book is true to life; for while much of human experience is common to all men, and may therefore be understood by all, in other parts of it each heart knows its own bitterness and a stranger does not intermeddle with its joy. Every human soul, in its progress from folly to wisdom, or on its way back from transgression to righteousness, passes through phases of inconsistency, darkness, doubt, mystery, and wickedness, which, if faithfully recorded, would be incomprehensible to other minds. It is possible that some of the confusion which many find in the details of Ecclesiastes, is

of this sort. The conclusion of the book, repeating the declaration that human life, when pursued as if it contained within itself its highest end, is the vainest of vain things, adds a single rule for its guidance in all circumstances and in every age. The fear of God, securing obedience to his commandments in view of his appointed judgment to come, is all that is requisite to insure the righteousness, peace, and welfare of man.

Since the time of Luther, continental critics generally, including many who do not question the canonical authority of Ecclesiastes, have ascribed the authorship of it to some unknown writer who lived between B.C. 536 and 150, and, as they suppose, introduced Solomon as revealing his own experience and speaking as a representative of mankind. The reasons assigned for their opinion are: 1. That the book is written in Hebrew of a much later age than Solomon's, and contains many Aramaic words; 2. That many parts of the subject matter are not such as Solomon would have written. On the other hand, Jewish tradition from the earliest times has attributed the book to Solomon, saying that he wrote the song of songs in his youth, the proverbs in middle life, and Ecclesiastes in old age. Some modern scholars, whose thorough knowledge of Hebrew is unquestioned, stand resolutely by Jewish tradition; and some, who, perhaps, are not Hebrew scholars, are bold enough to say that since Solomon, in his later years, had constant conversation with foreign women, he may have corrupted his language with foreign words and idioms, so that the peculiarities of diction which are found in Ecclesiastes, instead of proving that he did not write the book, are only additional mementos of the transgressions which had made so much of his life more bitter than death.

ECCLESIASTICAL COMMISSIONERS FOR ENGLAND, "are a corporation with perpetual succession and a common seal, and with power to take, purchase, and hold real estate, notwithstanding the statutes of mortmain."—Burns' *Eccles. Law by Phillimore.* The ecclesiastical commissioners consist of all the bishops of England and Wales, the deans of Canterbury, St. Paul's, and Westminster, the two chief justices, the master of the rolls, the chief baron, and the judges of the prerogative and admiralty courts; and also nine lay members, seven to be appointed by the crown and two by the archbishop of Canterbury. The lay commissioners, including all the judges, to be members of the united church of England and Ireland. 6 and 7 Will. IV. c. 77, and 3 and 4 Vict. c. 113, down to 29 and 30 Vict. c. 111. The queen is empowered, by 13 and 14 Vict. c. 94, to appoint two, and the archbishop of Canterbury one (lay members of the church of England), by the title of church estates commissioners. The ecclesiastical commission thus constituted is the result of certain reports made by commissioners previously appointed by the crown. The object of the existing commission is best explained by a reference to the instructions given to the original commissioners. "To consider the state of the several dioceses of England and Wales, with reference to the amount of their revenues and the more equal distribution of episcopal duties, and the prevention of the necessity of attaching by commendam to bishoprics benefices with cure of souls; to consider also the state of the several cathedral and collegiate churches in England and Wales, with a view to the suggestion of such measures as may render them more conducive to the efficiency of the established church; and to devise the best mode of providing for the cure of souls, with special reference to the residence of the clergy on their respective benefices." The ecclesiastical commission was permanently established in the year 1835. In order that it should be provided with a fund to enable it to carry out such schemes as should appear to it desirable, the seven best endowed sees were laid under a contribution amounting in all to the annual sum of £22,800. In addition to the income thus provided, several canonries in the various cathedrals are abolished, and other ecclesiastical preferments are extinguished, and the emoluments of the whole are vested in the commissioners. The ecclesiastical commissioners are required to lay before her majesty in council such schemes as appear to them best adapted for carrying out the purposes of the act. It is provided that no proceeding which requires the common seal of the corporation is to be finally concluded, nor is the seal to be affixed to any deed, unless two at least of the episcopal commissioners are present, and consenting. Notice of every scheme is to be given to any corporation, aggregate or sole, affected thereby; and the objections, if any, are to be laid before her majesty in council, together with the scheme. The scheme, if it receive the royal assent, is to be gazetted, and thereupon acquires the power of an act of parliament. By 19 and 20 Vict. c. 55, the duties of the church building commissioners have been transferred to the ecclesiastical commissioners. The latter body have now, therefore, in addition to their previous powers, authority to divide or to unite existing parishes, and to create new districts. Such are, very briefly, the powers of the ecclesiastical commissioners. The policy which led to the appointment of that commission is not a subject for our consideration. But it is easy to see that the influence for good and evil of so powerful an institution, over the church of England, is enormous; and it cannot be matter of surprise that its proceedings are watched with scrupulous jealousy. As a result of its deliberations during 25 years of its existence, two new bishoprics have been created and endowed, and a considerable number of small livings had been augmented.

On the other hand, it must be observed that much indignation has been excited by the expenditure of very large sums on the purchase and improvement of episcopal residences. It is, no doubt, fitting that the episcopal office should be furnished with

appliances suitable to the position and dignity of a bishop; but the peculiar character of the revenues of the ecclesiastical commissioners must be borne in mind in applying those revenues. The funds of which they are composed have been violently diverted from the original purpose of the donors. Public necessity only can justify such an act. The plea put forward is the inequality of the revenues of the clergy, and the insufficient amount of the incomes of many benefices. But it may fairly be questioned whether it is a proper application of those funds to promote the convenience and luxury of those who are already liberally endowed.

ECCLESIASTICAL CORPORATION. The holder of an ecclesiastical benefice is, by the law of England, regarded as a corporation. Ecclesiastical corporations are divided into aggregate and sole. The former consist of several persons, as the head and fellows of a college, the dean and chapter of a cathedral, and are kept up by a continual succession of members. An ecclesiastical corporation sole consists of a single person and his successors in the benefice, as a bishop, a rector, a parson, or a vicar. The object of the common law, in thus regarding the incumbent of the benefice as a corporation sole, is to preserve the temporalities which are vested in him, and which would otherwise descend to his right heirs. The right of a rector or other corporation sole to the church and glebe, though said to be a freehold, is in fact little more than a tenancy for life. He is entitled to the full enjoyment of the benefice during his life, but he cannot sell it, and he is even punishable for waste. He may work mines or pits which he finds in use, but he is not entitled to open fresh mines. His right to timber is confined to felling it for repairs, but he is not entitled to sell it. See CORPORATION.

ECCLESIASTICAL COURTS are courts specially devoted to the consideration of matters relating to the clergy and to religion. For the origin of these courts we must go back to the first days of Christianity, when the early Christians, acting upon the injunction of St. Paul—"Dare any of you having a matter against another go to law, before the unbelievers and not before the saints"—had established courts, apart from those provided by the heathen governors, for the settlement of their own disputes. These courts were presided over by the bishops, who took cognizance of all matters, temporal as well as spiritual, arising among the brethren. As Christianity advanced and was acknowledged as the revelation of the Almighty, these bishops' courts acquired an independent position, and were suffered to exist concurrently with courts of civil jurisdiction (Code lib. i. tit. 4, *de episc. aud.*), and gradually special matters were assigned as the subjects of their peculiar jurisdiction—viz., questions of tithes, and matrimonial and testamentary causes.

All writers on the early constitution of England are agreed in the opinion that, in this kingdom, there existed no separate E. C. before the Norman conquest. Previous to that time, all matters, civil and spiritual, were in use to be heard before the county court, in which the bishop and the earl sat together. But by a charter of William I. a distinction was made for the first time between courts civil and ecclesiastical. By this charter, authority was given to the bishops to hear causes ecclesiastical according to the canon law. The bishops' courts having been thus established in England, they became a fruitful source of dispute between the crown and the see of Rome, the latter claiming supreme jurisdiction in appeal in all causes ecclesiastical. This claim was from time to time conceded by the weakness or necessity of individual sovereigns, to be as frequently retracted when the emergency was past; in particular, by 27 Ed. III. c. 1 and 16 Rich. II. c. 5, all persons were prohibited, under penalty of *præmunire* (q.v.), from resorting to the court of Rome or elsewhere. At the reformation, by 24 Hen. VIII. c. 12, on the recital that the king is, under God, the head of the church, and again, by 25 Hen. VIII. c. 21, the authority of the pope in matters ecclesiastical was finally excluded. In Bacon's Abridgment of the Law, there are enumerated ten E. C.—viz., convocation, the court of arches, the prerogative court, the court of audience, the court of faculties, the court of peculiars, the consistory court, the archdeacon's court, the court of delegates, and the court of commissioners of review. (For a full account of these courts, reference is made to the several heads, and also to the article DOCTORS' COMMONS.) Under the regulation of public worship act of 1874, a new ecclesiastical judgeship was called into existence, with cognizance mainly of offenses in the matter of ritual.

The chief E. C. which have at various times existed in Scotland are the general assembly, the commissary court, and the court of teinds. The former is the tribunal for the consideration of questions of doctrine and discipline according to the Presbyterian usage, and has existed since the reformation. See ASSEMBLY, GENERAL; COMMISSARY; TEINDS.

ECCLESIASTICAL HISTORY, in its widest range, is the history of religious organization among men, on the basis of divine revelation, from the creation to the end of the world. It is distinct from secular history; yet so inseparably connected with it, that one can never be fully understood without the other. Ecclesiastical history is divided into two great periods by the completion of the Scriptures as the inspired word of God. The first, extending from the creation to the end of the apostolic age, includes the days before the flood, the times of the patriarchs, of the exodus from Egypt, and the conquest of Canaan, of the kings and prophets, the captivity, restoration, and sub-

jection to Roman rule; the mission of John the Baptist, the advent, life, and work of Christ, and the apostolic founding and extension of the church. At the close of the apostolic age, ecclesiastical history, in its more restricted range, begins. It may be assigned in three great divisions:

I. ANCIENT CHRISTIANITY, from the death of the apostle John to Charlemagne, A.D. 100–800.

1. *The age of persecution;* to the accession of Constantine, 100–325. The principal part of the "ten" persecutions; testimony of the martyrs, confessors, and argumentative defenders of Christianity; beginning of monasticism; rise and progress of the hierarchy; extension of Christianity throughout the empire and beyond its bounds.

2. *The imperial age;* Constantine to Gregory I., 325–590. Influence of Christian emperors within the church; complete establishment of the hierarchy; Arian and Pelagian controversies; fall of paganism; missionary work of Patrick and Columba in the British isles; five general councils, Nicæa, 1st Constantinople, Ephesus, Chalcedon, 2d Constantinople.

3. *The age of Christian nationality* in Europe; Gregory I. to Charlemagne, 590–800. Evangelical British missions in France and Germany; Britain reappears as England, "*Angli or angeli;*" rise of Mohammed; the Saracens overrun Asia, Africa, and Spain, but are defeated in the west by Charles Martel; controversy and commotion concerning image worship and image breaking; temporal power of the pope granted by Pepin and confirmed by Charlemagne; Charlemagne crowned emperor by the pope.

II. MEDIÆVAL CHRISTIANITY, Charlemagne to Luther, 800–1517.

1. *Continued progress of Christianity;* Charlemagne to Hildebrand, 800–1049. Extension of the Latin church in the west and of the Greek in the north-east; progress of the papacy; rise of scholasticism.

2. *Supremacy of the papacy;* from Gregory VII. to Boniface VIII., 1073–1294. Contest between the pope and the emperor; celibacy of the clergy enjoined; the crusades; culmination of scholasticism; mysticism.

3. *Decline of the papacy;* Boniface VIII. to Luther, 1294–1517. The Scriptures forbidden to the laity; the inquisition founded; persecution of the Albigenses; transubstantiation and auricular confession established; reformatory councils of Pisa, Constance, and Basle; heralds of the reformation—Wycliffe in England, Huss in Bohemia, Wessel in Holland, Savonarola in Italy; capture of Constantinople; revival of letters; invention of printing; maritime adventure; discovery of America.

III. MODERN CHRISTIANITY; Luther to the present time, 1517–1880.

1. *Age of Protestant reform and papal reaction;* Luther to peace of Westphalia, 1517–1648. Protestant churches in Germany, France, Switzerland, England, Scotland, America; Puritans, Jesuits, Jansenists; massacre of St. Bartholomew; Protestants banished from Bohemia; thirty years' war; treaty of Westphalia promising religious toleration.

2. *Age of struggle for religious liberty;* peace of Westphalia to the French and English wars in America, 1648–1750. Flight of Huguenots from France; non-conformists driven from their livings in England; growth of Greek church in Russia; increase of Protestantism in American colonies.

3. *Age of revolution, conflict, and progress;* 1750–1880. American independence, with separation of church and state; French revolution from absolute monarchy through democracy and imperialism to a republic; general uprising of the people, and advance in civil and religious liberty; growth of the United States, war of the rebellion, abolition of slavery, revival of evangelical religion; conflict of Christianity with various forms of irreligion and secularism—English deism, French infidelity, German rationalism, materialism; free church of Scotland; disestablished churches in Ireland; growth of ritualism; papal infallibility declared; bible societies, steam navigation, railroads, telegraphs, journalism; improvement of common schools, colleges, technical schools; extension of Christianity over the world.

The SOURCES of ecclesiastical history are, first, *the written;* comprising acts of councils, creeds, liturgies, hymns, church laws, papal bulls, and encyclical letters, writings of the fathers, schoolmen, reformers, and anti-reformers; second, *the monumental,* including crosses, crucifixes, pictures, vestments, furniture, coins, churches, chapels; some of this class are partly written, as inscriptions on walls, pictures, tablets, and tombs. He who is thoroughly familiar with the imagery of the catacombs will sympathize more fully with the heart of the early church, during the period of persecution, than he would be able to do after the profoundest study of books alone. The basilicas, modeled after the grand secular edifices of Greece and Rome, illustrate the external enthronement of Christianity; the Byzantine churches record the splendor of the imperial age; the Gothic cathedrals are trophies of mediæval glory; those of the renaissance are memorials of the attempt to make pagan culture live again in Christian times. The ecclesiastical historian, besides general intelligence, culture, and learning, should possess the critical and judicial faculty, that he may discriminate between conflicting testimonies, and may interpret correctly the witness which he accepts. He should have an insight into speculative thought, metaphysical distinctions and ethical ideas; should be acquainted with human nature, scientifically and practically; should be in sympathy with the spirit of Christ, as exhibited in the New Testament, and have, in his inmost

being, an experience of spiritual truth. His style, in addition to all other attainable good qualities, should present a brilliant panorama rather than a lifeless schedule; should acquire a majesty worthy of the movement of the divine idea through the ages which he unfolds; and should throb with human sympathy as he narrates the endless story of sorrow and joy, fear and hope, spiritual death, and spiritual life.

ECCLESIASTICAL LAW. See CANON LAW.

ECCLESIASTICAL TITLES ASSUMPTION ACT (14 and 15 Vict. c. 60). In 1850, a ferment of Protestant zeal was awakened in this country by an edict issued by the court of Rome dividing Great Britain into territorial bishoprics, under an archbishop of Westminster. The brief was immediately followed by a pastoral by the newly appointed archbishop (cardinal Wiseman) "given out of the Flaminian gate." At the commencement of the parliamentary session of 1851, the subject of "papal aggression," and of the measures to be adopted to counteract it, superseded all other topics of interest. It was in these circumstances that lord John Russell introduced the ecclesiastical titles bill. By the act 10 Geo. IV. c. 7, it had been provided that the right and title of archbishops to their respective provinces, of bishops to their sees, and of deans to their deaneries, as well in England as in Ireland, having been settled and established by law, any person other than the person thereto entitled who should assume or use the name, style, or title of archbishop of any province, bishop of any bishopric, or dean of any deanery, in England or Ireland, should for every such offense forfeit £100. By the Roman Catholic party it was alleged that this enactment struck only at the titles to existing provinces and dioceses, and that though the pope could not create an archbishop of Canterbury, nor could his nominee assume that title without violating the law, there was no prohibition against the creation of an archbishop of Westminster. To meet this allegation, and remove the doubt which existed, the ecclesiastical titles act was passed, its object being to prohibit the assumption of such titles "in respect of any places within the United Kingdom." The penalty of £100 for every contravention of the act is to be recovered in accordance with the provisions of the former act, or at the suit of any person in one of her majesty's superior courts of law, with the consent of the attorney-general in England, or of the lord advocate in Scotland. The third section saves the episcopal bishops in Scotland from the operation of the act, providing, however, that "nothing herein contained shall be taken to give any right to any such bishop to assume or use any name, style, or title which he is not now by law entitled to assume or use." The passing of the act allayed the fears of the country on the subject of papal aggression; and though its provisions were not very steadily complied with in Ireland, no prosecution under it took place.

The Roman Catholic party having always considered the penal clauses of this act as a grievance, an arrangement was made for the repeal of the act. This was accomplished by the act 34 and 35 Vict. c. 53, which, after declaring that "no ecclesiastical title of honor or dignity derived from any see, province, diocese, or deanery recognized by law, or from any city, town, place, or territory within this realm, can be validly created," and that no "pre-eminence or coercive power can be conferred otherwise than under the authority of her majesty," repeals the ecclesiastical titles assumption act (14 and 15 Vict. c. 60) as inexpedient. The result is, that while no prosecution can now take place for assuming such titles, their assumption is still treated by the law as an illegal act.

ECCLESIASTICAL YEAR. See YEAR; also DATE.

ECCLESIAS'TICUS, the title of an apocryphal work, called in the Septuagint *The Wisdom of Jesus, the Son of Sirach*. It obtained the title of E., not because the writer was a priest (for regarding his profession nothing is known), but because it was, in the opinion of the fathers, the chief of those apocryphal works which they designated *ecclesiastici libri* (i. e., books not inspired, but which might be read in church for the edification of the people), to distinguish them from the canonical scriptures of the Old Testament. E. was originally composed in Aramaic; and the original text was apparently extant in the time of Jerome, who states that he had seen the Hebrew, but it is now lost. The author calls himself Jesus, the son of Sirach of Jerusalem; but when he flourished is not known. His book was translated into Greek, with an introduction by his grandson, who is usually, but not correctly, supposed to have had the same name as his grandfather. The date of the translation has been fixed as low as 130 B.C., and as high as 230 B.C. The former is the more probable. The contents of the work are not systematically arranged, so that we can only guess at what may be called the method and purpose of the thinking. The view taken of the mercy of God as extending to all mankind, indicates that the Jewish notions were breaking up; but still there is little to show that any great spirituality was taking its place. Its tone resembles that of the book of Proverbs. Exhortations to cheerfulness are constant; medicine, agriculture, etc., are highly praised; life is regarded from an ethical rather than from a religious point of view, and consequently "wisdom" is represented as the source of human happiness. The style of the w riter is at times noble, and even sublime; and, to use the langnage of Addison, "it would be regarded by our modern wits as one of the most shining tracts of morality that are extant, if it appeared under the name of Confucius or of any celebrated Grecian philosopher."

ECCLESIASTICUS, Book of (*ante*), the longest and one of the best books of the Apocrypha. Affixed to it are two prologues: the first, by an unknown author, states that the Jesus, son of Sirach, whose name is at the head of the book, lived in the latter times, after the people had returned home from the captivity; that his grandfather Jesus, a man of great diligence and wisdom among the Hebrews, having gathered the instructive and short sentences of the wise men who preceded him, and having himself uttered some full of wisdom and understanding, died, leaving the book almost finished; and that his son Sirach left it to his son Jesus, who set it in order and finished it, calling it *Wisdom:* the second prologue is by this Jesus son of Sirach, giving a similar account of the author, and adding concerning himself that he had thought it incumbent on him to translate and finish the book. The translation was made from the Hebrew, as this second prologue affirms; and Jerome testifies that he had seen a copy of the book in that language. Chap. I. contains a glowing eulogium on Simon the high-priest which implies that it was written after his death. And although there were two high-priests of that name, the grandeur of the description is appropriate only to the first, who died about 300 B.C. How long after that date the book was written, is not known. It was translated during the reign of Euergetes. But as two of the Ptolemies were well known by that surname, the precise date is not determined. The book, regarded by critics as almost incapable of analysis, because of the derangement and corruption of the text, may be summarized as to its teachings on important points. I. *Its main object*—as set forth by the name which the translator gave it—is to describe the true nature of *wisdom*, to exhibit its importance in all the employments and relations of life, and to exhort all men to seek it diligently. It is declared to come from God as its author, and to be in his Word as its fountain. It is the gift of God to those who love him, fear him, and do his commandments. In many respects the ideal of wisdom which the book presents is elevated and good, and its ideal of morality and piety is creditable, if judged by the standard of the time when it was written. Yet the wisdom scarcely equals that of the proverbs or of Job; and the morality falls short of the holiness which the Scriptures exhibit and enforce. II. *The character which it ascribes to God.* It declares him to be in his being from everlasting to everlasting, the creator of all things, greater than his most glorious works, infinite, almighty, omniscient, righteous, holy, greatly to be feared, compassionate, long-suffering, merciful, forgiving. III. *Its view of God's providential government.* It affirms that, sitting on his throne, he governs the world with the palm of his hand, and marking, with eyes ten thousand times brighter than the sun, the ways of men; humbling and exalting them according to his pleasure and their deserts; plucking up the proud nations and planting the lowly in their place; hating sin, visiting vengeance on the ungodly, and reserving them for the day of their punishment; regarding the prayer of the poor, and inflicting swift judgment on their oppressors; sending his blessing on children who honor their father, and his curse on those who provoke their mother; watching over them that love him as their mighty protector and strong stay. IV. *Does it teach anything concerning a future life?* Its general scope has regard to this life only. The advantages of wisdom and piety, of prayer, of morality and righteousness, are set forth constantly and in positive terms as bearing on this world, on youth, manhood, old age, and long life. The virtue and piety of fathers will make an honorable memorial for themselves, and will be beneficial to their children after them. But scarcely is there any reference to anything beyond death and the grave. There are few allusions, even, to the question whether there be a future life or not. Such passages as these exhibit the general view—"All things cannot be in men, because the son of man is not immortal." "The number of man's days at the most is 100 years; as a drop of water to the sea and a gravel stone to the sand, so are 1000 years to eternity." "Weep for the dead, for he hath lost the light; make little weeping for the dead, for he is at rest." "There is no inquisition in the grave, whether thou have lived 10 or 100 or 1000 years." Yet there are some exceptions which must be taken into the account in judging the book. Once it is said, "They that do the things which please the Lord shall receive the fruit of the tree of immortality." And once, "At the end of the way of sinners is the pit of hades." And when the historical characters of the Old Testament are reviewed and praised, it is said of Enoch, that "he pleased the Lord and was translated;" of Elias, that "he was taken up in a whirlwind and in a chariot of fiery horses;" and of Samuel, that "after his death he prophesied and showed the king his end." V. *Does it teach anything concerning atonement for sin and the promised Savior by whom the atonement was to be made?* It says of forgiveness, as the Lord Jesus afterwards taught, "Forgive thy neighbor the hurt that he hath done unto thee, so shall thy sins also be forgiven when thou prayest." Of atonement it says, as the Lord Jesus did not teach, "Whoso honoreth his father maketh atonement for his sins." "In the day of thy affliction the relieving of thy father shall be remembered, thy sins also shall melt away as ice in warm weather." It recognizes Aaron's consecration as a high-priest "to make reconciliation for his people," but gives no assurance of faith in a greater high-priest to come. It commends Isaiah as a great and faithful prophet, "comforting those that mourn in Zion, and showing what should come to pass forever;" but gives no intimation that among those future events there was the coming of a Savior to die for sinners and to make intercession for them. It quotes from Malachi the future mission of Elias, "to turn the heart of the fathers to the children;" but says nothing about the coming of the

Lord to his temple. Yet it does say that "the Lord gave a remnant to Jacob, and out of him a root unto David." It does say, "I will thank thee, O Lord my king, and praise thee, O God my Savior." And it contains the remarkable record, "*I called upon the Lord, the Father of my Lord,*" which, without attempting an interpretation of it, we may group with David's declaration, "The Lord said unto my Lord," and Paul's doxology, "Blessed be the God and Father of our Lord Jesus Christ." VI. *Its testimony to the historical character of the Old Testament Scriptures.* That the writer was familiar with the Old Testament, containing, substantially, the same books and the same things that it contains now, is manifest from his references to nearly all the prominent personages and principal scenes of its long history, from Adam to Zerubbabel. Yet two surprising omissions must be noted; there is no mention of Ezra by the side of Nehemiah, and no reference to Daniel.

ECCLESIOL'OGY, a word of recent use, is the name which has been given in the British islands to the study of church architecture and decoration. Besides discriminating the various styles of ecclesiastical architecture, E. takes account of the ground-plan and dimensions of a church; of its orientation, or the deviation of its line from the true east; of its apse, or circular or polygonal east end; of its altar or communion table, whether fixed or movable, stone or wood; of its reredos, dossel, or altar-screen; of its piscina, or basin and drain for pouring away the water in which the chalice was rinsed, or the priest washed his hands; of the sedilia, or seats for the priest, deacon, and subdeacon, during the celebration of the eucharist; of the aumbrye, or locker, for the preservation of the communion vessels and elements; of the "Easter sepulcher," or recess for the reception of the host from Good Friday till Easter day; of the altar-candlesticks; of the altar-steps; of the altar-rails; of the credence table, or shelf on which to place the communion elements before they were put upon the altar; of the "misereres," or elbowed stalls; of seats within and without the chancel walls; of the height of the chancel as compared with the nave; of the chancel arch; of the rood-screen, rood-staircase, rood-door, and rood-loft; of the piers or columns; of the triforium or blindstory; of the clerestory; of the windows; of the parvise-turret, or outside turret leading to the parvise; of the roof or groining; of the eagle-desks and lecturns; of the pulpit; of the hour-glass stand, by which the preacher was warned not to weary the patience of the flock; of the reading pew; of the benches, pews, and galleries; of the aisles; of the shrine, fertour, or reliquary; of the benatura, or holy-water stoup; of the corbels, with special reference to the head-dress figured on them; of the pavement; of the belfry; of the baptismal font, with its accessories, the baptistery, the steps, the kneeling-stone, the chrismatory, the cover, and the desk; of the tower, with its lantern, parapet, pinnacles, louvres, windows, buttresses, and bells; of the porch and doors, with their niches and seats; of the parvise, or priest's chamber above the porch; of the moldings; of the pinnacle crosses; of the gurgoyles, or rain-spouts; of the church-yard or village cross; of the church-yard yew; of the lych-gate, or corpse-gate, where the corpse was met by the priest; of the crypt; of the confessional; of the hagioscope, or opening in the chancel arch through which he elevation of the host might be seen; of the lychnoscope, or low window in the side-wall of the chancel, the use of which is uncertain; of the chest for alms; of the table of the ten commandments; of the church-plate; of the faldstool, or litany stool; of the embroidered work; of the images of saints; of the church well; of the sepulchral monuments and brasses, with their inscriptions; of the chapels or sacristies; of the vestry; of the dedication crosses. E. has a literature of its own, represented by such works as the *Handbook of English Ecclesiology* (Lond. 1847) of the "Ecclesiological Society;" Walcott's *Sacred Archæology;* Bourassé's *Dictionnaire d'Archéologie Sacrée,* and the like.

ÉCHELON (from the Fr. *échelle,* ladder) is such a formation or arrangement of troops that, if viewed from a height, they would present some analogy to the successive steps of a ladder or staircase. The several divisions of the force, although parallel, are no two on the same alignment. Each has its front clear of that in advance, so that, by marching directly forward, it can form line with it. There are two kinds of E., *direct* and *oblique. Direct* E. is adapted for attack and retreat; while *oblique* E. (oblique in reference to the original front of the line) is adapted for changing position, or for getting on the enemy's flank.

The word E. is also used in reference to nautical maneuvers. A fleet is sometimes said to be arranged *en échelon;* at which time it is compared by sir Howard Douglas to a body of infantry in a square, having its diagonal parallel with the front. In other words, it presents a wedge-form towards the enemy. Under this arrangement the bow-guns and broadsides of the several ships can mutually defend each other; the stronger parts of one ship defending the weaker parts of some other.

ÉCHEVIN, an officer in France of a rank existing from the days of Charlemagne to the revolution of 1789. His general functions were financial. In Paris, the échevins were assessors; and in some cases they had the authority of local magistrates.

ECHID'NA, a genus of quadrupeds peculiar to Australia, and belonging to the order *monotremata.* Two species have been described, differing in the scantiness and abundance of the hair, but it seems not improbable that they are mere states of the same species, perhaps depending on the seasons or on age. The E. is about the size of a

hedgehog, and, like that animal, is covered with spines; which, however, are much larger and stronger, and are placed among soft silky chestnut-colored hair. Its head is small, the muzzle much elongated and slender, terminating in a small mouth, which is destitute of teeth, but furnished with several rows of small spines upon the palate, directed backwards. The tongue is extensile, and is used, like that of ant-eaters, for catching ants, the ordinary food of the animal. The tail is very short. The legs are also very short, each foot furnished with five large broad claws, fit for digging and burrowing, the claws of the hind feet being concave, and directed backwards and outwards, so as to form very efficient shovels for throwing out the earth. The E. burrows with great rapidity, being possessed of strength perhaps greater in proportion to its size than that of any other quadruped. When it cannot more completely disappear under the earth, it inters itself so far as to present only its spiny back to an assailant. The E. is capable of very long abstinence, and confines itself to its burrow during droughts. In confinement, it may be fed on milk, hard-boiled eggs, etc.

ECHIMYD, *Echimys*, a genus of rodent quadrupeds, in some of their characters agreeing with dormice, but differing from them in having the tail scaly, and the fur coarse and mingled with flattened spines. They are all South American. Some of them are known as spiny rats. They display considerable beauty of color. One species excavates long burrows in the ground.

ECHIN'ADES, islands in the Ionian sea, around the entrance to the gulf of Corinth. They were said to have been formed by drifts from the river Achelous. They are now called the Curzolari islands, and are of little importance. Homer says they were inhabited, but later authors report otherwise. There are at present a few small villages on them. The battle of Lepanto was fought off these islands, Oct. 7, 1571.

ECHINEIS. See REMORA.

ECHINIDÆ, a family of *echinodermata*, the species of which are popularly known as sea-urchins, sea-eggs, etc. They have the body covered with a calcareous crust or shell, of an extremely porous structure (and thus differing very widely from the shells of mollusks), in polygonal plates nicely adapted to each other, and increasing by additions to the edges of each plate, so that the shell may enlarge with the enlargement of the animal, whilst new plates are also added around the superior orifice. The shell is pierced with rows of holes for the ambulacra (q.v.), and is externally covered in a living state with a membrane—sometimes very delicate, sometimes thick and spongy—which communicates by many delicate processes with the interior, and unites the bases of all the spines. The spines differ very much in the different genera and species, in their length, strength, number, and arrangement; they are attached to tubercles on the surface of the shell, by cup-like bases capable of working upon the tubercles, in the manner of a ball-and-socket joint; and they are moved by means of the connecting membrane so as to be employed in locomotion. In some species, they seem to be the principal organs of locomotion; in others, the ambulacra are so. By means of the spines, some, in which they are few and strong, can walk even on dry ground; others, in which they are minute and very numerous, employ them in burying themselves in the sand. The mouth of the E. is situated at the lower orifice of the shell, and is generally furnished with five flat calcareous teeth, moved by a very complex apparatus of bony sockets and muscles—"a very powerful mill" for grinding down their food, which is supposed to consist of small crustaceans and mollusks. The intestine is long and spiral; the vent, in the E. of most regular form, is at the upper end of the shell, exactly opposite the mouth; in others, in which there is a departure from the characteristic orbicular form, it is more or less lateral. The E. abound in all seas, and seem to have abounded still more in former geological periods. "Of all the *radiata*, they are most perfectly preserved in a fossil state," and the knowledge of their habits and organization is necessary to the geologist, "in order to understand the relations and associations of the numerous species which abound in many of the earth's strata."—Forbes.

ECHINOCOC'CUS. See TAPE-WORM.

ECHINODER'MATA (Gr. spiny-skinned), a class of radiate animals, the highest in organization of that great division of the animal kingdom. They have a digestive and a vascular system; for the former, however, there is in many of them only a single orifice; a circular and radiating nervous system has been observed in many; they are especially characterized by their well-organized skin, which in many is strengthened by calcareous plates, and in some also has the additional protection of numerous long spines. *Echinidæ* (sea-urchins) exhibit these characteristics in greatest perfection. *Asteriadæ* (star-fishes), *ophiuridæ* (brittle-stars), *crinoideæ*, *holothuridæ* (sea-slugs, sea-cucumbers, etc.), and *sipunculidæ*, are also ranked among the E., and have been variously arranged in orders by different naturalists. Spines are wanting in most of them; in some (*holothuridæ* and *sipunculidæ*), there are not even calcareous plates, and there is no inconsiderable departure from the ordinary and perfect radiate form, an approach being made to the forms of mollusks and worms, whilst yet the accordance with the other E. is very perfect in other parts of the organization. Almost all the E. are free, moving about at the bottom of the sea; some of them—at least in an immature state—are stalked and fixed. They are provided with "an apparatus for water circulation," a peculiar charac-

teristic of radiate animals, and which "can scarcely be said to exist in any of the other types." By means of this it is that they fill and fit for use the suckers or *ambulacra* (q.v.) with which most of them are provided, but of which the *sipunculidæ* are destitute. The spines as well as the ambulacra of the E. are used by those which possess them (*echinidæ* and *ophiuridæ*) as organs of locomotion.—The British E. are described by Dr. Edward Forbes in an interesting work, entitled *A History of British Star-fishes and other Animals of the Class Echinodermata* (Lond. 1841).

ECHI'NUS, of Vitruvius, is a classical molding in the form of a series of eggs, whence it is also called the ovolo or egg-molding. The eggs are sometimes divided by an anchor or dart. The type of this ornament is sometimes said to have been the chestnut and shell.

ECHI'NUS, a genus of the order *echinodermata*, known as sea-urchins, found along the American coast. The common echinus of the Atlantic coast is about an inch in diameter; but some kinds are three or four times as much. They have globe shaped cases, flat on the lower side, formed of calcareous plates, covered on the outside with movable spines from 1 to 5 in. long. With the aid of the spines and a great number of feet with suckers at the ends, the animal rolls slowly over the bottom, or clings to neighboring objects. They bore holes in the hardest rocks, where they make their homes, increasing the cavities as they grow, but not the opening, and so are often prisoners for life. Some species bury themselves in the sand near the water. In tropical climates some of the largest are used for food.

E'CHIUM. See VIPER'S BUGLOSS.

ECHMIEDZIN'. See ETCHMIADZIN.

ECHO (Gr. *sound*). Sound is produced by waves or pulses of the air; when such a wave comes against a wall or other opposing surface, it is reflected like light, and proceeds in another direction, and the sound so heard is an echo. Even the surface of a cloud suffices to reflect sound, as may be observed during thunder and the discharge of cannon. That the echo of a sound may return to the point where the sound originated, the reflecting surface must be at right angles to a line drawn to it from that point. Oblique walls send the echoes of a person's voice off in another direction, so that they may be heard by others, though not by him. In order to echo words distinctly, the reflecting surface must on the whole be even, or so curved as to resemble a concave mirror. This last form is necessary for returning a distinct sound when the distance is considerable. A great degree of evenness, however, is not essential, as it is no uncommon thing for the edge of a wood to return an echo. The distance of the reflecting surface must also be such as to allow a sufficient time to elapse between the sound and the return of the echo for the ear to distinguish them; when they succeed too closely, they merge into one. An interval of about $\frac{1}{9}$ of a second is necessary to discriminate two successive sounds; so that if we assume 1125 ft. as the distance traversed by sound in a second, $\frac{1}{18}$ of 1125, or 62 ft., will be the least distance at which an echo can be heard, as the sound will go that distance and return in $\frac{1}{9}$ of a second. If the distance is less, the echo only clouds the original sound, but is not heard distinct. It is these indistinct echoes that interfere with hearing in churches and other large buildings (see ACOUSTICS); hence anything that breaks the evenness and continuity of the reflecting surfaces is an improvement in this respect. The number of syllables that any particular echo will repeat, depends upon how many can be uttered in the time that the sound takes to go and return from the reflecting surface. The echo at the tomb of Metella, in the Campagna, near Rome, of which Gassendi speaks as repeating a hexameter line requiring $2\frac{1}{2}$ seconds to utter it, must therefore come from a distance of about 1500 feet. Such echoes are rare, as the various conditions are seldom all fulfilled. When there happen to be several reflecting surfaces at different distances in the direction of the sound, with a sufficient interval between them, each gives a separate and distinct echo. A similar effect is produced when two surfaces are inclined to each other in such a way as to give repeated reflections of the sound from the one to the other like the mirrors of a kaleidoscope, thus multiplying echoes of echoes. To this multiple and repeating class belong the famous echoes of Killarney, and that produced between the wings of the castle of Simonetta, near Milan, which repeats the report of a pistol 60 times.

ECHO, in music, is the repetition of a melodic phrase, frequently written for the organ, on account of the facility with which it can be produced by the stops.

ECHO, in Grecian mythology, one of the Oreades, or mountain nymphs. The name denotes sound in the abstract. Echo could not speak until spoken to—a punishment inflicted upon her by Juno, who was detained by Echo's talkativeness while Juno was hunting among the Oreades for her truant Jupiter. A further legend is that Echo fell in love with Narcissus; but as he did not respond, she wasted away with grief until nothing but her voice remained; whereupon Nemesis punished the fickle Narcissus by causing him to fall in love with himself.

ECHO CAÑON, a deep ravine in Utah, near the Union Pacific railroad; 975 m. w. of Omaha. The sides are of rock, bare, and almost vertical in position. The scenery is remarkably beautiful and sublime.

ECHOLS, a co. in s. Georgia, bordering on Florida, intersected by a branch of the Atlantic and Gulf railroad, and the Allapaha river; 400 sq.m.; pop. '70, 1978—465 colored. The surface is level and the soil sandy. Productions, corn, cotton, etc. Co. seat, Statenville.

E'CIJA, a city of Spain, Andalusia, in the province of Seville, and 45 m. e.n.e. of the town of that name, is situated on the left bank of the Jenil, in lat. 37° 33′ n., long. 5° 8′ west. It is surrounded by gardens, and stands in the center of a district fertile in corn and oil. E. is a well-built and prosperous town. On account of the heat of the climate, this town is called by the Spaniards the oven of Andalusia. E. has many pleasant alamedas (public promenades), shaded by trees, and adorned with statues and fountains; the principal promenade is that which stretches along the banks of the river. Pop. 24,000. E. was called in ancient times *Astigis*, and was one of the chief cities of the Roman province of Hispania Bœtica; its origin is unknown. It is said to have been visited by the apostle Paul, a gilt statue of whom may be seen in the city. E. was called *Colonia Augusta Firma* by the Romans, and abounds in Roman antiquities. It also presents several specimens of Moorish architecture in the shape of gates and massive towers.

ECK, JOHANN MAYR VON, the well-known adversary of Luther, was b. in 1486 at Eck, a village in Suabia, where his father, Michael Mayr, was a peasant, and afterwards a bailiff. Endowed with considerable ability, young E. commenced at an early period the study of the church fathers and the scholastics, and acquired a great skill in theological disputation. In 1518, when his *Obelisci* appeared in opposition to Luther's *Theses*, he was doctor of theology, canon of Eichstädt, and pro-chancellor of the university of Ingolstadt. The publication of his *Obelisci* involved him in a disputation with Karlstadt, which lasted from the 27th June to the 16th July, 1519. The only effect of the disputation on the people was to make them wonder at E.'s volubility; but having impugned some of Luther's views in the course of his disputation, he was assailed by the great reformer, and by Melanchthon. E. nicknamed his opponents *Lutherans*, and instigated partly by personal hatred, and partly by Fugger (q.v.), went to Rome in 1520, to induce the pope to take strong measures against Luther. He returned with a papal bull of condemnation in his pocket, but the people in many places stood by Luther; and at Leipsic, in particular, E. was so roughly received, that he had to take refuge in the monastery of St. Paul's. Later we find him at the Augsburg diet of 1530, where he let slip out the memorable statement, that "with the church fathers, he would venture to oppose the Augsburg confession, but not with the Scriptures." In the religious convocations held at Worms in 1540, and at Ratisbon in 1541, he also took part. He died in 1543. A desire to shine and to play an important part in the affairs of men, coupled with a strong love of lucre, were the leading features of his character. Though an extremely learned ecclesiastic, he had no great talent, but was loud, boisterous, and full of assurance.

ECK'ERMANN, JOHANN PETER, well known to the literary world through his intercourse with Goethe, was b. in 1792, at Winsen on the Luhe, in Hanover, studied, 1821–23, at Göttingen, and afterwards went to Weimar, where he took part in the *rédaction* of the last volume of Goethe's *Sämmtliche Werke*. At the same time, he commenced to contribute articles to the *Morgenblatt*, on art and antiquity. In 1827, the university of Jena conferred on him the degree of PH.D. Two years later, he was appointed to superintend the studies of the heir to the grand duchy of Weimar, in the German and English languages and literature. In 1830, he traveled with Goethe's son in Italy, and on the death of the patriarch of German literature, he edited his posthumous writings. During the years 1839–40, he edited a new edition of Goethe's *Sämmtliche Werke*, in 40 vols. But E. is most widely and favorably known by his *Gespräche mit Goethe* (Conversations with Goethe). The greater part of these *Gespräche* appeared at Leipsic in 1836, the remainder at Magdeburg in 1848. It cannot be said with truth that E. has done for Goethe what Boswell did for Johnson, because Goethe did not require this. Johnson's writings give us but a faint idea of the man; hence Boswell's *Life* looks like a revelation; whereas there was the most perfect harmony in Goethe between the man and the author. Still, E.'s book is of immense value, just because it shows us this harmony, giving us, as it does, a picture of Goethe in his manifold social and literary relations, and exhibiting to us the simple, natural, and noble principles on which he studied and wrote. The *Gespräche* have been translated into all European languages, even into Turkish. The best English translation is that by John Oxenford (Lond. 1850). E. died at Weimar, 3d Dec., 1854.

ECKFORD, HENRY, b. Scotland, 1775; d. Constantinople, 1832. He was one of the earliest of the famous shipbuilders of New York. In 1812, during the war with England, he built a fleet of vessels for service on the lakes. He was the builder of the *Robert Fulton* which made the voyage by steam to Havana and New Orleans. In 1820, he was naval constructor at Brooklyn, and built six ships of the line. Afterwards he built many ships for foreign powers. In 1831, he built a man-of-war for Mahmoud, the sultan of Turkey, and visited that country to organize a navy-yard.

ECKHART, JOHANNES, generally called MEISTER (master) ECKHART, lived in the latter part of the 13th and beginning of the 14th c.; b. probably about 1250. He was

of the Dominican order, and for some time professor in a college in Paris. Boniface VIII. called him to Rome to assist in the controversy between the pope and Philip of France. In 1304, he was provincial of his order for Saxony, and in 1307, vicar-general of Bohemia. He was distinguished for practical reforms, and for his power as a preacher. He systematized and expounded the fundamental notions of the Beghards (q.v.) and Brethren of the Free Spirit. The opponents of the Beghards found some propositions in Eckhart's works for which he was called to account by the inquisition at Cologne. He made a conditional recantation, and appealed to the pope, by whom some of his propositions were formally condemned. About the time of the issuing of this condemnation, Eckhart died. His works show that he was deeply learned in all the philosophy of the time, and one of the profoundest thinkers of all time. His style is without system, brief, mystical, and full of symbolical expressions; but his thinking was clear, calm, and logical; and he gave the most complete exposition of what may be called Christian pantheism. The starting point of his doctrine is that, apart from God, there is no real being. But, in his view, God is the unknown. He conceives of the Godhead, as without any thing that can be affirmed concerning it. Any thing definitely ascribed to it would limit and therefore destroy its infinity. The Godhead is not God as known to us. From it proceeds the triune God, who is known. The *essence* of the Godhead is what it is in itself; its *nature* is that which it becomes as an object for others. It reveals itself in the personal God, the Father. The Son is the word or expression through and in which the Father becomes self-conscious. The Father eternally begets the Son, and the Son's return into the Father in love and mutual will is the Spirit. The Father is not before the Son; only through the begetting of the Son, only through arriving at self-consciousness, does he become the Father. The genesis of the Son from the Father involves also the production of the world of things; for God is reason, and in reason is contained the ideal world of creatures. In the Son all things are made in ideal form. As all things have arisen from God, so they all tend to return to him. Repose in him is the end of all things; and in man, the noblest of creatures, this end is realized. In him, specially, there is the power of reaching to the absolute, the ground both of God and the universe. This power—which E. called *the spark*—is in truth God working in man. In cognition of God, God and man are one; there is no distinction of knower and known. Union with God—the birth of the Son in the soul—is the ultimate end of activity and is to be attained by resigning all individuality. When this is reached the soul is one with God; its will is God's; it cannot sin. Yet all this applies only to the "spark" in the soul, the other powers of which may be properly employed about other things. Thus, the way is left open to adjust the balance between feeling and action; between philosophical theory and practical life. In Eckhart's theories appear at least the elements of some modern metaphysical speculations.

ECKHUNG' CHOO, a river of Thibet, is supposed to be the head stream of the Indus. It rises on the n. side of the Himalaya, near the sources of the Sutlej. The actual locality of its sources has been assigned to the Kailas mountains, in lat. 31° 25′ n., and long. 81° 40′ east. Flowing to the n.w., E. C. reaches long. 79° e. before it assumes the name of Indus.

ECK'MÜHL, a village on the Laber, in Bavaria, notable for the battle fought there, on the 22d April, 1809, between 75,000 French and 40,000 Austrians. The archduke Charles had taken up his position on the right bank of the Danube, near Eckmühl. From this point, at the head of four divisions of the Austrian army, he threatened Napoleon, and hoped to gain possession of the road to Donauwörth, the occupation of which would have decided the fate of Bavaria. This was prevented by Davout, who, moreover, by repeated attacks, contrived to keep the archduke in ignorance of Napoleon's designs. The plan of the latter was to cut off the Austrians from their whole remaining communications with the Iser and Inn, and by throwing them back upon Ratisbon and Bohemia, as their only line of retreat, to sever them entirely from the support and protection of Vienna. On the 22d, Napoleon suddenly appeared, with his army, opposite the village of Eckmühl. The action, on the side of the French, was commenced by Lannes, who drove back the Austrain left, while, at the same time, the village of E. was stormed by the Würtembergers. Shortly after, the high grounds between E. and Laichling, also occupied by the Austrians, were abandoned after a heroic struggle, and the archduke ordered a retreat on Ratisbon, which was admirably executed, though the defeated army was harassed by sixteen cavalry regiments. During the retreat, a magnificent and thrilling encounter took place at Eglofsheim between the French and Austrian cuirassiers, which, though it ended fatally for the latter, was largely instrumental in securing the retreat of the main body of the Austrian army. The Austrians had 5,000 men killed and wounded, and 7,000 taken prisoners, besides losing 12 standards and 16 pieces of cannon. The French loss was considerably less.

ECLAMP'SIA (Gr. *ek*, and *lambanō*—Ion. fut. *lampsomai*—I seize hold of), a somewhat pedantic and unnecessary technical term for convulsion (q.v.).

ECLEC'TICS, ECLEC'TICISM. Eclectics was the name given in ancient times to those philosophers who had no determinate system of their own, but who professed to choose (*eklegein*) from all systems the parts that they considered true. The systems from which the selections were originally made were those of Pythagoras, Plato, and Aristotle, but

ultimately eclecticism lapsed into an attempt to reconcile Platonism and Christianity. The chief representatives of this school were Plotinus and Proclus, who, however, did not so much make up a compound of doctrines gathered from without, as set up a view that endeavored to unite the results of previous systems into a consistent whole. Many of the early fathers of the Christian church who had been educated in the pagan schools of philosophy and rhetoric, and retained a fondness for their early studies, were E., such as Clemens Alexandrinus and Synesius of Cyrene. Modern eclecticism is conceived by some to have originated with Bacon and Descartes, but Hegel may be more properly considered its founder. In his *Philosophy of History* and other works, he endeavors, among other things, to point out the true and false tendencies of philosophic speculation in the various ages of the world; but it is to the lucid and brilliant eloquence of Victor Cousin (q.v.) that modern eclecticism owes its popularity. This system, if it can be so called, may best be defined as an effort to expound, in a critical and sympathetic spirit, the previous systems of philosophy. Its aim is to apprehend the speculative thinking of past ages in its historical development, and it is the opinion of some that such a method is the only one possible in our day in the region of metaphysics.

ECLIPSA'REON, the name given by Ferguson, the astronomer, to a contrivance which he invented for exhibiting the time, quantity, duration, and progress of solar eclipses.

ECLIPSES. An eclipse is an obscuration of one of the heavenly bodies by the interposition of another, either between it and the spectator, or between it and the sun. The causes of E., as suggested in this definition, are so simple and familiar, that it is difficult for us to imagine how deeply E. affected men's minds before the dawn of astronomical science. To the ancients, they were without the order of nature—terrible presages of dire events; and at Rome, at one time, it was blasphemy, and punished by law, to talk publicly of their being due to natural causes. So strong a hold had this superstition on the popular mind, that even after it came to be generally believed that E. of the sun were caused by the moon coming betwixt us and that orb, E. of the moon were still referred to supernatural agency. When the moon was in eclipse, the people turned out and made a great noise with brazen instruments—the idea being, that by doing so they gave her ease in her affliction. According to some, Luna, when in eclipse, was in the pains of labor; according to others, she was suffering from the arts of wicked magicians. Similar notions have prevailed among all barbarian tribes. The Chinese, it is well known, imagine E. to be caused by great dragons trying to devour the sun and moon, and accordingly they beat drums and brass kettles to terrify the monsters into letting go their prey. Several stories are told of these popular superstitions being turned to good account by knowing persons; among which are those which represent Thales as bringing about peace between the Medes and Lydians; and Columbus, when in a great strait, procuring provisions from the natives of Jamaica through the prediction of eclipses.

Stars, planets, and the satellites of planets, may suffer eclipse. The principal E., however, are those of the sun and moon, called the solar and lunar eclipses. The transits of the lower planets over the face of the sun are partial solar E.; but solar E., properly so called, are those caused by the interposition of the moon between the sun and earth. Regarding solar E., it is observed that they happen always at the time of new moon, when the sun and moon are in conjunction, i.e., on the same side of the earth. In a partial eclipse, the sun's disk suddenly loses its circular form; it becomes indented on one side, the indentation slowly increasing for some time, and then diminishing until it disappears altogether. In a total eclipse, the indentation goes on increasing till the whole orb for a time disappears; after a short interval, the sun reappears again, passing through the same phases of obscuration in an inverse order. In an annular eclipse, the whole orb is obscured except a ring or annulus. Lunar E., again, it is observed, happen always at full moon, or when the sun and moon are in opposition, or on opposite sides of the earth, and are caused by the moon passing through the earth's shadow. Such E. are sometimes partial, and sometimes total, but never annular, and in their general phases they resemble those of the sun.

In speaking of E., we shall have occasion to use certain terms, which we shall now define. The *duration* of an eclipse is the time of its continuance, or the interval between immersion and emersion. *Immersion* or incidence of an eclipse is the moment when part of the luminary begins to be obscured; *emersion* or *expurgation* is the time when the luminary begins to reappear or emerge from the shadow. When the quantity of an eclipse is mentioned, the part of the luminary obscured is intended. To determine this part, it is usual to divide the diameter of the orb into twelve *digits;* and the eclipse is said to be of so many digits, according to the number of them contained in that part of the diameter which is obscured.

Having given this general explanation of the facts of observation on which the theory of E. turns, and of the language employed in speaking of them, we now proceed briefly to explain the theory itself, and how it is possible to predict the time of occurrence, and the duration and quantity of eclipses.

1. *Eclipses of the Moon.*—It has been said that these are caused by the moon passing through the earth's shadow. Before this explanation can be accepted, it must be shown that that shadow extends as far as the moon. This is easily done. Supposing

the earth to have no atmosphere, then the shadow is the cone marked in shade in fig. 1, whose apex is at O; and the question is, whether the distance OT from the apex to the earth's center exceeds the moon's average distance from the earth. Drawing TB, SA, from the centers of the earth and sun respectively, perpendicular to the line OBA, touching both spheres, and the line TC parallel to the line OBA, we have from the similar triangles OTB, TSC, the proportion OT : TB : : TS : SC. Now, we know that TS, the (mean) distance of the sun, is equal to about 24,000 times TB; also, from the construction, AC = TB; and we know that SA = 112 times TB, whence it follows that SC = 111 times TB. The above proportion, then, gives OT = 216 times TB, since $\frac{24000}{111}$ = 216 nearly. But the moon's average distance is only 60 times TB (the earth's radius). Hence it appears that the length of the earth's shadow is almost four times the average distance of the moon, and that the moon can enter it. Further, it is clear that, should it do so, it may be totally obscured; for it must enter at a point much nearer T than half the distance OT, which is 108 times TB; and everywhere within that distance it might be shown the breadth of the shadow is much greater than the moon's disk. But one consideration now remains to be stated to complete the proof of the theory of lunar eclipses. It was mentioned that they only occur at full moon, and we know that to be the only time when the earth is between the sun and moon, and so *has a chance* of throwing her shadow upon it. Why they do not occur every full moon, will be explained in treating of the prediction of eclipses.

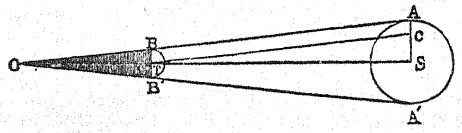

Fig. 1.

In the foregoing explanation, we proceeded on the assumption that the earth has no atmosphere. If the assumption were correct, the earth's shadow would be darker and narrower than it is, and the phenomena of E. shorter in duration, but more striking. The effect of the atmospheric refraction (see REFRACTION) is to bend the rays which are incident on the atmosphere in towards the axis of the cone of the earth's shadow, those which pass through the lowest strata of the air being most refracted, and converging to a point in the line OT (see fig. 1), at a distance equal 42 radii of the earth from the earth's center. Accordingly, the moon, which, as we have seen, crosses the shadow at a distance of about 60 radii, never enters that part of it which is completely dark; thus, she never loses her light entirely, but appears of a distinct reddish color resembling tarnished copper—an appearance caused by the atmospheric refraction, in the same way as the ruddy color of the clouds at sunset. There is another reason why the phenomena of a lunar eclipse are less striking than, from the explanation given relative to fig. 1, might be expected. Every shadow cast by the sun's rays necessarily has a penumbra, or envelope, on both sides of the half-shadow. In the case before us (fig. 2), suppose a cone having its apex O' between the sun and earth, and enveloping each of them respectively in its opposite halves, CO'C' and AO'A' (fig. 2). It is clear that from every point in the shaded part of the cone CO'C', and without the shadow BOB', a portion of the sun will be visible—and a portion only—the portion increasing as the point approaches either of the lines CB, C'B; and diminishing as it approaches the lines BO, B'O. In other words, the illumination from the sun's rays is only partial within the space referred to, and diminishes from its extreme boundary lines towards the lines BO, B'O. When, then, the moon is about to suffer eclipse, it first loses brightness on entering this penumbra; so that when it enters the real shadow, the contrast is not between one part of it in shade and the other in full brilliancy, but between a part in shade and a part in partial shade. On its emersion, the same contrast is presented between the part in the umbra and the part in the penumbra. What we should expect on this geometric view of the earth's shadow, actually happens. From the breadth of the penumbra, it happens that the moon may fall wholly within it before immersion in the umbra commences; and so softly do the degrees of light shade into one another, that it is impossible to tell when any remarkable point on the moon's surface leaves the penumbra to pass into the umbra, or the reverse.

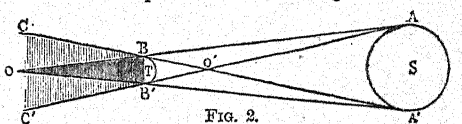

FIG. 2.

2. *Prediction of Lunar Eclipses.*—We said that lunar E. only happen at full moon. They do not happen every full moon, because the moon's orbit is inclined to the ecliptic, on which the center of the earth's shadow moves at at angle of 5° 9′ nearly. Of course, if the moon moved on the ecliptic, there would be an eclipse every full moon; but from the magnitude of the angle of inclination of her orbit to the ecliptic, an eclipse can only occur on a full moon happening when the moon is at or near one of her nodes, or the points where her orbit intersects the ecliptic. An eclipse clearly can happen only when the centers of the circle of the earth's shadow and of the moon's disk approach within a distance less than the sum of their apparent semi-diameters; and this sum is very small; so that except when near the nodes, the moon, on whichever side of the ecliptic she may be, may pass above or below the shadow without enter-

ing it in the least. The moon's average diameter is known to be 31′ 25″.7, and from the *Nautical Almanac* we may ascertain its exact amount for any hour—its variations all taking place between the values 29′ 22″ and 33′ 28″. As for the diameter of the circle of the shadow, it is easily found by geometric construction and calculation, and is shown to vary between 1° 15′ 32″ and 1° 31′ 36″; and its value for any time may be found from the *Nautical Almanac*, to which value astronomers usually add 1′ as a correction for its calculation proceeding on the assumption that the earth has no atmosphere. Starting from these elements, it is a simple problem in spherical trigonometry—which may be solved approximately by plane trigonometry by supposing the moon and the earth's shadow to move for a short time near the node in straight lines—to fix the limits within which the shadow and moon must concur to allow of an eclipse. Recollecting that the earth's shadow on the ecliptic is at the opposite end of the diameter from the sun, and that therefore as it nears one node the sun must approach the other—the sun and shadow being always equidistant from the opposite nodes—we find, from the solution of the above problem: 1. That if, at the time of full moon, the distance of the sun's center from the nearest node be greater than 12° 3′, there cannot be an eclipse. 2. If at that time the distance of the sun's center from the nearest node be less than 9° 31′, there will certainly be an eclipse. 3. If the distance of the sun's center from a node be between these values, it is doubtful whether there will be an eclipse, and a detailed calculation must be resorted to, to ascertain whether there will be one or not. Into the nature of that calculation we shall not attempt here to enter; suffice it to say that, knowing from the *Nautical Almanac* the true time of the sun and moon being in opposition, the true distance of the moon from the node at the time of mean opposition, with the true place of the sun at that time, as well as the moon's latitude, we may, by means of these elements, combined with the obliquity of the moon's path and her motion relative to that of the sun, not only fix whether there shall be an eclipse or not, but predict its exact magnitude, duration, and phases. It may here be mentioned, that before the laws of the solar and lunar motions were discovered with anything like accuracy, the ancients were able to predict lunar E. with tolerable correctness by means of the lunar cycle (see SOLAR CYCLE) of 18 Julian years and 11 days. Their power of doing so turned on this, that in 223 lunations the moon returns *almost* exactly to the same position in the heavens. If she did return to *exactly* the same position, then, by simply observing the E. which occurred during the 223 lunations, we should know the order in which they would recur in all time coming.

All lunar E. are universal or visible in all parts of the earth which have the moon above their horizon, and are everywhere of the same magnitude, with the same beginning and end; and this universality of lunar E. is the reason why it is popularly thought, contrary to the fact, that they are of more frequent occurrence than solar eclipses. The eastern side of the moon, or left-hand side as we look towards her from the north, is that which first immerges and emerges again. The reason of this is, that the proper motion of the moon is swifter than that of the earth's shadow, so that she overtakes it with her east side foremost, passes through it, and leaves it behind to the west. It will be readily understood, from the explanations above given, that total E. and those of the longest duration happen in the very nodes of the ecliptic. But from the circumstance of the circle of the shadow being much greater than the moon's disk, total E. may happen within a small distance of the nodes, in which cases, however, their duration is the less. The further the moon is from her node at the time, the more partial the eclipse is, till, in the limiting case, she just touches the shadow, and passes on unobscured.

3. *Eclipses of the sun*, so called, are caused, as we have stated, by the interposition of the moon between the earth and sun, through which a greater or less portion of the sun is necessarily hid from view. In one sense, a solar eclipse might more properly be called an eclipse of the earth, caused by the moon's shadow falling upon it.

By a process similar to that used in ascertaining the length of the earth's shadow, it can be shown that the greatest value of the length of the moon's shadow is 59.73 semi-diameters of the earth; at the same time, we know that the least distance of the moon from the earth is about 55.95 semi-diameters. It follows that when a conjunction of the sun and moon happens at a time when the length of the shadow and the distance of the moon from the earth are, or are nearly, equal to the values above stated, the moon's shadow extends to the earth and beyond it. Should the shadow in these circumstances fall upon the earth, there will be a total eclipse of the sun at all places within it or over which it moves (fig. 3). If L be the moon, T the earth, and *ab L* the moon's shadow cast by the sun, there will be a total eclipse of the sun at every point that is completely within the portion *ab* of the earth's surface. Again, the smallest value of the length of the moon's shadow may be shown to be 57.76 semi-diameters of the earth, and the greatest distance of the moon from the earth is 63.82 semi-diameters. Suppose the moon interposed between the earth and sun when these values concur, it is clear that the moon's shadow will fall short of the earth. In this case, the sun cannot be altogether hid from any point of the earth's sur-

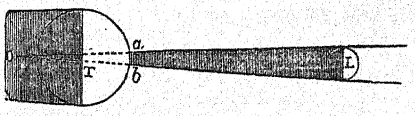

FIG. 3.

face; but this case, or one approximate to it, is that in which there will occur an annular eclipse. In the figure, suppose O to be the apex of the shadow which falls short of the earth, and conceive the cone of the shadow produced earthwards beyond O into a second cone O*cd*; then from every point within the section *cd* of the earth's surface, the moon will be seen projected as a black disk on the middle of the disk of the sun, the portion unobscured forming a ring or annulus of light. While in the two cases just described the eclipse is total or annular at places within *ab* or *cd*, it will be partial at other places; the moon will appear projected against a portion of the sun's disk, making a circular indentation. To ascertain the places at which the eclipse will be partial, we have merely to form the cone of the penumbra of the moon's shadow in the manner explained in treating of lunar E.: at all places on the earth's surface within that cone there will be a partial eclipse. A simple calculation shows what is the observed fact, that the cone of the penumbra is not nearly large enough to embrace the whole of the face of the earth directed to the sun; in other words, solar E. are not universal, like those of the moon, i.e., they are not seen from all places that have the sun above their horizon at the time of the eclipse, which is the reason that though they are of more frequent occurrence than lunar eclipses, the latter are commonly supposed to occur more frequently.

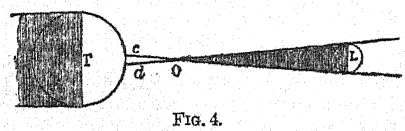

FIG. 4.

If one could take up a position in space from which he could command a view of the whole face of the earth turned to the sun during a lunar eclipse, the phenomena which he would observe would be somewhat as follows. Marking the point of the earth first touched by the penumbra of the moon's shadow, he would observe the obscuration spreading therefrom over a wide and wider area as the penumbra advanced, till at last, supposing him to be viewing the case of a total eclipse, there appeared the umbral cone marking the earth with a dark spot. By and by, the whole penumbral shadow would be on the earth. The black spot would then appear to travel onwards with the motion of the shadow, and in its center, in a course determined by the composition of the proper motion of the shadow or moon, and the motion of rotation of the earth. Part of the globe would be free from the affection, and, in the course of time, the umbral spot would progress over different portions of the earth in succession, till at last it passed off the earth's surface, drawing after it the penumbral shadow. Could the spectator mark on the globe the various places affected by the shadow, with their degrees of shading, he would have a perfect chart of the course of the eclipse. The small belt of the globe traversed by the umbra would mark all places at which the eclipse would be total, while the degrees of shading over places adjoining that belt on both sides would indicate the magnitude of the partial eclipse as seen from them. The breadth of the belt traversed by the umbra, when the sun's distance is greatest and the moon's least, is estimated at about 180 m.; and in the same case the penumbra is estimated to cover a circular space of 4,900 m. in diameter, the eclipse happening exactly at the node. If the eclipse does not happen at the node, it is clear that the axis of the shadow must be inclined to the plane of the ecliptic, that the shadow will be cut obliquely, and therefore that the part of the earth in shade will be oval. It may here be stated that astronomers usually calculate beforehand the motion of the shadow over the earth's surface, and prepare charts to exhibit its motion. Such a chart an observer from a position outside the earth would have it in his power to make from observation.

Of the commoner phenomena attending an eclipse of the sun, as regards the appearance of that luminary, nothing need be said; they are perfectly analogous to those of lunar E., except in the case of the eclipse being annular. There are other appearances, however, attending an eclipse of the sun, especially when it is total, that are very remarkable. The most instantaneous darkening of the orb of day, more particularly when it is unlooked for, is calculated to impress a spectator with vague terror; even when expected, it fills the mind with awe, as a demonstration of the forces and motions of the mechanism of the universe. The sudden darkness, too, is impressive from its *strangeness* as much as from occurring by day; it resembles neither the darkness of night nor the gloom of twilight. The cone of the moon's shadow, though it completely envelops the spectator, does not, as we have explained, inclose the whole atmosphere above his horizon. The mass of uninclosed air accordingly catches the sunlight, and reflects it into the region of the total eclipse, making there a peculiar twilight. Stars and planets appear, and all animals are dismayed by the dismal aspect of nature.—See Mahoud-Bey's report of the total eclipse of July, 1860. Mr. Warren De la Rue, who was one of an expedition of scientific men who went to Spain to witness the same eclipse, gives the following account of the aspects of nature near the time of totality: "When the sun was reduced to a small crescent, the shadows of all objects were depicted with great sharpness and blackness, reminding one of the effects of illumination with the electric light. The sky at this period assumed an indigo tint, and the landscape was tinged with a bronze hue."—*Athenæum*, 1860, vol. ii., page 259. At totality, there was still light enough to enable the observer to draw without the aid of his lamp, while the sky near the sun presented a deep indigo, and thence passed through a sepia tint to red and brilliant orange near the horizon. It must be said, however, that the strange appearance

here recorded is exceptional, and probably not such as could ever occur in our latitude. There is one set of phenomena attending total E. of the sun, which are at once strange and invariable, and the causes of which cannot be said to be yet fully understood. As long as the total eclipse lasts, there appears round the sun and moon a luminous corona, while at its base, and projecting beyond the dark edge of the moon, appear very brilliant prominences, generally of a red color. These prominences were first observed during the total eclipse of 8th July, 1842; but they are found to be constant attendants on E., and methods have been invented of rendering them visible at any time without the interposition of the moon. The spectroscope reveals them to consist mainly of hydrogen gas in an incandescent state, and a comparatively narrow belt of the same color and substance runs round the whole circumference of the sun. The prominences are sometimes seen to shoot up like flames, in wild fantastic shapes, with incredible velocity, and to the height of tens of thousands of miles.

In the eclipse of 1860 the light of the corona was a silvery white, and it extended beyond the moon's limb about eight tenths of her diameter. The corona consisted first of a bright ring of about 2′ wide, and then an exterior and fainter ring of about 3′, beyond which, for a mean distance of about 2′, extended a glory of small rays—the whole corona extending to 7′ beyond the moon's limb. From the corona, at intervals, projected individual rays of remarkable size, and five in number: one of 9′ length; another of 14′, and shaped like the point of a star; a third, sabre-shaped, and extending 28′; a fourth, 28′; and a fifth, 10′. These individual rays are very differently described by different observers of the same eclipse, and are not well accounted for. The diffused light of the corona is believed to be caused by an immense extension of the gases forming the red envelope, only in a cooler and rarer condition.

4. *Prediction of Solar Eclipses.*—The period of 18 Julian years 11 days, referred to in treating of the prediction of lunar E., applies equally to solar E. with lunar; but the ancients, who understood that fact, could find no law of recurrence of solar E. within that period, so as to predict them. The reason of the failure is obvious; for though solar E. recur in a fixed order within the cycle, they are not visible at the same places on their recurrence as when first observed. By modern methods, however, E. of the sun may be predicted, with all their circumstances of time and places of observation, with the most perfect certainty. We shall not, however, attempt to explain what these methods are; suffice it that they resemble those already generally described as applied in the case of lunar E. At the time of a solar eclipse, the sun and moon are in conjunction; they are also in or near the same node; and no eclipse can happen if they are further than 17° from the node, or if the latitude of the moon, viewed from the earth, exceeds the sum of the apparent semi-diameters of the sun and moon. When within these limits, it is a problem of numbers and of spherical trigonometry to ascertain the nature of the eclipse, if any, which will happen.

The number of eclipses of the sun and moon together in a year cannot be less than two, or more than seven; the most usual number is four, and it is rare to have more than six. The explanation of the limitation of the number of E. is connected with the fact, that the sun passes by both nodes but once in a year, except in the case of his passing one early in the year, in which case, owing to the recession of the moon's nodes, he will again pass it a little before the end of the year. From the smallness of the cone of the moon's shadow, total solar E. are extremely unfrequent in any one place, compared with the frequency of their actual occurrence. At Paris there was only one total eclipse of the sun in the 18th c., that of 1724, and there will not be another till near the close of the 19th century. In London, not one total eclipse was witnessed during the 575 years, 1140–1715.

ECLIPSES OF THE SATELLITES. See SATELLITES.

ECLIP'TIC is the name given to the great circle of the heavens round which the sun *seems* to travel from w. to e., in the course of a year. It took its name from the early observed fact, that *eclipses* happen only when both bodies are in or near this path. A little attention about sunset or sunrise shows that the sun is constantly altering his position among the stars visible near him, leaving them every day a little further to the w.; and that this motion is not exactly e. and w., or parallel to the equator, becomes also evident by observing that the sun's height at mid-day is constantly altering. It is further observed that, twice a year, about Mar. 21 and Sept. 23, the sun is exactly on the equator. The two points of the equator on which the sun then stands are the equinoctial points, and are the intersections of the equator and ecliptic. Again, there are two days in the year on which the sun reaches his greatest and his least mid-day elevation: the first is the 21st of June; the second, the 21st of December. On these days, the sun has reached his greatest distance from the equator either way, and the points in his course where he thus seems to pause or halt in his retreat from the equator are called the solstices (*solis stationes*). These four points are distant from one another by a quadrant of the circle, or 90°. Each quadrant is divided into three arcs of 30°, and thus the whole ecliptic is divided into 12 arcs of that length, called signs of the zodiac (q.v.). These arcs or signs have been named after constellations through which the ecliptic passes. As the equinoctial points are not fixed, but recede yearly westwards about 50 seconds, and in a century about 1° 23′, the same constellations and signs that coincided

when the division of the ecliptic took place, no longer coincide. The constellation of the ram, for instance, which originally stood in the first arc or sign, now stands in the second, every constellation having advanced forward 30°, or a whole sign. Modern astronomers therefore pay little attention to these constellations and signs, but count longitudes from the existing spring equinoctial point from 0° to 360°.

Not only do the points change where the ecliptic and equator cross each other, but the angle of their inclination, called the obliquity of the ecliptic, is also variable. It is at present nearly 23½°, and is diminishing at the rate of about 50 seconds in a century. Were it to go on diminishing always, the ecliptic and the equator would at last coincide, and the earth would then have an everlasting spring. The decrease, however, has a limit; the obliquity oscillates between two definite bounds, which it can never pass. It has been calculated that it was at its greatest 2,000 B.C., and was then nearly 23° 53'. Since then, it has been decreasing, and will continue to do so till about the year 6,600 A.D., when it will be at its least, and about 23° 54'. These slight alterations cannot sensibly affect the seasons.

The physical cause of this change of the obliquity is the action of the other planets, especially Jupiter, Mars, and Venus, on the mass of the earth. The fact of the change was known to astronomers in very ancient times; Herodotus mentions an old tradition of the Egyptians, that the ecliptic had formerly been perpendicular to the equator—a notion into which they were most probably led by observing, for a long series of years, that its obliquity was constantly diminishing. There can be little doubt that the Chaldeans arrived at the epoch of 403,000 years before the entry of Alexander into Babylon, to which they proudly referred for their first astronomical observations, by computing the time when the ecliptic was perpendicular to the equator, on the supposition of its obliquity diminishing 1′ in 100 years. Though it was not till after the discovery of the law of gravitation that the change on the obliquity could be explained, yet that it was changing was believed in by many astronomers, although some doubted whether the differences in the values at different times were not due to errors of observation. The earliest known measure of the obliquity of the ecliptic was made by Tcheou Kong, the regent of China. Among the western nations, the earliest measurements were made by Pytheas and by Eratosthenes.

ECLOGUE, usually designates a pastoral poem in which are related the loves and adventures of shepherds and shepherdesses in some ideal scene and period. The name is sometimes applied to Virgil's *Bucolics*. Spenser is perhaps the leading English poet in eclogues—a species of composition now out of date.

ÉCOLE POLYTECHNIQUE is one of the most celebrated military academies in France. In 1793, all the public establishments in Paris were in a convulsed state, owing to the revolution. In 1794, M. Lamblardie, director of the *Ponts et Chaussées*, proposed the establishment of an *Ecole Centrale des Travaux Publics*, to educate young men for military, naval, and civil engineering. Monge and Carnot favoring his plan, it was carried out, and a school established at the palais Bourbon. The first list of professors comprised names which afterwards acquired European celebrity—including those of Lagrange, Prony, Monge, Hachette, Hassenfratz, Fourcroy, Vauquelin, Berthollet, Chaptal, Pelletier, Guyton-Morveau, and Merimée. In 1795, the name was changed to E. P.; many alterations were made in the organization; artillery studies were included in the course; and the pupils were ordered to wear a uniform. When Napoleon went to Egypt, 40 pupils from the E. P. accompanied him, many of whom greatly distinguished themselves. Napoleon made the organization of the school more strictly military in 1804, to identify it more fully with the army. The school was dissolved in 1816, again in 1830, and again in 1832, on account of the impetuous way in which the pupils mixed themselves up with the political disturbances of those years; but as the school suited the military genius of the French nation, it was re-established on each occasion, after the restoration of tranquillity. Candidates can be admitted only by competitive examinations, which take place yearly. A proclamation from the war office, made public before the 1st of April, informs intending competitors of the subjects on which they are to be examined, and the time when the examinations begin. To be eligible as a candidate, the youth must be French, and must be more than sixteen, and less than twenty years of age before the 1st of Jan. following; but soldiers are admissible up to the age of twenty-five, provided they can give proof of two years of service in the regular army. The cost of board alone is 1000 francs (nearly £42) a year. A complete course of instruction lasts for two years; when the pupils who have satisfactorily passed the final examinations have the privilege of choosing, from among the various public services supplied from this school, the particular branch they wish to enter, such as artillery, engineers, the staff, the department of telegraphs, or some of the other government monopolies. The school was reorganized by a decree of the 15th April, 1873.

ECONOMY, a socialist village of Pennsylvania, in the United States, stands on the right bank of the Ohio, about 17 m. below Pittsburg. The settlement was planted in 1825 by immigrants from Germany. The inhabitants own everything in common—3,500 acres of land, upwards of 100 houses, a church, a school, a museum, and manufactories of wool, cotton, and silk. Pop. of township, '70, 1324.

ECONOMY, POLITICAL. See POLITICAL ECONOMY.

ÉCORCHÉ. A figure in which the muscles are represented, stripped of the skin, for purposes of artistic study, is called by the French an É., and from them we have borrowed the term. From a portion of the figure the upper muscles are also removed, so as to exhibit those which lie nearer to the bone. It is not uncommon to represent the É. in action, in the form of the fighting gladiator. The first person who did so was Salvage, a French artist and anatomist. To render the studies of pupils more complete, Salvage had this figure engraved in all the points of view, and more or less denuded of flesh, till at last it was little more than a skeleton, the only muscles represented being those which immediately cover the bones. Figures of this kind can now be procured both in plaster and papier-mâché.

ÉCOUTES (Fr. *écouter*, to listen), in military operations connected with siege-works, are listening-places. They are small galleries, excavated at regular distances, and going out beneath and beyond the glacis, towards the lines and batteries of the besiegers. Their purpose is, to enable the garrison to hear and estimate the works being carried on by the sappers and miners of the enemy.

ECRASEUR, the name of a long steel instrument, invented a few years ago by a distinguished French surgeon, M. Chassaignac, and consisting of a fine chain, which, passed round any structure—as the base of a tumor, for example—gradually constricts it, and finally crushes its way through it by means of a screw or rack for tightening it, which is worked at the end of the handle. The advantage of this instrument over the knife is, that it causes little or no bleeding, the torn vessels spontaneously contracting and closing. It is specially applicable to cases of cancer of the tongue, piles, polypi, and various kinds of tumors. When a solid mass—as, for example, a considerable portion of the side of the tongue—is to be removed, the chain is sometimes pressed through the center, and made to cut two lines successively in the form of a V, in which the diseased structure is included. As the pain which is caused by this instrument is very great, the patient should be placed completely under the action of chloroform before it is applied.

ECRICOK', or **ICRICOK**, a t. of Guinea, the capital of a petty chief, on the Old Calabar river, about 100 m. from its mouth. The river is here about a mile broad. The town consists of mud-houses, erected on platforms.

ECSTASY (Gr. *ekstâsis*, a transposition, a change of situation or condition; applied to the mind in the sense of a state in which it is altered or fundamentally changed in character by some absorbing emotion), a word applied to those states of mind, which, without amounting to insanity (q.v.), in respect of the temporary character of the affection, are marked by mental alienation, and altered or diminished consciousness. A person in ecstasy may be violently moved, or completely passive; convulsed, or rigid, or flaccid in all the limbs; silent, or uttering unmeaning or excited language, or assuming the character of a prophet or inspired person; having, or not having intelligence of what is going on around him. The varieties are infinite, because this morbid state of the mind is nothing more in reality than the fixing of it in a particular attitude, as it were, in connection with an overmastering idea, emotion, or sensation, which causes all other external phenomena to be disregarded. Perhaps the most common form, or, at all events, that which is best known, is religious ecstasy closely allied to monomania and religious delusion of every kind; often simulated, but also occurring as a real disease, as in the case of those "struck" in revival meetings, and in the older histories of the conversions of Cambuslang, the *convulsionnaires* of St. Médard, and the epidemics of religious excitement mentioned under dancing mania (q. v.). It is also common to speak of the ecstasy of terror, and the expression is correct in exaggerated cases, where fear completely paralyzes both the consciousness and the power of motion and expression; so also there is an ecstasy of joy, of love of hate, of meditation; and in some physical states as catalepsy (q.v.), hysteria (q.v.), mesmerism (q.v.), a true ecstasy is one of the phenomena, inasmuch as the proper consciousness of the individual is temporarily abolished, or so much changed in character as to lead almost to the loss of the sense of personal identity. Some of the cases of presumed double consciousness (q.v.) are no doubt of this kind; and generally the same may be said of the state of the mind in many dreams and visions, and also in somnambulism (q.v.). A striking picture of this form of ecstasy is the well-known sleep-walking scene in *Macbeth*, where the lady's mind is so completely preoccupied with the supposed blood stain on her hands, that though her eyes are open, we are told that "their sense is shut," and the mind is also excluded from all the ordinary avenues of communication.

ECTHY'MA is a pustular disease of the skin, in which the pustules often reach the size of a pea, and have a red, slightly elevated, hardish base. In the course of two or three days after the appearance of the pustule, it is replaced by a scab, which adheres firmly to the base, and is somewhat concave. On its removal, a deep red mark, a new scab, an ulcer, or a healed scar remains. The disease may be acute or chronic. The acute form is ushered in by slight constitutional, not amounting to febrile, symptoms, and by a burning or pricking pain at the seat of the eruption, which is usually confined to the neck and shoulders. The disease runs its course in 10 days or a fortnight. In chronic ecthyma, the pustules which follow in crops (often for several months) are

usually scattered over the extremities. This form of eruption indicates a low state of the system. It sometimes follows the acute disease, and not unfrequently is a tertiary symptom of syphilis. Pustules, which in no respect seem to differ from those of ecthyma, are produced by various local irritants. Thus the affection of the hands, popularly known as the *grocer's itch*, is produced by the irritation of brown sugar, perhaps by the *acari* which are so often present in it. Stone-masons are said occasionally to suffer from a similar disease. With regard to *treatment*, the acute form would in most cases doubtless disappear in the course of a fortnight, if left entirely to itself: but as the bowels are usually disordered, an occasional alterative aperient, as a few grains of gray powder with a little rhubarb, may be prescribed, and tepid water applied locally gives great relief. The patient should, moreover, be kept on a moderately good, nutritious diet. In the chronic form of the affection, a meat diet and the use of wine or porter are essential; while tonics, such as a combination of bark and nitric acid, are called for. Tepid baths are often useful, and if there is sleeplessness, an opiate should be taken at or shortly before bedtime.

ECTOZO'A (Gr. *ektos*, without, and *zoos*, living), a term which has been introduced, as in contradistinction to *Entozoa*, to designate those parasitic animals which live upon the external parts of other animals, as lice, tics, etc. Such also are many of the entomostracous crustaceans, parasitic upon fishes. It is a question of much importance, not yet satisfactorily answered, if any of these creatures are the causes of diseased states, in connection with which they are sometimes found in particular abundance, or if their presence in unusual numbers is to be ascribed to disease previously existing.

ECTRO'PION (Gr. *ek*, and *trepo*, I turn out), an everted condition of an eyelid, in consequence of which it does not cover the globe of the eye. It can be remedied by a slight surgical operation.

ECTRO'TIC (from Gr. *ectroma*, abortion), a term applied to methods of treatment which aim at preventing the development of a disease.

ECTYPOG'RAPHY, a method of etching, in which the lines are raised on the plate, in place of being sunk into it. See ETCHING.

ECTYPUM, a cast in relief of an ornamental design, produced from a mold.

ECUADOR', the Spanish term for *equator*, is the name of an independent state of South America, extending from lat. 1° 40′ n. to 5° 50′ s.; and from long. 70° to 81° 20′ west. It measures, therefore, from n. to s. fully 500 m., and from e. to w. nearly 800, presenting an area of about 250,000 sq. miles. It is bounded on the n. by the United States of Colombia, on the e. by Brazil, on the s. by Peru, and on the w. by the Pacific ocean. Toward the e. it is drained by the Amazon, which receives all the rivers that fall down the eastern slopes of the Andes, while the country w. of the Andes is drained chiefly by the Mira, the Esmerelda, and the Guayaquil—the last named being more available for navigation than any other on the same coast of South America. The country is traversed nearly in the line of a meridian, by the two ranges of the Andes, which, alternating between union and separation, sometimes run into what are called knots, and sometimes inclose, at great elevations, plateaus or table-lands. Among these last, ranging from s. to n., the most important are those of Cuença, Hambato, and Quito—their respective heights above the sea being, in feet, 8,640, 8,860, and 9,543. Lofty as these plateaus or table-lands are, they are beset, nay almost shut out from the world, by pinnacles of occasionally more than equal altitude above their own level. Of these the most remarkable are Chimborazo and Cotopaxi (q.v.). In connection with these physical features, the country is subject to volcanoes and earthquakes—the latter frequently occurring, and the former numbering altogether no fewer than sixteen. The climate comprises every possible variety. Hyperborean cold marks the snow-capped mountains; a temperature at once moderate and uniform renders the upland plains so many paradises; while, on both sides of the dividing ridge, intense heat oppresses the lower valleys. The rainfall is different in different localities. In the basin of the Guayaquil, there is regularly a wet season; between it and cape San Lorenzo, almost perpetual drought prevails; and, in the other direction, the upper tributaries of the Amazon are said to be fed by almost perpetual rains.

The population, according to the latest estimates, amounts to about 1,300,000, comprising 600,000 white descendents of Europeans, 650,000 Indians (200,000 Indian savages), 8,000 Africans, and 35,000 Mestizoes. The chief cities are Quito, the capital, and Guayaquil, a great commercial emporium; and the towns of the second class are Riobamba, Puno, Cuença, and Loxa. The government appears to have been constituted on the model of the United States of North America, having a president and vice-president, with a senate and a house of representatives. The foreign trade of E. is carried on chiefly through the port of Guayaquil, the imports of which in 1873 amounted to £950,000. In 1876, the value of the exports was £680,000. In the year 1874, there entered and cleared the port of Guayaquil 154 British and 221 other vessels, of a total tonnage of 331,683 tons. The principal exports are cocoa, the precious metals, timber, bark, hides, etc. The principal articles of import, in order of value, are cottons—more than a fourth of the whole—woolens, wines, spirits, groceries, soap

and candles, hardware, flour, etc. A few cart-roads have recently been made, and a railway was in 1877 being laid down between Puebla and Sibambe.

ECUMENICAL (Gr. *oikoumenikos*), i.e., universal, a term applied to ecclesiastical councils, regarded as representing the whole Christian church, or the church of the whole world (*oikoumenè*), and to the orthodox or Catholic church, regarded as opposed to heretical and merely local sects. The Roman Catholics claim the designation as appropriate to their own church. It is a title of patriarchs, archbishops, and ecclesiastical superintendents of provinces.

EC'ZEMA (from a Greek verb, "to boil out"), an eruption of small vesicles on various parts of the skin, usually crowded together, with little or no inflammation around their bases, and unattended by fever.

EDAM, a t. in North Holland, lies 12 m. n.n.e. from Amsterdam. It has seven entrances, and lies within a green dyke, ornamented by two rows of elm-trees. There is an extensive trade in wood and cheese. The principal industries are ship-building, rope-spinning, sawing wood, tanning leather, etc. There are a Lutheran, a Baptist, a Roman Catholic, and two Reformed churches, one of the latter having beautiful painted windows. In 1864, pop. 5,180; in 1876, 5,361.

ED'DA. There are two works which bear this title—the *Edda Sæmundar hins Froda*, or Edda of Sæmund the wise, and the *Edda Snorra Sturlusonar*. The former and older of these is a collection of the most ancient mythological and heroic Scandinavian songs, the date of whose composition may probably be referred to different periods between the 6th and 8th centuries. These songs, which are supposed to have been collected and arranged by Sæmund Sigfusson, surnamed Frodi, an Icelandic priest, who was born in 1054, and died in 1133, were discovered and first brought before the notice of European scholars in 1643, by Brynjolf Sveinsson, bishop of Skalholt, who applied to them the name of Edda, or "grandmother." This collection was published entire at Stockholm, 1818, by A. A. Afzelius, after the text of prof. Rask; and at Copenhagen, in 1787–1828, with a Latin translation, glossaries, etc. The third volume of this edition, which was completed by prof. Finn Magnusen, consists chiefly of a very learned and copious lexicon mythologicum by the editor. Complete editions of the text of this E. were also published by Munch and Möbius, but all former editions have been superseded by the editions of prof. Bugge of Copenhagen (1867) and of Svendl Grundtvig (1868–74). Hildebrand's text (1876) is founded on theirs. Simrock made a German translation of both Eddas in 1851; and both Ettmüller and the brothers Grimm have translated a part of Sæmund's Edda. The Snorra Edda is a prose composition, and treats of Scandinavian mythology and of the language and modes of composition of the ancient skalds. As the name implies, it is referred to Snorri Sturluson (q.v.), the learned author of the *Heimskringla*, who was born in Iceland in 1178, and died by assassination in 1241, on his return from Norway, where he had lived in the capacity of skald or court-poet. This E. was first published by P. J. Resen in 1665, under the title *Edda Islandorum An. Chr.* MCCXV. *Conscripta per Snorronem Sturlæ*, etc. A complete edition of the prose E., and the most copious of all, was published at Stockholm by prof. Rask in 1818. The trustees of the Arna-Magnæan legacy in Copenhagen have published an elaborate edition, with a Latin translation and notes; and a German edition of both Eddas, with glossary, etc., was published in 1859 by Lüning. A complete English translation of the poetical E., by Ben. Thorpe, was published in 1866. The best English translation of the mythological part of the prose E. is found in a translation of Mallet's *Northern Antiquities*, edited by Blackwall (1847).

ED'DOES. See Cocco

ED'DYSTONE, a group of gneiss rocks, daily submerged by the tide, in the English channel, 9 m. off the Cornish coast, and 14 m. s.s.w. of Plymouth breakwater. The rocks lie in lat 50° 10′ 54″ n., and long. 4° 15′ 53″ e., and have 12 to 150 fathoms water around. The frequent shipwrecks on these rocks led to the erection of a light-house on them by Mr. Winstanley, 1696–1700. It was a wooden polygon, 100 ft. high, with a stone-base; but a storm in 1703 completely washed it away, with the architect. Another light-house was built, 1706–9, also of wood, with a stone base, and 92-ft. high, by Mr. Rudyerd, a silk-mercer. This erection was burned in 1755. The present building, known as the Eddystone light-house, and noted for its strength and the engineering skill it displays, was constructed by Mr. Smeaton in 1757–59, on the model, it is said, of the trunk of the oak-tree. It stands on the sloping side of one of the rocks, and is built of blocks, generally one to two tons weight, of Portland oolite, encased in granite. The granite is dovetailed into the solid rock. The whole forms a circular tower 85 ft. high; the base is 26¾ ft. diameter, and has 13 ft. of solid masonry on it, and the tower contracts to 15 ft. diameter at the top. The light, a fixed one, 72 ft. above the water, is seen at the distance of 13 miles. As the rock on which the tower stands is worn and greatly weakened, the light-house is to be taken down and rebuilt, on another part of the reef. See LIGHT-HOUSE.

EDELINCK, GERARD, a celebrated engraver, b. at Antwerp, 1627; d. in Paris in 1707. He was patronized by Louis XIV. All his works are executed with the graver with admirable clearness and precision.

EDEN, a river rising in the e. of Westmoreland, in the Pennine chain. It runs n.n.w. through the e. of Westmoreland and Cumberland, past Appleby and Carlisle, and ends in a fine estuary at the upper part of the Solway firth, after a course of 65 miles.

EDEN, according to the Hebrew Scriptures, the first residence of man. The description given of it in the book of Genesis is brief, obscure, and in appearance legendary. The allegorical theory will be noticed under Fall (q.v.). In general, however, scholars have preferred to understand the story literally, and to believe that the writer or writers of it meant it to be so understood; but they have not, therefore, been unanimous as to the historical reality, or even the geographical position of Eden. The difference in their modes of apprehending the contents of the Hebrew Scriptures has manifested itself in this as in other *vexatæ questiones* of biblical criticism. Josephus and several of the fathers conceived that Eden was a term denoting the entire region between the Ganges and Nile; Calvin, Huet, Bochart, Wells, etc., have, with slight differences of detail, concluded in favor of Kornah in Babylonia, not far from the Persian gulf; Reland, Calmet, Hales, Faber, J. Pye Smith, in favor of Armenia, near the sources of the Tigris and Euphrates; Le Clerc, in favor of the region near Damascus; while the modern German school of biblical critics, convinced that the Hebrew account is traditional, and, in its present form, of very late composition, and impressed, besides, with the vast antiquity of the far east, have, almost without exception, turned their eyes in that direction, and sought the cradle of the human race in Bactria or Cashmere, or the region lying to the n. of it, a part of which is to this day called Audyana, the "garden." It may also be mentioned that the Mohammedans believe E. to have been in one of the seven heavens—some say the moon—and that the expulsion from paradise consisted in Adam being cast down upon the earth after the fall. It is useless seeking to identify the river system of E. with anything known at present. There is no river on the face of the globe of which the Euphrates and Tigris (Hiddekel) are separate "heads" (whether this means "sources" or "channels"), as they are said to be in the 2d chapter of Genesis, for, as maj. Rennell has shown, although the Euphrates and Tigris *now* unite, for a short space on their way to the Persian gulf, yet, until the time of Alexander the great, they kept entirely distinct courses; and therefore it has been assumed that the "deluge" completely altered the physical character of the region denoted by the term Eden. This was Luther's notion, to which, however, it has been objected, that the narrative in Genesis is so worded as to convey the idea that the countries and rivers spoken of were still existing in the time of the historian. Besides, the science of geology has thrown so much doubt on the universality of a deluge so late as the period assigned to Noah, that it is hazardous to argue on the hypothesis of any extensive physical changes having taken place since the first appearance of man on the planet; at least, if that be dated only some 6,000 years back. It will thus be seen that the question of the locality of E., or of the exact sense in which the Mosaic narrative is to be understood, is involved in inextricable mystery; and it has become a general opinion, that the spiritual significance of this primeval story is what principally concerns Christians—an opinion which derives force from the total silence of the New Testament in reference to the subject.

EDENKOBEN, a t. of Rhenish Batavia, in the circle of Pfalz, 6 m. n.n.w. from Landau. It has a station on the Mannheim and Strasburg railway. It is surrounded by vineyards, which produce much wine, but not of very good quality. Chestnuts are also produced in large quantities in the neighborhood. There is a bathing establishment at E., also several mills and manufactures of fire-arms. It has important grain markets. Near it are the royal villa of Ludwigshohe, and the church and tower of the ruined convent of Heilsbruck. Pop. '75, 4,889.

EDENTA'TA (Lat. toothless), an order of *mammalia* established by Cuvier, and generally received by naturalists. Cuvier remarks, that "although brought together by a purely negative character," the E. have, nevertheless, "some positive mutual relations, particularly in the great claws which encompass the ends of their toes, and which more or less approximate to the nature of hoofs; also in a certain slowness or want of agility, obviously arising from the peculiar organization of their limbs." He included among them, however, the *monotremata*, which, although so few in number, are now generally separated, on account of the very important differences of organization which characterize them. The remaining E. are divided into two tribes—1. *Tardigrada* (slow-paced), containing only the sloths; and, 2. *Effodentia* (diggers), containing armadillos, pangolins, ant-eaters, etc. The ant-eaters and pangolins are the only E. that are absolutely destitute of teeth; but none of the order have any teeth in the forepart of their jaws, and their teeth are comparatively imperfect in structure, being destitute of enamel and distinct roots. The sloths alone subsist on vegetable food, the rest chiefly on insects or on animal substances in a decaying state. The whole number of existing species of E. is not great; but they appear to have been more numerous and of much greater size in a former geological period, as the remains of the *mylodon*, *megatherium*, and *megalonyx* testify.

EDES'SA (modern name, *Urfah*, or *Orfa*), a very ancient city, on the river Daisan, in the n. of Mesopotamia, 78 m. s.w. of Diarbekir, although the Christian or Mohammedan legend, ascribing its foundation to Nimrod, or Khabiba, a female contemporary of Abraham, is unworthy of any credence. With the conquest of Persia by the Greeks,

the history of E. first becomes clearer. Seleucus, in particular, is said to have done much for the aggrandizement of the city. Christianity was introduced into E. at an early period. In the reign of Trajan, the place was made tributary to Rome, and in 216 A.D., became a Roman military colony, under the name of *Colonia Marcia Edessenorum*. During this period its importance in the history of the Christian church continued to increase. More than 300 monasteries are said to have been included within its walls; it was the seat of Ephraim Syrus and his school, and played an important part in the Arian and other controversies. With the extension of the religion of Islam, E. fell into the hands of the Arabian caliphs. Christianity declined, and wars at home and abroad during the caliphate, destroyed likewise its temporal splendor and prosperity, till, in 1040, it fell into the possession of the Seljuk Turks. The Byzantine emperors succeeded in recovering E., but the viceroy contrived to make himself independent. He was, however, hard pressed by the Turks, and this rendered it easy for the crusader Baldwin, the brother of Godfrey of Bouillon, to gain possession of the city (1097 A.D.), and make it the capital of a Latin principality, and the bulwark of the kingdom of Jerusalem. Under the Frankish princes, E. held out valiantly against the Mussulmans, till at length Zengi, ruler of Mosul, succeeded in taking the town and citadel in the year 1144, when all the Christian churches were converted into mosques. An attempt made by the inhabitants to throw off the Turkish yoke, completed the ruin of E.; the Edessenes were defeated by Nur-ed-din; and all who were not massacred, were sold as slaves. After many vicissitudes, in the course of which E. fell successively into the hands of the sultans of Egypt, the Byzantines, the Mongols, Turkomans, and Persians, the city was finally conquered by the Turks, and has ever since formed a portion of the Turkish dominions. It now contains 40,000 inhabitants, of whom 2,000 are Armenian Christians; the rest are Turks, Arabians, Kurds, and Jews. At present, E. has numerous mosques and bazaars; manufactures of cotton goods, goldsmiths' wares, and morocco leather, commerce in British manufactures obtained by way of Aleppo, and a large trade in corn, etc., with Syria. E. is regarded by the easterns as a sacred city, because they believe it to have been the residence of Abraham.

EDES'SA, formerly known as ÆGÆ, the ancient capital of Macedonia, 46 m. w. of Thessalonica, at the head of a defile commanding the approaches from the sea-coast to the interior. It was the original residence of the Macedonian kings, and was the burial-place of the royal family long after it ceased to be the seat of government. In Edessa Philip II. was murdered by Pausanias, 336 B.C. The greater Alexander was buried at Memphis, but Edessa remained the royal burial-place, and when Pyrrhus occupied the place, the royal tombs were plundered by his Gallic mercenaries. The modern city of Vodena is built on the site of Edessa, and some remains of the ancient buildings are preserved.

ED'FOU (Coptic, *Atbô;* Egypt. *Hut;* anc. *Apollinopolis Magna*), a t. of upper Egypt, is situated on the left bank of the Nile, in lat. 25° n., and long. 32° 45' east. It contains the remains of two temples, which are considered the finest remains of antiquity in Egypt. The larger of these temples was commenced by Ptolemæus Philometor 181 B.C., but does not appear to have been completed till the reign of Claudius. There appears, however, to have been a temple there in the reign of Thothmes III. Its length is about 400 ft., its breadth 150. Its entrance is by a gateway 50 ft. high, between two immense truncated pylones, 37 ft. wide at the base, and 114 ft. high. These are adorned with masterly sculptures. Passing through this entrance, the court is reached; it is 161 ft. long, and 140 ft. wide, inclosed by a splendid colonnade of 32 pillars, each differing in design, and surrounded by walls, between which and the pillars there is a stone roof, forming a covered portico. The interior of this court is to a great extent filled up with rubbish, and occupied by wretched dwellings, many of which also are built upon the roof of the temple. Within the temple, there are several chambers, one of which, about 33 ft. by 17, contained the image of the deity; in it was also a zodiac. The effect of the whole is grand and imposing, impressing the mind with the harmony and perfect beauty of the design. An inscription on the outer wall recorded the endowment of the temple by Ptolemy Alexander I., and Darius, Nectanebo, and Nectanebes II. The smaller temple, erected by Physcon and Lathyrus, consists only of two chambers. Its walls are covered with hieroglyphics representing the life of *Horus*, the son of *Kneph* and *Athor*, who were worshiped in the great temple. These temples have been lately entirely cleared by Mariette. E. has at present a population of about 2,000. Its manufactures are blue cotton cloths, and earthenware similar to the ancient Egyptian pottery.—Wilkinson, *Modern Egypt*, p. 274; Brugsch, *Reiseberichte*, p. 225; Lepsius, *Egypt and Ethiopia*, p. 117.

EDGAR, a co. in e. Illinois, on the Indiana border, drained by affluents of the Wabash, and intersected by the Indianapolis and St. Louis railroad; 580 sq.m.; pop. '70, 21,450. It has a level surface of prairie and timber land, and fertile soil. The chief productions are corn, wheat, oats, butter, and wool. Co. seat, Paris.

EDGARTOWN, a village and port of entry in Dukes co., Mass., 75 m. s.s.e. of Boston; pop. '70, 1516. The port is on the e. side of the island, and has a well-sheltered harbor. There is daily communication with the mainland at Falmouth. Near Edgartown is a

grove which has become famous for Methodist camp-meetings, at which sometimes as many as 20,000 people attend. Navigation and fishing are the principal occupations.

EDGECOMBE, a co. in n.e. North Carolina, on Tar river, intersected by a branch of the Wilmington and Weldon railroad; 600 sq.m.; pop. '70, 22,970—15,112 colored. The surface is generally level, and the soil light and sandy. The chief productions are corn, cotton, and turpentine. Co. seat, Tarboro.

EDGECUMBE.—1. A bay in the e. coast of Australia, lies within the province of Queensland, near lat. 20° s., and long. 148° east. It is sheltered on every side but the north, its east barrier terminating in cape Gloucester.—2. A mountain in what was formerly Russian America, marks the n.w. point at the mouth of Norfolk sound, which connects the settlement of New Archangel on the island of Sitka with the open ocean. It rises from the water's edge as an almost perfect cone, which, during nearly the whole year, is capped with snow. It has been an active volcano within the recollection of some of the Russian colonists; and, even at the present day, the neighborhood presents indications of subterranean energy, such as tremblings of the earth, hot springs, and eruptions of smoke and ashes. See AMERICA.

EDGEHILL, BATTLE OF. The first great battle of the civil war was fought on Sunday, 23d Oct., 1642, between the royalist forces under Charles and the parliamentarians under the earl of Essex. It was the intention of Charles, who had been lying at Shrewsbury, to march upon London by Wolverhampton, Birmingham, and Kenilworth; and Essex, who had thrown himself into Worcester, on being informed of the king's plans, marched forward to intercept him, and entered the village of Keinton, in Warwickshire, on the evening of the 22d. On the following morning, the royalist army was discovered a little in advance, and drawn up in order of battle on the elevation of Edgehill. The king's forces had the advantage in numbers and in cavalry, as well as in position; Essex, however, had the more formidable train of artillery. Charles had commanded that hostilities should be delayed until the enemy should open fire; accordingly no movement took place till about two o'clock, when Essex commenced the fight by firing upon the royalists, who immediately replied with their cannon. The royalists then began to descend the hill, and prince Rupert, who led the right wing, charged with his cavalry the left wing of the parliamentarians, broke it, and pursued it madly to Keinton, where his men, regardless of the main army, busied themselves in plunder. This was the fatal movement of the day. The right wing of the parliamentarians had charged and recharged with the greatest success, until, after some stubborn fighting around the royal standard, the royalists broke, and retreated toward the hill. That night 4,000 men lay slain at the foot of Edgehill, and of these the greater number were royalists.

EDGEFIELD, a co. in w. South Carolina, on the Savannah river, by which it is separated from Georgia, traversed by the South Carolina, the Charlotte, Columbia and Augusta, and the Greenville and Augusta railroads; 1150 sq.m.; pop. '70, 42,486—25,417 colored. The surface is hilly, and the soil moderately fertile, producing corn, cotton, etc. There is abundant water-power, and a number of mills and factories. Co. seat, Edgefield Court House.

EDGEWORTH, MARIA, the daughter of Richard Lovell Edgeworth, of Edgeworthstown, co. of Longford, Ireland, was born at Hare Hatch, near Reading, Berkshire, in the year 1767. In 1782, her father returned to Ireland, accompanied by his family, to whose education he earnestly devoted himself. Maria's talents quickly developed themselves. Her first literary effort was written in conjunction with her father, and was entitled *Essays on Practical Education* (1798). In 1801 appeared the *Essay on Irish Bulls*, which was also in part the work of Mr. Edgeworth. But it was in the sphere of fiction that Miss E. won her greatest triumphs. In 1801, she published *Castle Rackrent*, the first of a pretty extensive series of novels characterized in general by a quiet, agreeable humor, excellent sense, and lively delineation of character and manners. It has been objected by critics, however, that some of them are too manifestly didactic to please as fiction should please. In 1803 appeared *Belinda;* in 1804, *Popular Tales;* in 1806, *Leonora;* in 1809, *Tales of Fashionable Life;* and in 1812, a second series of the same. The last of the series was "Helen," which was published in 1834. Among the most successful of her *Tales of Fashionable Life* were "Ennui" and "The Absentee." Miss E.'s stories for children—the last of which, *Orlandino*, appeared in *Chambers's Library for Young People*—are deserving of high praise. This gifted and universally respected authoress died at Edgeworthstown, 21st May, 1849.

EDGEWORTH, RICHARD LOVELL, 1744–1817; b. Bath, England; the father of the celebrated authoress Maria Edgeworth, and associated with her in literary labors. He was an intimate friend of Dr. Erasmus Darwin. Among his writings are *Professional Education; Practical Education; Essay on Irish Bulls;* and autobiographical memoirs.

EDGINGS are indispensable to neatness in gardening, except where parterres are cut out of a lawn, but more especially to separate gravel-walks from cultivated ground. They are sometimes made of stone or of deal; sometimes of ornamental wicker-work, and now not unfrequently of wire-work; but for many purposes, the best edgings are formed of low-growing evergreen plants, and none are so common in Britain as those

of dwarf-box, which, when carefully trimmed, are very pleasing to the eye, and do not require renewal for a number of years. Thrift or sea-pink is another not uncommon edging, is beautiful at all times, and particularly so when in flower, but requires frequent renewal. The double daisy, often planted as an edging, also requires frequent renewal. Turf-edgings are sometimes employed for wide flower-borders.

ED'IBLE BIRDS' NESTS, or EDIBLE SWALLOWS' NESTS. See NESTS, EDIBLE.

EDICT (Lat. *edictum*). The power of making edicts (*jus edicendi*) belonged generally to the higher magistrates at Rome; but it was by the curule ædiles, and more extensively still by two prætors—the *prætor urbanus*, and the *prætor peregrinus*—that it was prominently exercised. In a province, the jurisdiction of the prætor passed to the *præses*. As this power was co-extensive with the possession of what were called the honors (*honores*), it was frequently spoken of as the *jus honorarium:* and from its being exercised chiefly by the prætors, it was also known as the *jus prætorium*. The edicts of the prætors are mentioned by Gaius among the sources of the Roman law; but, strictly speaking, they are to be considered as rules promulgated by the magistrates on entering on office, rather than as expressions of the will of the Roman people, either direct or indirect. The E. of one prætor was not binding on his successor, but very often edicts were adopted and confirmed, and this came gradually to constitute a very important body of law. They were frequently known by the names of their first promulgators, though they were often named with reference to the formula and the *actio* which they established. The power of promulgating edicts is supposed to have flowed down from the kings to the consuls, and through them to the prætors, and thus to have formed part of what we should call the royal prerogative. Even in Cicero's time, the study of the E. had become a regular branch of the study of the law. In 67 B.C., the Lex Cornelia provided against the abuse of passing edicts for the decision of particular cases by requiring the prætors to decide in conformity with the edicts which they promulgated with reference to their whole tenure of office, which were known as perpetual edicts. Servius Sulpicius, the friend of Cicero, addressed to Brutus a work on the subject; and Ofilius made what was probably a compilation of the various edicta, resembling the subsequent one by Julian. The object of the E., according to the Roman jurists, was to aid, supplement, and correct the civil law, and to render it more conducive to the public service, and they speak of it as "the living voice of the civil law." It was, in short, an indirect form of legislation, which public opinion had sanctioned for the public convenience; and there can be no doubt that it contributed what was ultimately the most valuable part of the Roman law. There were many commentators on the edicts under the emperors, amongst whom Labeo is mentioned and cited by Ulpian (*Dig.* 4, tit. 3, s. 9). Julian is supposed to have collected and arranged the edicts, and given to them a systematic form. Gaius, Ulpian, and Paulus composed treatises on the edicts of the curule ædiles; and it is chiefly from the writings of these and the other jurists excerpted in the *Digest*, that we know anything of the character of the E., the portions of it which have been preserved being mere fragments. They have been collected by Wieling in his *Fragmenta Edicti Perpetui* (Frank. 1733).

EDICT OF NANTES. See NANTES.

EDIC'TAL CITATION, or INTIMATION. By the former practice of Scotland, where the party to be cited before a civil court was out of Scotland, the citation required to be given by a messenger-at-arms making proclamation at the market-cross of Edinburgh, and at the pier and shore of Leith. The idea, of course, was, that the fact was thus more likely to reach the absent party than if it had been intimated or published in any other manner.—Erskine, b. i. tit. 2, s. 18. But the practice in this matter was altered by the so-called judicature act (6 Geo. IV. c. 120), and the subsequent statute, 13 and 14 Vict. c. 36, s. 22, which enacted that services against persons forth of Scotland should be done by delivery of copies at the record office of the keeper of the records of the court of session. Abstracts of the copies delivered to the keeper are ordered to be recorded by him, and to be printed periodically at the end of each successive 14 days, and the record is to be at all times open for inspection. In criminal cases, the old forms still remain unaltered.

EDINBURGH, the capital of Scotland, and chief town in the co. of Mid-Lothian, occupies a picturesque situation on a cluster of eminences, at a distance of about a mile and a half from the firth of Forth (q.v.), which is here about 6 m. in breadth. The outskirts extend almost to the shore, and a connection has thus been formed on the n. with Leith, the ancient port; Newhaven, a fishing village; and Granton, a modern and rising port. The admirable position of E. has induced the comparison with Athens, from which, as well as its literary fame, it takes the title "Modern Athens." The Gaelic name of the city is "Dunedin."

The castle, which crowns the highest point in the city, was undoubtedly built first, a town gradually forming on the top and sides of the ridge, which slopes downwards to the east. For some centuries the city was confined entirely to this ridge or hill, and was flanked on the n. by a lake or marsh called the Nor' Loch. The remaining means of defense was a wall built by the citizens about the middle of the 15th c., a few relics of which, of different eras, still exist. E. was therefore a fortified town, protected by

the castle at its western extremity. When David I. was induced by his piety and munificence to found the abbey of Holyrood in the low ground eastward of the city, he at the same time empowered the canons of this religious house to found a burgh in a westerly direction towards the city of E., and thus was built the Canongate, afterwards united to the city. The beautiful abbey itself has been a ruin since the fall of its roof in 1768. In connection with the abbey sprung up the palace, which became a favorite abode of the Scottish sovereigns. Not, however, till about the era of the murder of James I. at Perth in 1437, did E. become the recognized capital of the kingdom. Neither Perth nor Scone, Stirling nor Dunfermline, being able to offer to royalty security against the designs of the nobles, E. with its castle was thenceforth selected as the only place of safety for the royal household, the parliament, the mint, and the various important government offices. By this means rising in importance, E. became densely peopled, and the houses were built to an unusual height, that the inhabitants might keep within the walls for the sake of protection. The town then consisted of the original main way called the High street, reaching to the Canongate, and a parallel way, narrow and confined, on the s., called the Cowgate, connected with each other by upwards of 100 narrow cross alleys or closes, between dense clusters of houses. Most of these houses consisted of a succession of floors or flats, each being a separate dwelling, and of such floors there were seldom fewer than 6, and sometimes 10 or 12, towering to an immense height, and rendered still more imposing from being built on an eminence.

The citizens remained content with these confined limits till about the middle of the 18th century. Between 1763 and 1769, the North bridge was erected, connecting the old city with the fields on the n., on which the *New Town* was beginning to be built. Shortly afterwards, in 1788, the line of this bridge was extended southwards by 22 arches (the South bridge), only one of which is seen where the structure spans the Cowgate, and thus a level way was opened to the southern suburbs, which have since rivaled the new town in rapid growth. George the Fourth's bridge was erected over the same valley a short distance to the westward, a considerable time afterwards. The Nor' Loch was drained and partially bridged over by the Mound formed from the earth dug from the foundations of the new town, and its situation is occupied by fine public and private gardens which now lie in the center of modern E., and separate Princes street, the southmost and most picturesque street of the new town, from the old town. Two other bridges give access to E.—the Regent's bridge, Waterloo place, which arches the valley between Princes street and the Calton hill to the e.; and at the w. end, the fine Dean bridge over the water of Leith, which is 106 ft. high. Quite recently, a very handsome and commodious bridge has been completed by the railway company, near to and parallel with the North bridge. The new town being built with much regularity in straight streets, and in squares and crescents with numerous gardens, contrasts with the crowded, though picturesque masses of the old town. The dilapidated and dangerous state of part of the old town, and the necessities of sanitary ameliorations in the over-crowded buildings, have occasioned great changes of recent years, and several new streets have been opened up through the most crowded and ruinous localities.

Altogether built of durable sandstone from quarries in the neighborhood, the general aspect of the houses is that of great solidity. Among the most interesting features of the town are the castle, in which are shown the ancient regalia of Scotland; the parliament house, used by the Scottish parliament before the union; St. Giles' cathedral, lately restored, with a magnificent crown on the central tower; the abbey and palace of Holyrood (q.v.); the bank of Scotland, recently rebuilt; the Scott monument, designed by a native self-taught artist; Heriot's (q.v.) and Donaldson's (q.v.) hospitals; the general register house, where all heritable titles and state documents are recorded and preserved; the post-office; the royal institution, where the royal society, and the society of antiquaries of Scotland, meet; national gallery; the university and museum of science and art; the Episcopal churches (St. John's and St. Paul's); and the banks, clubs, insurance offices, and hotels of Princes street and George street. The unfinished national monument on the Calton hill is striking from its position. An Anglican cathedral and a new infirmary have been built. The country round E. is finely varied. From Arthur's seat and Salisbury crags, on the s.e., the eye wanders to the Braid hills on the s., and the richly wooded Corstorphine hill on the w., all within a mile or two of the town; while further off begin the Pentland hills, 4 m. to the s.e.; and to the n. the firth of Forth, and the Fife coast and hills, form a magnificent background. The climate is bracing and healthy, although the situation is exposed, not so much rain falling as on the w. coast, and high winds are very prevalent.

E. is not an important manufacturing town, though it derives considerable commercial importance from its various banks and insurance offices, round which revolves no mean portion of the monetary capital of Scotland. The principal industries are brewing (two thirds of all the ale or beer brewed in Scotland being made in or near E.), printing and publishing with the kindred arts (see BOOK-TRADE), distilling, ironfounding, tanning, and coachbuilding, manufacture of articles in India-rubber, of house-furniture, and of jewelry, and the rearing of young trees in nurseries in and around the town, for which the climate is favorable.

E. is the place of residence of considerable numbers of the Scottish landed gentry, and its society is regarded as unusually polished from the predominance of the professional

and literary elements in its composition. This arises partly from its being a university town, and partly from the presence of the supreme law courts of Scotland (see COLLEGE OF JUSTICE), all the important legal business being attracted thither on that account; the Edinburgh lawyers have charge of most of the landed estates throughout the northern part of the kingdom, so that there is an unusual number of advocates (barristers), writers to the signet, and solicitors (attorneys and conveyancers), and accountants. Its medical practitioners—surgeons and physicians—have a high reputation. E. is much resorted to for the sake of education, for its university (q.v.) and medical schools, its high school, and its various other educational institutes. The Free church and the United Presbyterian church have each a well-equipped divinity hall in E. The opening in 1869 of the merchant company's schools, which (by utilizing certain surplus hospital funds) provide high-class instruction at moderate charges for about 5,000 male and female pupils, has added to the influx of residents desirous of availing themselves of this boon. For the poorer classes, part of the enormous funds of George Heriot's charity have been diverted for cheaper schools throughout the town. Fettes college is a foundation school on the model of Rugby and Eton, and is a handsome edifice.

E. is largely resorted to by visitors to the Highlands of Scotland, and has an unusual number of hotels. There are two theaters, and abundance of amusement, including a large open-air gymnasium. In the southern environs are fine open links or downs, where the game of golf (q.v.) has been played from time immemorial. Excellent street cabs are to be found, and tramways are laid to the suburbs.

E. is the seat of various Scottish boards (poor-law supervision, lunacy, fisheries, school, northern light-houses, etc.); in it the Established and Free churches hold their annual assemblies and courts, as do the United Presbyterians.

E. is a royal burgh, governed by a town-council composed of 41 members. The town-council elects from its own body a lord provost and six bailies, who constitute the civic magistracy. E. is represented by two members in parliament.

In 1821, the pop. was 112,335; in 1861, it was 167,851; and in 1871, 196,979. Number of inhabited houses, 10,529; parliamentary and municipal constituency (1878–79), 28,342.

EDINBURGH, ALFRED ERNEST ALBERT, Duke of, commonly known as prince Alfred; third child and second son of Victoria, queen of Great Britain; b. Aug. 6, 1844. He is also a duke of Saxony, and prince of Saxe-Coburg-Gotha. He was educated by special tutors, and at the age of 14 went into the royal navy, serving chiefly in foreign stations. The crown of Greece was offered to him in 1862, but he declined it. In 1866, he took his place in the house of lords; in 1867, he commanded the frigate *Galatea* on a voyage to Australia and India. He attended a picnic in New South Wales, where an Irishman fired at and slightly wounded him. The duke married at St. Petersburg, Jan. 21, 1874, Marie Alexandrowna, grand duchess of Russia. They have four children, a son and three daughters.

EDINBURGH, THE UNIVERSITY OF, took its rise from a bequest in 1558 by Robert Reid, bishop of Orkney, of 8,000 merks; but the sum was retained for a considerable time by the abbot of Kinloss. The magistrates of the city, on the faith of receiving the bequest, purchased in 1563 a portion of the ground on which the present university stands. Queen Mary was anxious that the proposed institution should succeed, and bestowed upon it grants of confiscated church property. The university was formally founded by king James VI. in 1582 by royal charter, in virtue of which the corporation, up till 1858, remained its patrons or governors. In 1583, the work of instruction began under Robert Rollock, the first regent. Originally, the university consisted of but one class and one regent or teacher. The regent had charge of the students from their enrollment to their laureation at the close of the fourth session of study. As the university prospered, additions were made to the staff of regents, and separate chairs for the several branches were founded. In the beginning of the 17th c., the senatus academicus consisted of a principal and four regents. The first theological chair was instituted in 1642, and the first professor of medicine was appointed in 1685. After 1688, the university of E., along with its sister universities, was subjected to a parliamentary visitation. The commission was issued in 1690, and till the close of the century the university was under its control. Under this supervision, a separate chair of Greek was established; and after 1708, the present arrangement of the faculty of arts came into existence. About this period, the faculty of law was created. During the 18th c., the professoriate rapidly increased; and in 1760, the senatus academicus contained 18 professors besides the principal. Twenty chairs have since been added. In 1858, an act of parliament was passed, by which the constitution of the university was materially changed. The government was taken out of the hands of the lord provost, magistrates, and town-council of the city, and placed in the senatus academicus and a university court; and the patronage of the chairs—from 1582 in possession of the corporation—was transferred to seven curators, three of whom are nominated by the university court, and four by the town-council. A general council was also established, consisting of graduates of the university, and all persons who, up till Aug., 1861, could satisfy the university commissioners that they had given attendance on four complete sessions of the university, two of these sessions being in the course of study

in the faculty of arts. The members of this body, together with the professors and university court, have the right of voting in the election of a member of parliament for the universities of Edinburgh and St. Andrews.

Matriculation, Faculties, Degrees.—Students entering any class in the university, are required to inscribe their names in the general matriculation album of the university, which is the legal record of attendance; and the matriculation ticket serves as a passport to the privileges of the university library. The university consists of the faculties of arts, medicine, theology, and law. The faculty of arts comprises the chairs of humanity, Greek, mathematics, logic and metaphysics, moral philosophy, natural philosophy, rhetoric and belles lettres, universal history, practical astronomy, agriculture, music, Sanscrit, engineering, geology, political economy, fine arts, and education. Attendance on the first seven of these is incumbent on every one proceeding to the degree of M.A. The medical faculty comprises the chairs of institutes of medicine, materia medica, medical jurisprudence, chemistry, surgery, practice of physic, anatomy, pathology, midwifery, clinical medicine, clinical surgery, botany, natural history. The faculty of theology comprises the chairs of divinity, ecclesiastical history, Biblical criticism and antiquities, Hebrew. The faculty of law comprises the chairs of civil law, public law, law of Scotland, conveyancing. The degrees granted by the university are master of arts, bachelor of medicine, master of surgery, doctor of medicine, bachelor of science, doctor of science, bachelor of divinity, doctor of divinity, bachelor of laws, doctor of laws.

Libraries, Museum, Societies.—The university library originated in a bequest, in 1580, by Mr. Clement Little. The bequest amounted to about 300 volumes. It enjoyed the right of receiving every book entered in Stationers' hall, but a composition of £575 per annum in lieu of the privilege was subsequently accepted. The university library contains about 138,000 printed volumes, and 700 volumes of MSS. The university also contains subsidiary libraries, such as the theological library, the humanity class library, etc. The natural history museum was established in 1812, and received a government grant of £200 per annum. It was in 1854 transferred to the new museum of science and art, where it forms a natural history department, of which the professor of natural history is the regius keeper. The anatomical museum was founded by the town-council and the senatus academicus in 1826. The botanical museum is stationed in the botanic garden, which is in connection with the university, and several valuable museums exist as appendages to classes. There are several societies in connection with the university, which meet in its buildings during the winter session.

Bursaries.—There are considerably upwards of 100 bursaries and prizes connected with the university of E., and the total yearly amount of these may be estimated at more than £2,500. These bursaries are appropriated to the different faculties, and are in the patronage of the senatus, the town-council, and of private individuals. Their yearly values range from £5 to £90, and they are generally held for a period of four years.

Scholarships and Fellowships.—There have been recently instituted about 30 scholarships, of the value of from £30 to £120, and 8 fellowships, from £100 to £160 per annum.

Students.—The number of students has of late been steadily increasing, and in 1877-78 reached the large number of 2,500. The present buildings are now found insufficient for so great an attendance, and it is contemplated removing the medical department to new buildings, which are to be erected in the immediate neighborhood of the new royal infirmary.

EDINBURGH REVIEW, the first of the great critical periodicals which form a distinguishing feature of the literature of the 19th century. It was started in Oct., 1802, by a knot of young men living in the northern metropolis, the principal of whom were Francis Jeffrey (q.v.), Sidney Smith (q.v.), F. Horner, and Henry Brougham (q.v.). So much was secrecy felt or believed to be necessary to the success of the undertaking, that, according to the account which lord Jeffrey gave to Mr. Robert Chambers in 1846, "the dark divans" of the reviewers were held for some time "in a dingy room of Willison's printing-office in Craig's Close," to which each repaired alone, and "by back approaches or different lanes." Of the first number, 750 copies were printed: the demand exceeded this limited supply; 750 more were thrown off, and successive editions followed. In 1808, the circulation had risen to about 9,000, and it is believed to have reached its maximum—from which it has declined—in 1813, when 12,000 or 13,000 copies were printed. The pay of contributors was at first ten guineas a sheet, but shortly after "the *minimum*," says Jeffrey, "was raised to sixteen guineas, at which it remained during my reign. Two thirds of the articles were, however, paid much higher, averaging, I should think, from twenty to twenty-five guineas a sheet on the whole number." The original publisher was the well-known Constable. The political views advocated in the early pages of the *Edinburgh Review* were *whig*, and to these it has consistently adhered to the present day. Its influence in developing and strengthening the political convictions of the whig party cannot be overestimated; but its power was even more visible, certainly more immediately palpable, in literature. Amid the feeble and effete periodicals of the day, it burst like a bombshell. The keenness of criticism,

the sharpness of wit, the brilliancy of style, the vigor of mind and comprehensiveness of knowledge exhibited by the writers, excited amazement and fear in the world of letters; and although, in the case of Wordsworth, Southey, and other writers of a certain school, unfairness of a flagrant kind was undoubtedly exhibited and persevered in, yet impartial justice was, on the whole, administered, and the rising generation of authors strained their utmost to escape the lash. Since the period of Jeffrey, the most brilliant contributor to the *Edinburgh Review* was the late lord Macaulay.

EDINBURGHSHIRE, or MID-LO'THIAN, the metropolitan co. of Scotland, lying on the s. side of the firth of Forth. Its greatest length from e. to w. is 36 m., and its breadth 18 m., with an area of 367 sq. miles. From the s. border, the Pentland hills (mean height 1000 ft., and highest point 1839 ft.) and the Moorfoot hills (mean height 800 ft., and highest point 2,136 ft.) run n.e. through the county. In the n. are fertile plains, varied by gentle slopes, ridges, and hills of trap. The coast, 13 m. long, is partly sandy, and is studded with towns, villages, and piers. The chief rivers are not above 20 m. long, and are the Esk, Water of Leith, Almond, and Gala Water. Four great roads and five great railways traverse the county. E. chiefly consists of carboniferous strata, with protrusions of trap. Some lower Silurian rocks occur in the s.e. Coal and iron are chiefly worked in the broad valley of the Esk. Here the bed of coal extends 15 by 8 m., and contains 33 seams ¾ of a foot to 6 ft. thick. The fine sandstone quarries of Craigleith contain large fossil trees, and the limestone of Burdiehouse is famed for fossil fishes. Cold and dry e. winds prevail in spring. Clay soil predominates. The county is chiefly agricultural, with large farms. The harvest is a week earlier on the coast than at the height of 200 ft., and a fortnight earlier than at the height of 600 feet. Near the metropolis are extensive nurseries, vegetable and fruit gardens, and dairy pastures. In 1878, of the total acreage of 234,926 acres, 133,757 acres were in crop. Pop. '71, 328,379. Although not important as a manufacturing county, there are considerable manufactures of various goods in Edinburgh, Leith, and Musselburgh; and there are large paper-mills along the course of the North Esk. Much paraffin oil is made from the rich bituminous shale found within the county. E. returns one member to parliament for the county. It contains 46 parishes. The chief towns are Edinburgh, the metropolis of Scotland; Leith, its seaport; Dalkeith, Musselburgh, and Portobello. In E. have been found cairns, stone circles, Roman coins and utensils, and traces of Roman camps and burying-places. E. was included in the Roman province Valentia, and Cramond is supposed to have been a chief Roman port. It afterwards formed part of the kingdom of Northumbria, 446–1020. The county contains many feudal and ecclesiastical remains, as Borthwick castle, Craigmillar castle, and Roslin chapel.

EDISON, THOMAS ALVA, b. Ohio, 1847, of a mother of Scotch and a father of Dutch descent. The boy had scarcely eight weeks of common school education, but he had a passion for reading, and his education was greatly advanced by the assiduous care of his mother, who, however, died when he was but 15 years old. Before he was 12 he had read Hume and Gibbon, and all that he could get of the *Penny Cyclopædia*. He had a liking for chemistry, and such a thirst for all kinds of knowledge, that he firmly resolved to read every important book in the Detroit public library. With this design he went through Newton's *Principia*, Ure's *Dictionary of Science*, and by way of dessert, Burton's *Anatomy of Melancholy*. Becoming a newsboy on the trains of the Grand Trunk railroad, his employment introduced him to a more varied range of books. The infection of chemistry clung to him, and was developed by his establishing a laboratory in an empty car. But his chemicals exploded, set the car on fire, and put the train in great danger. The boy and his broken apparatus were promptly thrown out of the car by the indignant conductor. The next venture of the young enthusiast was in getting a small lot of type, and issuing on the train a small sheet called *The Grand Trunk Herald*. Becoming acquainted with telegraph operators, he determined to learn the art himself. A kind-hearted station-master consented to give him lessons, and for several months Edison returned to that station after a long day's work, and took his regular lessons at night. He became an expert operator, and was employed at Port Huron, Mich., Stratford, Canada, and Adrian, Mich, where he also prepared a small workshop and began to repair telegraph instruments and manufacture other novel machinery. From this place he went to Indianapolis, where he invented his automatic repeater, an instrument by which messages are transferred from one wire to another without the aid of an operator. He wandered to Cincinnati, Louisville, Memphis, and New Orleans, returned to Cincinnati, and at the age of 20 began to be known as a successful inventor. But he was called to Boston on telegraph business, having become famous as one of the most expert of operators, and there he set up a shop for his experiments. Testing, in 1870, between Rochester, N. Y., and Boston, his new invention of duplex telegraphing, he was not successful; but he was employed by the gold indicator company in New York, of which he became superintendent. While in this position he brought out some new inventions, and introduced improved apparatus. At the same time he set up a factory in Newark, N. J., for making his novel apparatus and machines. Here he employed 300 persons; but the superintendence took so much of his time that he gave it up, and, in 1876, set up a small experimenting establishment at Menlo Park, on the Pennsylvania railroad, 24 m. from New York. This establishment has grown to be

almost a village in itself, and since the commencement of 1879, has been the Mecca of all men interested in the perfection of artificial lighting by electricity. At the time of this writing (Aug., 1880), he has made no public demonstration, but one is promised ere long, and then he confidently expects to give the world a safe, cheap, and reliable electric carbon light that will take the place of nearly all the illuminating materials now in use. The number of inventions, great and small, already patented by Edison, is said to be nearly 200. The most important are the carbon telephone, the phonograph, the micro-tasimeter, the aërophone, the megaphone, the phonometer, the electric pen, and especially the quadruplex system of telegraphing, by means of which four messages at the same time may be sent in opposite directions over a single wire, and perfectly delivered.

EDISTO, a river of South Carolina, flows through the s.w. part of the state, being formed near Branchville of the North Edisto and the South Edisto, and entering the Atlantic by two arms respectively named from the two confluents. E. also designates the island which separates those two arms. The stream is navigable for 100 m. upwards, and its mouth is about 20 m. to the s.w. of Charleston.

EDISTO ISLAND, one of the "sea islands" so famous for long-staple cotton, on the South Carolina coast, between North and South Edisto inlets; pop. '70, 2,762—2,634 colored.

EDMONDS, John Worth, b. N. Y.; 1799–1874; a graduate of Union college, admitted to the bar in 1819, and practiced law in his native city (Hudson). In 1831, he was a member of the state assembly, and of the senate (then the court of errors) from 1832 to 1835. In 1837, he removed to New York city; in 1845, he was appointed one of the circuit judges; in 1847, judge of the supreme court, and in 1852, one of the judges of appeals. About 1851, he became convinced of the truth of spiritual manifestations, and in 1853 publicly declared his faith—preparing and publishing a work entitled *Spiritualism.* He became a leading champion of the doctrines, and his well-known ability as a jurist was of great advantage to the unpopular innovation. He was himself a "medium," and was convinced that he was frequently in communication with the spirits of the departed. No doubt this attachment to spiritualism had great influence in bringing about his retirement from the bench; but no one supposed that his faculties or his honesty as a jurist were in the least influenced by his peculiar belief; nor does any one doubt that he just as honestly believed in the reality of his spiritual impressions as he did in the reality of the civil code or of Blackstone's commentaries. He also published important law reports.

EDMONDSON, a co. in central Kentucky, watered by Green river, crossed by the Louisville and Nashville railroad; 225 sq.m.; pop. '70, 4,459—226 colored. The surface is uneven; soil tolerably fertile; coal is abundant. The chief productions are corn and tobacco. The great attraction of the co. is the famous Mammoth cave. Co. seat, Brownsville.

EDMONSTONE ISLAND, an outpost, as it were, of the delta of the Ganges towards the bay of Bengal, is situated at the mouth of the Hoogly, the most westerly arm of the great river above mentioned. It is the arena of the continuous conflict between the fluvial currents and the oceanic tides. From being merely a sand-bank, it came, not many years ago, to be covered with shrubs, and even to yield a supply of fresh water. After having been adopted, under this new phase, as a marine station, it has since then been abandoned, in consequence of the encroachments of the sea. E. I. is in lat. 21° 32′ n., and long. 88° 20′ east.

EDMONTON, a large village in the n.e. of Middlesex, near the Kerr, 7 m. n.n.e. of London. Pop. of parish '71, 13,860. It contains many villas of London merchants, etc. Charles Lamb is buried in the churchyard here. E. is connected with Cowper's humorous poem of *John Gilpin.*

EDMUND I., or EADMUND I. (Atheling), 922–46; son of Edward the elder, grandson of Alfred the great, and king of the Mercians and West Saxons, succeeded Athelstan (his brother) in 941, at the age of 18. He had shown remarkable bravery three years before in the battle with the Danes at Brunanburg. At the time of his succession the Northumbrians brought over from Ireland Anlaf, a Danish king of Dublin; the Danes joined them, and Edmund was compelled to make a large cession of territory. After the death of Anlaf, Edmund freed his own kingdom, subdued the Britons of Cumberland, and gave their territory to Malcolm of Scotland to secure his co-operation in military service. Edmund was assassinated by an outlaw May 26, 946, while at a banquet.

EDMUND, Saint (Edmund Rich), 1190–1240; b. Abingdon, England; the son of a mother whose piety amounted to ascetic fanaticism, and from whom he learned to become a self-tormentor. He got a tolerable education at Oxford, where he became a teacher in the university. His tendency of mind was to theology, so he became a priest, and was the first Englishman to receive the title of doctor of divinity. In 1227, he was one of the preachers of the sixth crusade. In 1234, he was consecrated archbishop of Canterbury. In 1236, he married king Henry III. to Eleanor, daughter of the count of Provence; but he was soon at enmity with the king, who induced the pope to send to

England a legate who should have authority above that of Edmund. The latter was now in disfavor with both king and pope, and made a journey to Rome to effect a reconciliation; but he was insulted by the pope, and returned to England broken in spirit and resources. In 1240, he went to Pontigny, France, where the queen of France and her sons came to receive his blessing. To find improvement in health, he went to Soissy, where he died. His tomb became immediately famous for miracles, and six years after his death, the man who had always protested against the robbery of the people by the church was proclaimed a saint by the act of canonization.

EDMUND IRONSIDE, king of the Anglo-Saxons, son of Ethelred II., and half-brother of Edward the confessor, was b. in 989. He calls for notice chiefly as the great opponent of Canute and the Danish party. On the death of Ethelred, the Danes proclaimed Canute king of England; but the citizens of London declared for E., who drew together his forces, and engaged Canute, first at Pen, in Dorsetshire (or, as other accounts say, at Gillingham, in Somersetshire), then at Sceorstan, and again at Ottenford, or Otford, in Kent, in all of which battles he was victorious; but a severe defeat which he sustained at Assandun, in Essex, compelled him to compromise with his adversaries. An arrangement was entered into by which England was divided between the two kings, Canute obtaining possession of Mercia and Northumbria, the rest falling to the share of Edmund. It was also agreed that on the death of either, the survivor was to succeed him. E. having died a few weeks after this agreement had been drawn up, Canute became king of all England. E. received the surname of *Ironside,* either from his great strength or from the color of his armor.

EDMUNDS, a co. in central Dakota, formed after the census of 1870. It is in part occupied by the Plateau du Couteau du Missouri.

EDMUNDS, GEORGE F., b. Vt., 1828. Besides a common school education he had the advantage of a private tutor; studied law at an early age, and was admitted to the bar in 1849. He settled in Burlington in 1851, and in 1854, and successively for four years, he was chosen to the popular branch of the state legislature, for three of the five years being speaker of the house. In 1861-62, he served in the senate, where he was speaker *pro tem.* When the rebellion broke out he was a member of the state convention which met to form a coalition between the republicans and the war democrats, and he drew up the resolutions adopted by that convention as the basis of union. At the death of Solomon Foot, Edmunds was appointed to fill the vacancy from Vermont in the U. S. senate, and taking his seat, April, 1866, has been regularly re-elected ever since. In the federal senate he has served on the committees on commerce, public lands, pensions, retrenchment, the judiciary, etc. He was a delegate to the Philadelphia "loyalists'" convention in 1866. He has been for several years at the head of the judiciary committee of the U. S. senate. During the spring of 1880, his name was freely mentioned for the republican presidential nomination.

EDMUND'S (ST.) **HALL,** Oxford, derives its name from St. Edmund, archbishop of Canterbury in the reign of Henry III. As early as 1269, it appears to have been purchased by the canons of Osney, and devoted to purposes of education. On the dissolution of religious houses under Henry VIII., it fell into the hands of two citizens of Oxford, who sold it to William Denyse, provost of Queen's college. The provost devised it to his college, and that society accordingly now nominates the principal of St. Edmund's Hall. There are ten exhibitions attached to the hall, value £30 per annum, appropriated to students designed for holy orders, and in the gift of the principal. In 1875, there were 136 names on the books.

E'DOM (New Testament, IDUMÆ'A), a word signifying "red." It was, according to Gen. xxv. 29-34, the name given to Esau on account of the *red* pottage supplied to him by his brother Jacob. Hence, the country which Esau afterwards obtained was called the land of Edom, but previously Mount Seir. The ruddy hue of the mountain-range, however, may have had something to do with the naming of the region. E. comprised a strip of country 100 m. long by 20 broad, lying between the s. of Palestine and the gulf of Akabah (an arm of the Red sea). It is a wild, mountainous region, with the desert on the e. and w. of it; but rugged though it looks, it contains rich glens and terraces, where flowers, and shrubs, and trees spring up luxuriantly. Its capital was Bozrah (now Buseirah), in the extreme north; its seaports were Elath and Eziongeber, in the extreme south, at the head of the gulf of Akabah. During the reigns of David and Solomon, E. appears to have been under subjection to the Israelites; but when the kingdom of Israel began to decline, the Edomites repeatedly ravaged the southern borders of Palestine, which circumstance is perhaps the reason why they are so terribly denounced by some of the prophets. At a later period, the term Edom (now giving way to the Greek form Idumæa) designated the region between the gulf of Akabah and the Mediterranean, including a part of the s. of Palestine. The revival of Jewish power under the Maccabean princes once more brought Idumæa under Jewish sway. The people were compelled to conform to the laws and customs of their conquerors, and the country was for the future ruled by Jewish prefects, one of whom, called Antipater, who was born in the country, acquired the friendship of the Roman emperor, and was appointed procurator of all Judea. His son was the famous Herod

the great, "king of the Jews." In the 7th c. A.D., E. was overrun by the Arabs, and has ever since shared the fortunes of Arabia.

EDRED, d. 955; king of the Anglo-Saxons, son of Edward the elder, and successor to Edmund I. He was victorious over the invading Danes in Northumbria. His nephew Edwy was his successor.

EDRIOPHTHAL'MATA (Gr., sessile-eyed), a section of the class of crustaceans, consisting of those *malacostracous* crustaceans which have the eyes sessile—not mounted upon stalks. They also differ from the other malacostraca in having the organs of respiration connected with the organs of locomotion; some of them, which constitute the two orders *amphipoda* and *læmodipoda*, having the respiratory organs connected only with the true or thoracic legs, whilst in the remaining order, *isopoda*, they are connected only with the abdominal or false legs. The E. are generally marine; many of the *amphipoda*, however, are inhabitants of fresh water; some of the *isopoda*—as the armadillo-louse and wood-louse—are terrestrial, but are inhabitants of damp places. Many both of the marine and fresh-water species spend their lives rather among the weeds and decaying matters of the shore than in the water, to consume these being apparently their office in the system of nature; some have organs adapted for leaping and for burrowing in the sand, as the common sandhopper (*talitrus locusta*), one of the *amphipoda*, of which countless myriads are to be seen on all our sandy shores, attracting the admiration of even the most careless; some burrow in more solid substances, as the *limnoria terebrans*, one of the marine *isopoda*, which too frequently effects the destruction of piers, dock-gates, etc., perforating them in every direction. Many of the E. are parasitic, some of them on whales, some even on prawns and other crustaceans. Some of the parasitic E. are destitute both of eyes and antennæ.

EDRISI, ABU ABDALLAH MOHAMMAD BNU ABDALLAH BNU EDRIS, AL-HAMUDI, SHERIF, also called AL EDRISI, AL-SIKILI (SICILIAN), or AL-RODJARI (ROGER'S), one of the most eminent Arabic geographers, and a descendant of the royal family of the Edrisites—who traced their origin to Mohammed himself—was b. at Ceuta or Sibta (Civitas) in the year 1099. He studied at Cordova, and early distinguished himself by the extraordinary range and versatility of his talents. He excelled in nearly all the then known branches of science and art; but it was geography which at a very early age seems more than any other science to have attracted him. Having completed his studies, he traveled and visited Constantinople, Asia Minor, Egypt, Morocco, Andalusia, and the coasts of France and England. Roger II., king of Sicily, invited him, on his return, to his court, and lavished upon him all the honors which it was in his power to bestow. A favorite wish of this monarch—one of the most refined and liberal-minded men of his age—had long been to have a representation of the earth, founded on the most recent observations. He accordingly invited travelers from all parts of the world to assist him by sending their itineraries, their measurements of longitudes and latitudes, their observations and adventures—in short, all they had seen or heard on their journeys. The collection of this material occupied 15 years, at the end of which it was handed over to Edrisi. Thus guided, he drew up a map, on a globe of pure silver, weighing 450 Roman pounds (50,400 drachmas), in which the whole of the then known world was represented. He, like Ptolemy, divided it into seven climates, beginning at the equinoctial line and continuing northwards to the limits of extreme cold, and intersected each of these with eleven "regions," represented by perpendicular lines, without any regard to the political or physical features of the respective countries. In explanation of this map, he wrote a book (1153), *Nuzhat al-Moshtak*, etc., in which a full account is given of the towns, mountains, rivers, etc., proceeding from w. to e., according to the order of the climates. Careful as he was in observing and collecting, he could not, in the then state of society and communication, but fall occasionally into serious blunders; but on the whole his statements are peculiarly trustworthy; and being the clearest and most reliable exposition of the state of geographical knowledge in those days, the book remained the great and sole authority down to the time of the Portuguese discoveries. An extract of it was first edited at Rome in 1592, in Arabic, entitled *Nubian Geography*, and reprinted in the monastery of Khesruan, in the Lebanon, with Syriac characters, in 1597—both editions incorrect in the highest degree. The very title was a mistake, the editors having, by a misinterpretation of a passage, been led to believe that E. was a Nubian. Bernardino Baldi translated this extract into Italian in 1600, but his translation was never published. The first published translation was a Latin one, made in Paris (1619) by Gabriel Sionita and Johannes Esronita, a work teeming with the most absurd blunders; and Domenico Macri translaled this Latin translation into Italian. Rosario Gregorio's Latin version of the portion referring to Sicily was published with the text in a collection of Tardia in 1790. Portions of the Arabic text, with comments, have been separately published; the chapters relating to Africa and to Spain by Hartmann (Göttingen, 1796); those concerning Syria by Rosenmüller (1828); and those on Africa and Spain again by Dozy and Goeje (Leyden, 1866.)

The translation of E.'s whole work, in French, was made from two MSS. in the imperial library, by Jaubert, and published (Paris, 1830 and 1840), but it is, unfortunately, not sufficiently faithful. The full text has never been edited.

We shall only add that the incidents of E.'s life have given rise to interminable dis-

cussions. The year and place of his death, as also his creed, whether Mohammedan or Christian, still remain vexed questions. Chief authorities regarding E. are Hadji Kalifah, Schnurrer, De Sacy, Slane, Quatremère, Reinaud, Amari, etc.

EDUCATION is an art, the art, namely, of drawing out (Lat. *educere*) or developing the faculties—of training human beings for the functions for which they are destined. Now, in order to the perfection of an art, it must be founded on a corresponding science; and of nothing is this more true than of education. Before we can hope to mold a human being in a desired way, the nature of that being must be well known. The knowledge of man's nature is usually comprehended under three divisions: the constitution of his body (physiology); the constitution of his mind (psychology); his moral and religious nature (ethics and religion). If we suppose these branches of knowledge thoroughly investigated, they would furnish the solution of the two main points on which all questions of E. turn: first—What are the dispositions and acquirements which it is most desirable to implant and foster? in other words, what is the end or aim that the educator ought to pursue? and second—What are the best means to attain that end? But the sciences above named are themselves in too imperfect and unsettled a state to be the basis of any theoretical plan that would be generally accepted; for our knowledge of living beings, and still more of moral beings, must, as is now well understood, be the last to acquire the shape and certainity of science. See SCIENCE. It is needless, therefore, to look as yet for any complete theory or *philosophy of education*. E. has existed as an art from the very infancy of society, but it is as yet mostly an empirical art, the rules and methods of which have been arrived at by the blind groping of experience—by the process of trial and error. The art of E. is still in the condition in which the art of agriculture was until the present century, when, by the aid of chemistry and vegetable physiology, then arriving at something like perfection, a scientific foundation was laid for it by Liebig and others. Even were the sciences of physiology, psychology, and ethics, on a more satisfactory footing, they would not be immediately serviceable as a foundation for a theory of E., without a preliminary step. This would consist in deducing from them an intermediate science, embodying the *laws of the formation of character*. According to J. S. Mill, it is a body of doctrine of this nature, to which he proposes to give the name of ethology (Gr. *ethos*, habit, custom), that would properly be "the science of which education is the art." But so far is such a science from being yet constructed, that it is only lately that the necessity for it has been pointed out. Notwithstanding this lack of scientific foundation, the practical art of E. has, in recent times, undergone great improvement in almost all its details. It is chiefly in discussions on the subject that the want of fixed scientific principles makes itself felt. A debate on any topic connected with E. usually presents little but a hopeless chaos of conflicting opinions, the most inconsistent arguments being often urged in favor of the same view. What renders the confusion greater, E. is a subject on which every one thinks himself or herself capable of pronouncing an opinion. But this is only another indication of the want of fixed scientific principles. No one presumes to meddle with a question of astronomy or of chemistry unless he has made it the study of a life. In like manner, it is to be hoped that, in proportion as we advance to a philosophy of E., there will be fewer who will take upon themselves to settle off-hand the most difficult questions regarding it.

In the present article, we can do little more than notice the chief divisions into which the subject of E. naturally falls, together with the leading questions that give rise to differences of opinion.

Definition.—It is necessary at the outset to limit the application of the term education. In the widest sense of the word, a man is educated, either for good or evil, by everything that he experiences from his cradle to his grave. But in the more limited and usual sense, the term E. is confined to the efforts made, of set purpose, to train men in a particular way—the efforts of the grown-up part of a community to inform the intellect and mold the character of the young; and more especially to the labors of professional educators, or schoolmasters. It is evident, however, that school E. cannot be understood or practiced rightly except by those who have mastered the idea of E. in its widest sense. It is only the educator who can appreciate the influences which have gone before his own, which are running parallel with them, and will come after them, that is in a position to judge of the course to be pursued.

Moral Training.—The means employed in E. fall naturally under two heads: discipline, or moral training; and instruction, or the imparting of information; although the two often run into each other. Under the head of discipline, come the forming of habits of order, self-control, obedience, civility, love of truth, and reverence for what is good and great. All but the mere outward forms of these is beyond the power of direct teaching; they are imbibed through the silent influence of example. The child instinctively respects and reverences what it sees others respect and reverence; above all, the unselfish affections are called forth only by the breath of affection from without. In this part of the process, it is evident that the school and the professional educator only play a part along with other influences. Nor do they even play the chief part; the home and neighborhood are here the predominent educators.—We cannot here enter into the vexed question of the teaching of religion in schools; it falls under

the head of NATIONAL EDUCATION; as does also the question between voluntary and state schools.

As the process of moral development, through the general surrounding influences, is for the most part unconscious on the part both of those who act and those who are acted upon, it has not yet secured the attention it deserves; in fact, the other branch of the subject, viz., instruction, or intellectual E., being more particularly the business of the schoolmaster, has come in common language to usurp the whole field, so that, by E., we seldom mean more than the imparting of information—instruction.

Instruction.—The business of instruction involves two main considerations—1. What to teach? and 2. How to teach it?

1. Of the vast mass of truths composing the sum of human knowledge, which are to be selected as the *encyclopædia* or curriculum of study for youth? In determining this question, it is to be borne in mind that every truth learned serves two uses—as knowledge to be acted upon, and as mental discipline. In selecting, then, what to teach, we have to consider, not only what is in itself most useful, but also what has the greatest degree of improving effect. On this point, we agree with a recent writer, that "we may be quite sure that the acquirement of those classes of facts which are most useful for regulating the conduct, involves a mental exercise best fitted for strengthening the faculties." If this is true, the prominence given to the teaching of the dead languages of Greece and Rome, in modern E. generally, is more than questionable. It is not disputed that a course of the classics, well taught and well learned, is a good intellectual discipline; but so is any kind of knowledge well taught and well learned, a good intellectual discipline—better than more valuable knowledge imperfectly taught and learned. The question is, whether an equally good culture of the faculties would not be got from a systematic course of equal duration of English and other modern languages, together with logic and moral and physical science. In this case, the subject-matter of the teaching would be an acquisition of great value in after-life to every one, which cannot be said of the other. In the learned professions, no doubt, and for those following literary pursuits, a knowledge of Greek and Latin is of direct use, and will doubtless continue an indispensable element of E.; but perhaps three fourths of those who receive what is called a "liberal" E., and therefore devote the strength of six or seven years to Greek and Latin, never open a book in these languages from the time they leave school. We are not prepared to maintain that the same effects in the way of discipline have as yet been actually produced, on any great scale at least, by the teaching of science and of modern languages, as result from the drill of the classical schools; but we believe that this arises from the fact that no such course of instruction has hitherto been pursued with the same system and perseverance which characterize classical schools.

In respect of direct utility, the things most necessary to know, are those that bear most directly—

1. On the preservation of life and health, and the proper performance of the more common industrial labors. This involves a knowledge of our own bodies and of the bodies of which the universe is made up; in other words, more or less of the knowledge which, when put into systematic forms, is known as the sciences of physiology, natural philosophy, and the other physical sciences.

2. A knowledge of our moral relations. Besides a knowledge of the ordinary moral duties, and the high religious sanctions with which they are enforced, this implies some acquaintance with the laws of economy.

3. As a preliminary step, and as the medium through which all other knowledge is conveyed, there is required a knowledge of the mother-tongue, and the faculty of reading and writing it. Allied to language is a knowledge of counting and measuring, and the naming and classifying of the objects of which the world is composed (natural history), together with a knowledge of the countries and places on the earth's surface (geography).

4. The cultivation of the taste and the imagination, or the faculties which derive pleasure from music, painting, sculpture, architecture, poetry, and works of fiction.

Under the head SCIENCE will be given a complete tabular view of the various branches of human knowledge or sciences, together with the corresponding arts or applications. It will there be shown that there is a natural order of dependency among the fundamental sciences, which determines the order in which the different kinds of facts should be taken up in learning. (An admirable mapping out of the whole field of knowledge in relation to E., is given by Dr. Neil Arnott in his *Survey of Human Progress* (Lond. 1861).

The different offices and employments characteristic of an advanced state of society, require a corresponding difference in the amount of knowledge and skill possessed by those who are to fill them—a difference which is vaguely and inadequately expressed in the usual division of schools into primary schools, middle or higher schools, and universities.

A course of primary instruction embraces only what is considered absolutely indispensable. Not that there is a limit to the degree of intelligence that is desirable in any class of the community; but for those who must, from early years, spend most of their time in manual labor, i.e., for the vast majority of the race, there is a very short limit

to the degree possible. The grand question here would be to determine the order of desirableness of the different subjects to be taught, so that, beginning with the most indispensable, more and more might be added as circumstances would permit. Until recently, reading, writing, and arithmetic were considered the beginning and end of a course of primary instruction. These, however, are not so much knowledge themselves as instruments for acquiring knowledge; and therefore the primary teacher in the present day considers it his duty to give, in addition, as much information of a directly useful kind as possible. But in avoiding one error, he not unfrequently falls into the opposite; for, after all, the three branches above named are the first and most indispensable steps in instruction. Those who can read and write may acquire information after leaving school. Reading and writing, unless learned at school, are, as a rule, never learned; and thus the grand access to knowledge remains for ever shut. Nor is it enough to have made a beginning in the arts of reading, writing, and counting; unless such a degree of facility is acquired before leaving school as to render the exercise a pleasure, it is not kept up in after-life, and the little that was learned is soon forgotten. We believe that in all schools, but especially where the children are liable to be early withdrawn, everything else ought to be held secondary until the painful stage in learning to read, write, and count, is fairly got over. With regard to the positive knowledge hitherto got in primary schools, there is a general feeling that few teachers succeed in giving it a direct bearing on the actual concerns of life. Hence the aversion expressed in many quarters to the introduction of the "ologies" into common schools, and the rather vague demand for the teaching of "common things."

Middle or secondary schools either serve for those who have leisure for a higher degree of culture than the elementary course above described, or they serve as nurseries for the highest kind of educational institutions, viz., the universities. Under the head of secondary schools may be ranged the institutions that go by the names of high schools, academies, grammar-schools (the *gymnasiums* of Germany, and the *colleges* of France). In these, the course of instruction usually embraces other languages besides the mother-tongue, and more or less of the elements of the various sciences. The titles of a series of text-books, such as those composing Chambers' *Educational Course*, give a notion of the great variety of subjects that are considered requisite in middle-class education. Much yet remains to be done to chalk out a judicious course of middle-class instruction —sufficiently wide to be a foundation for after-acquisitions, and yet not so multifarious and detailed as to be impossible to overtake except as ill-digested cram.—Where preparation for the university is the object, Greek and Latin are the chief subjects of attention.

The highest degree of culture is represented by the universities (q.v.).

Special or Technical Education.—Up to a certain point, the education of all young persons is, or ought to be, substantially the same; for the end in all cases is to train them up to be intelligent, virtuous, and active men and women, capable of turning their talents to account in whatever situation they may be placed. But in all civilized societies, the duties and employments are so diverse, that the members must begin betimes to receive special training, according to their future destination. This special training is either of an intellectual or a mechanical kind, or it may partake of both. This branching off of education into special tracks is conspicuous in the higher education given in universities, where from the very first there have been—besides the faculty, as it is called, of philosophy, including a number of branches of a general nature—special departments or faculties of law, medicine, and theology. But besides these "professions," as they are styled, a number of branches of industry have in recent times, by the application of scientific processes, and from other causes, risen into a condition which requires, at least for those who are to direct them, a special range of instruction and information; such are engineering, mining, chemistry applied to the arts (technology), for which special schools are now established in most centers of industry. There are two "specialties" which, from the immense numbers engaged in them, assume unwonted importance—namely, agriculture (see AGRICULTURAL SCHOOLS) and commerce. So prominent a place does commerce hold in this country, that any school which is above an elementary school, and at the same time not a classical school, usually gets the name of commercial. The chief points in a special education for the mercantile life are usually held to be, facility in writing and calculating, and a knowledge of book-keeping. What would seem to be the most essential part of a mercantile education, is usually neglected —the principles, namely, of political economy—the science of wealth.

Industrial Education.—The acquiring of mechanical skill for a particular handicraft or occupation—in other words, apprenticeship—is, properly speaking, a part of education; but as it is not usually begun until the school education is considered finished, it hardly falls within our province. Yet the abrupt separation of these two stages is attended with evils that are beginning to make themselves felt. For, first, the poorer classes, either from necessity or cupidity, are induced to withdraw their children from school as soon as the provisions of the acts dealing with education will permit them, so that they may as early as possible turn the capabilities of their children to practical account. When to this is added the irregular attendance even during the few years that they are nominally at school—and this is a difficulty which even the recent elementary education acts have not been able wholly to subdue—the result is, that this class remain to a great extent uneducated; comparatively few have got over the initial mechan-

ical difficulties of reading and writing, so as to keep up the habit in after-life, and thus they soon lose the little acquirements they had made.

On the other hand, to continue the intellectual and moral E. of youth up to the age of 14 or 16, as is the common practice among the middle classes, and among the well-to-do of the artisan class, and then abruptly to break this off, and begin at once an industrial occupation on the full time of an adult who has been used to the work, is, on the face of it, an irrational way of proceeding. The power of applying steadily, day after day, to one occupation, is the hardest lesson for man to learn; it is that which, more perhaps than anything else, distinguishes civilized man from savage and semi-barbarous man; and as the boy is "the barbarian of the civilized community," this aversion to steady industry is yet strong in him. It is surely wise, then, to break him into it gradually; to begin, while yet his school E. is going on, by short exercises of his industrial faculties at first, and gradually increase the daily hours of work as his physical strength and powers of will become hardened. We believe that many a youth who, on the usual system, breaks down at the very commencement of his industrial career, runs away from his apprenticeship, and becomes unsteady, idle, perhaps a *scamp*, for life, might, by a gradual initiation, have become an industrious man and good member of society. So far, again, would this plan be from infringing upon the usual E. given at school, that it is only in some such way that, in a country like ours, the school E. of those who have to earn their own bread can be prolonged to the age necessary for learning much that every member of the community should know.

Theoretically, we believe it to be indisputable, that school E. and industrial training ought, for some time at least, to be conjoined. How to make them dove-tail into one another in practice, is one of the chief educational problems of the day. One step towards it has been made in the *half-time system* enforced by act of parliament with regard to children employed in factories. Children may be employed as early as the age of 10 years, but all between the ages of 10 and 13 (or 14 if the child have not a certificate of educational proficiency) are limited to half-time daily either forenoon or afternoon, or to whole-time every alternate day; nor can they be employed even in these ways but on condition of receiving three hours' schooling daily, or the usual school hours every alternate day. Experience has established the fact, that in proportion to the hours spent in school, these "half-timers" make more rapid progress than the whole-day scholars; at the same time, whether they are destined to be factory-workers for life or not, they are acquiring habits of industry and manual dexterity which are of essential use in any future employment.

Industrial training is now conjoined, to a greater or less extent, with school-teaching in almost all institutions for the E. of pauper children—parochial union schools, ragged schools, as well as in professedly industrial schools. See INDUSTRIAL SCHOOLS, RAGGED SCHOOLS, REFORMATORIES. The chief difficulty in this movement is to find fitting work. And here it may be observed, that the object is not to teach particular trades with a view to the boys following these in after-life; this, though it were desirable, would obviously be impracticable as a general system. The object is, to promote the health, to develop the muscles, and to induce habits of steady and patient endurance of work.

The industrial training of girls is of yet more urgent necessity than that of boys. The ordinary domestic operations involved in household management ought naturally to be learned at home under the guidance and example of the mother; and the object at school, in a right and normal state of things, would be to initiate the girls in things, in the way of improvements, that their several homes might not exhibit—to insure progress, in short. But unhappily, in the homes of the great mass of the operative population of these islands, the mother is at present quite unfit for this primary duty. The extension of the factory system of work, instead of the domestic, has revolutionized the domestic life of a great part of the operative population, and with our *laissez-faire* policy in E., we have allowed a generation to spring up, in which a great part of the married women have lost whatever traditional housewifery their mothers might have had, and can neither cook, wash, nor sew. The consequence is, that the food of the household is unsavory, indigestible, innutritious, and at the same time unthrifty; while the whole *ménage* has that character of untidiness and discomfort that often drives the husband to the pot-house. For girls of this class, there is needed a training in some public institution in the very elements of housewifery; while, for all classes, there is great need for instruction in a better style of cookery than that generally prevalent. The public mind has at last become awake to this necessity, and domestic economy has been made an essential element in primary schools for girls in Great Britain. See DOMESTIC MANAGEMENT.

2. "How to teach it."—It is a great error to suppose, that because a man knows a thing, he can therefore teach it. Teaching is one of the most difficult arts, and requires natural aptitude and acquired skill. The necessity of special study and practical training or apprenticeship to make a schoolmaster, is a discovery of recent date, and has given rise to teachers' seminaries or normal schools (q.v.), where they receive special instruction in the most approved methods of teaching, and practice in their application. It is to the greater acquaintance with right methods, on the part of schoolmasters, that we are to look for the solution of one of the greatest difficulties—how, namely, to over-

take all the work that is necessary to be done in the school-period of life, without keeping the learners too many hours a day at their tasks. As things are usually managed, very little of the time devoted to lessons is spent in actually learning anything whatever; as any one may satisfy himself by calling to mind how his own time was spent while seated on the school-benches. There is here a rich mine waiting to be worked—the gold-fields of future generations. It is not to be disputed, that three hours of hearty, spirited exertion will do more, in the way of learning, than is accomplished in six hours in most schools. The three hours thus set free would be clear gain; for time spent in trifling or in heartless fagging is utterly lost. The child is all the while plagued without being profited, and would be better employed in being happy in his own way. This matter of the happiness of the young has not yet received the attention it deserves in schemes of education. As Sidney Smith has well expressed it, "if you make them happy now, you make them happy twenty years hence, by the memory of it;" so that while looking after the formation of other valuable habits, the educator must not overlook the habit of happiness.

Increased economy of time in teaching, besides setting free sufficient time for play, would admit the more general introduction into school education of military drill (including gymnastics). This, in addition to its immediate purpose (see VOLUNTEERS), would be a most valuable aid in moral education, by promoting habits of prompt obedience, order, and politeness. On this subject, see *Communications from Edwin Chadwick, Esq., respecting Half-time and Military and Naval Drill*, made to the education commission, and printed among parliamentary papers, 1861.

For further information on the subject of this article, see, in addition to the references already given, the heads INFANT SCHOOLS, EVENING SCHOOLS, MONITORIAL SYSTEM, PESTALOZZI, HAMILTONIAN SYSTEM, NATIONAL EDUCATION.

EDUCATION, COMMISSIONER OF, the chief officer of the bureau of education, at Washington. He is appointed by the president and senate, and his duties are "to collect such statistics and facts as shall show the condition and progress of education in the several states and territories;" to diffuse such "information respecting the organization and management of schools and school systems and methods of teaching as shall aid the people in the maintenance of efficient school systems, and otherwise promote the cause of education;" and also "to present annually to congress a report embodying the result of his investigations and labors, together with a statement of such facts and recommendations as will, in his judgment, subserve the purpose for which the department is established."

EDUCATION, MILITARY, is now superintended, so far as concerns regimental schools, by a particular department of the war office. In this sense, it does not really mean military education, but schooling of a humble kind supplied to soldiers and their children. In its proper sense, the term relates to the professional training of those destined to be officers in the army. This is not to so great a degree under government control in England as in continental countries. See ARTILLERY, SCHOOLS OF; CADETS' COLLEGE; CROYDON (Addiscombe); DUKE OF YORK'S SCHOOL; MILITARY SCHOOLS; REGIMENTAL SCHOOLS; SANDHURST; STAFF COLLEGE.

E'DUCT is a term employed in chemistry to indicate that the body to which it is applied is separated by the decomposition of another in which it previously existed as such. It thus stands in opposition to *product*, which denotes a compound not previously existing, but formed during decomposition. Thus, the volatile oils which pre-exist in cells in the fruit and other parts of plants, and oil of sweet almonds obtained by pressure, are educts; while oil of bitter almonds, which does not pre-exist in the almond, but is formed by the action of emulsion and water on amygdalin, is a product.

EDUR', a rajput state of Guzerat, is tributary to the guicowar, being, in common with his immediate dominions, subject to the political superintendence of the presidency of Bombay. With a revenue of nearly £25,000, it maintains a force of about 1000 men. Its capital, of the same name, contains about 10,000 inhabitants; and the pop. of the state was in 1872 estimated at nearly 220,000.

EDWARD, or EADWARD, I. (THE ELDER), d. 925; king of the Anglo-Saxons, eldest son of Alfred, succeeded his father in Oct., 901, when about 30 years of age, having previously distinguished himself by defeating the Danes. His cousin Ethelwald, who disputed Edward's right of succession, and endeavored to obtain the throne, was killed in battle. The reign of Edward was turbulent, but at length he thoroughly subdued the Danes, those of Northumbria, as well as the Scots, and the Welsh accepting him as their "father and lord." He carried the Anglo-Saxon rule to a power before unknown.

EDWARD, or EADWARD, II. (THE MARTYR), d. 978; king of the Anglo-Saxons, succeeded his father Edgar in 975 A.D., at the age of 13. His succession was contested in behalf of his younger brother, only 7 years old; but the powerful influence of St. Dunstan secured Edward's triumph. He died by treachery. Returning exhausted from the chase he was lured to the residence of Elfrida (the mother of the contesting prince) and there stabbed in the back.

EDWARD THE CONFESSOR, king of the Anglo-Saxons, was b. at Islip, in Oxfordshire, about the year 1004. On the death of his father, Ethelred, in 1016, Canute the

Dane obtained possession of the throne, and in the following year married Emma, the mother of Edward, by whom he had two sons, Harold and Hardicanute. Until the death of Canute in 1035, E. lived in Normandy; he then made an ineffectual attempt to establish his authority in England; but his mother Emma had now transferred her affections to her younger children; and she exerted all her influence and energy in favor of Hardicanute, who, on the death of his brother Harold in 1040, became sole ruler of the Anglo-Saxon kingdom. Hardicanute, however, was generous enough to invite his half-brother to England, whither accordingly E. went, and was honorably received. On the death of Hardicanute in 1042, E. was declared king. The person chiefly instrumental in bringing about this result was earl Godwin, whose only daughter, Editha, was married to the king in 1044. The lady only became his queen, not the partner of his bed. For this revolting asceticism, the honor (if it be such) of canonization, and the title of confessor, was conferred on him, about 100 years after his death, by pope Alexander III. Scrupulous as E. was in regard to one of the passions, he had no repugnance to gratify another of a far less justifiable kind. His first act after his accession, was to deprive his mother of all her treasures—lifting even the cattle and corn from her fields, and, according to some accounts, endeavoring to compass her death. The whole of E.'s reign is simply the record of the growth and struggles of the Norman or court party with the national or Anglo-Saxon party; for an account of which see articles Godwin and Harold. E.'s wars with the Welsh in 1057 and 1063, and with the Northumbrians in 1065, were short and successful. He died 5th Jan., 1066, and was succeeded by Harold, son of earl Godwin. The prosperity which England enjoyed during the reign of E. was owing to its not being exposed to the wasteful calamities of foreign invasion, while its free intercourse with France, or at least with Normandy, greatly civilized and refined the somewhat Bœotian habits and manners of its inhabitants.

EDWARD, the Black Prince (Edward III. *ante*), 1330–76; son of Edward III. of England, and Philippa. He was created duke of Cornwall in his eighth year, and a year later, during his father's absence in France, was appointed nominal guardian of the kingdom. He held this office also in 1340 and 1342; and was created prince of Wales on the king's return in 1343. Three years later he accompanied his father to France, and in the battle of Crécy led the most victorious division of the army. He also shared his father's glory in the victory over the Spanish fleet at the battle of L'Espagnols-sur-Mer. In 1355, he was given command of the chief army in the French war, landed at Bordeaux, and after several smaller successes, in 1356 he gained the victory of Poictiers, capturing the French king, whom he carried captive to London in 1357. In 1361, during the short peace following king John's ransom, he married his cousin Joanna, the "fair maid of Kent," of whom he was the third husband, and being created duke of Aquitaine, crossed over to his new dukedom, where he ruled successfully and peacefully for a time. Making an entangling alliance with Pedro, the deposed king of Castile and Leon, although victorious he found himself burdened with the expenses and losses of a profitless war, and for the excessive taxes laid upon his duchy he was summoned to account at Paris. To this summons he replied haughtily that he would come "helm on head, and with 60,000 men." This led to a rupture between France and England. The French planned a double invasion of English territory. The duke of Anjou, commanding one expedition, besieged Limoges, which had been ceded to the English by the treaty of Bretigny and formed part of the principality of Aquitaine. The city surrendered by the treachery of its bishop. The black prince, enraged by this act, after a siege of a month, recaptured the city by assault, and put to the sword 3,000 of its inhabitants. This madness of cruelty is the chief blot on the fame of the prince. It is only partially explained by his disordered health, which itself was perhaps due to the irritation of seeing the English power waning in France, in spite of all his victories. He was compelled, by the advice of his physicians, to return to England the following year, 1371, where he lingered in continually failing health for five years. In these years he saw the loss of Aquitaine to England, but he did good service to the country in opposing the corrupt and oppressive influences which surrounded the king, and by his help parliament was able to pass acts against the king's mistress, Alice Ferrers, and in restraint of the dangerous ambition of John duke of Lancaster. These patriotic services endeared him to the people, and before his death he had regained the popularity of his earlier years. His mailed effigy marks the place of his burial in Canterbury cathedral.

EDWARD I., King of England, was the eldest son of Henry III. by his wife Eleanor, daughter of Raymond, count of Provence, and was b. at Westminster, June 16, 1239. That union of valor and intelligence which characterized him was exhibited at an early period. At the commencement of the struggle between Henry and his barons, prince E., who was then governor of the duchy of Guienne, came over to England, and boldly declared his dissatisfaction with his father's conduct. Subsequently, he took the king's side in the war, and by his vigorous generalship put an end to the insurrection in a few years, but there is no evidence to show that he had changed his opinion of Henry's policy; and it is remarkable that he himself, during the whole of his reign, carefully avoided coming into collision with his nobles. When the last of the crusades was organized, at the instigation of pope Gregory X., prince E. arranged with Louis, king France, to take part in it. Louis died before reaching Palestine, but the former landed

at Acre in 1271. Nothing, however, of any consequence was achieved; and in the following year he set out on his return to England. At Messina, he heard of his father's death, whereupon he proceeded to France, and did homage to Philippe III. for his French possessions, arriving in England 25th July, 1274. He and his queen, Eleanor, were crowned at Westminster on the 19th of Aug. following. His first military expedition, after his accession to the throne, was directed against the Welsh. After a contest of nearly 10 years—in the course of which the famous prince Llewellyn was slain at Llanfair, 11th Dec., 1282—Wales was finally subdued and incorporated with England. His next ambition was to possess himself of Scotland. The death, in 1290, of Margaret, granddaughter of Alexander III., and known as the maiden of Norway, who was to have been married to E.'s son, seemed to have frustrated his design; but the selfishness of the 10 competitors for the Scottish crown who now appeared, induced them to acknowledge E. as *Lord Paramount* of Scotland, each hoping that he would thereby secure the English monarch's support. The competitors were also foolish enough to make him umpire among them, or perhaps it would be more correct to say, they were not powerful enough to refuse his arbitration. Be that as it may, E. decided in favor of John Baliol at Berwick, 17th Nov., 1292; and Baliol immediately took the oath of fealty to him; and on the 26th of Dec. did homage to the English king for his crown at Newcastle. The patriotism and pride of the Scottish nation took fire at such humiliation, and in a short time Baliol was hurried by his subjects into a war with England. In 1296, E. entered Scotland, devastating it with fire and sword. He penetrated as far n. as Elgin, compelled Baliol to resign the kingdom, and governed the country by means of his own officers. It was during this expedition that he carried off from the cathedral of Scone the celebrated stone on which the kings of Scotland used to be crowned, and which is now in Westminster abbey. A second rising took place in Scotland in the following summer. The leader on this occasion was William Wallace (q.v.), whom tradition represents as the most heroic and unselfish of patriots. He was completely successful for a time, chiefly it is to be supposed on account of the absence of Edward. In the spring of 1298, however, that sovereign again made his appearance in Scotland, and gave battle to Wallace at Falkirk, on the 22d of July. Partly through treachery, and partly, no doubt, through the superior generalship of E., who is considered to have been the first military commander of his time in Europe, the Scottish forces were entirely defeated. The next five years were spent by the English king in reducing the country to obedience—with very imperfect success, however. In the summer of 1303, he led a third large army into Scotland, and once more spread havoc and ruin to the shores of the Moray firth. The last castle that held out against him was Stirling, which did not yield till the 20th of July, 1304. E. wintered at Dunfermline. Some time after this, Wallace either fell into his hands, or was betrayed, and on the 23d Aug., 1305, was hanged, drawn, and quartered as a traitor, at Smithfield, in London. E. now probably thought that he had no further danger to dread from Scotland, but if so, he was quickly undeceived. Robert Bruce, earl of Carrick, grandson of the chief rival of Baliol, suddenly left the English court, where he had been residing, in the beginning of 1306, unfurled once more the banner of Scottish independence, and on the 27th Mar. of that year was crowned at Scone. An English army, under the earl of Pembroke, was immediately despatched to Scotland; and at the close of the year, the king himself set out to chastise Bruce. But worn with the "sturt and strife" of many years, the cares of his own kingdom, and the anxieties of conquest, E. only lived to reach Burgh-on-Sands, a village beyond Carlisle, where he expired, 6th July, 1307, "in sight of that country," says lord Hailes, "which he had devoted to destruction."

E. possessed most of the qualities that go to form a great ruler: valor, prudence, inexhaustible energy, and pertinacity are visible in his whole career. He was ambitious, it is true, but in his age, ambition was looked upon as a virtue rather than as a crime; it was the natural accompaniment of kingly courage. His relations to Scotland were also unfortunate. Few people of any understanding, however, now doubt that the best thing possible for that country would have been a peaceful union with England, for at that time there was no hatred or jealousy between the two nations. The death of the maiden of Norway destroyed every chance of such a union, and the great mistake committed by E. was his endeavoring to bring about by force what could prove beneficial only when it was the result of voluntary agreement. The effect of his mad endeavor was to plant in the breasts of the two nations the *germs* of a hitherto unknown hostility, which, in subsequent generations, worked incalculable mischief, and the traces of which have not wholly disappeared even at the present day. As a civil ruler, E. is entitled to the highest praise. Immense progress was made during his reign in the establishment and improvement of law and order throughout the land, the reformation of civil abuses, and the restriction of ecclesiastical jurisdiction and encroachments. He has been called the English Justinian; and both Hale and Blackstone affirm, that "the very scheme and model of the administration of common justice between man and man was entirely settled by this king." Ireland and Wales participated in the benefits of English law. It was during E.'s reign, too, that the representation of the commons of England first became regular; but probably the greatest advantage obtained by the nation, was the declaration that the right or privilege of levying taxes resided in the parliament. In general, it may be said that E. ruled in

harmony with the ideas and desires of the best heads among his nobles and burgesses; and though touchy on the question of his prerogative, like every Plantagenet, and very cruel in his treatment of the Jews, he must be regarded, on the whole, as one of the most enlightened, liberal, and sagacious monarchs of his age.

EDWARD II., son of the preceding, was b. at Caernarvon, in Wales, 25th April, 1284, and in 1301, was created prince of Wales, being the first heir-apparent of the English throne who bore that title. He accompanied his father on his various expeditions into Scotland, and on the death of the latter at Burgh-on-Sands, he led the English army as far n. as Cumnock, in Ayrshire, after which he returned to his own country. At home, E.'s conduct was contemptible. While still a youth, he had conceived an extraordinary admiration and fondness for a witty, clever, but dissolute creature called Piers Gaveston, the son of a Gascon knight. After he became king, there was no limit to the honors heaped on the favorite. When he went to France, in the beginning of 1308, to conclude a marriage with Isabella, daughter of Philippe V., king of France, Gaveston was left guardian of the kingdom. The nobles were indignant, and demanded his banishment. Twice was Gaveston forced to leave England, but as often was he recalled by the weak monarch, whose love for him was sheer infatuation. At last the nobles rose in arms, besieged Gaveston in Scarborough castle, and having forced him to surrender, hanged him at Warwick, 19th June, 1312. Two years after this, E. invaded Scotland at the head of the greatest army ever collected in England—amounting, according to some historians, to 100,000 men. At Bannockburn, on the 24th June, 1314, he was encountered by Robert Bruce (q.v.), and defeated with immense slaughter. This victory put Scotland and England on equal terms for all time coming, and made the notion of a military subjugation of the former country by the latter be given up. Finally, in 1319, after numerous petty successes on the part of the Scotch, E. concluded a truce with them for two years. He now exhibited again his imbecile passion for favorites. The person selected on this occasion was Hugh le Despencer. Once more the nobles rebelled, and both Hugh le Despencer and his father were banished in July, 1321, but some months after, were recalled by E., and many of the nobles, among others, the earl of Lancaster, were beheaded in the following year. Immediately after, E. invaded Scotland for the last time, and penetrated as far as Culross, in Fife; but having achieved no particular success, he concluded a truce with that nation for thirteen years, and returned to England. A dispute now arose between him and Charles IV. of France, brother of his wife Isabella, in regard to the territories which he held in that country. Charles seized them, whereupon E. sent over Isabella to remonstrate, and, if possible, to effect an amicable arrangement between them. Isabella, it would appear, despised her husband, and disliked the Despencers. Meeting at the French court many English nobles who, entertaining similar feelings, had left their country to avoid the enmity of the favorites, she was easily induced to make common cause with them against her husband and the Despencers. At the same time, she formed a connection of a criminal kind with Roger de Mortimer, one of the most powerful of the exiles. This of course more thoroughly involved her in the plot against Edward; and having obtained possession of the young prince of Wales, afterwards Edward III., she embarked from Dort, in Holland, with a large body of malcontents, and landed at Orwell in Suffolk, 22d Sept., 1326. The queen and the banished nobles were soon joined by all the influential persons in England. E. fled, but was taken prisoner at Neath abbey, in Glamorganshire; the Despencers, father and son, were executed; and the monarch himself, after being formally deposed, 25th Jan., 1327, was murdered in Berkeley castle, 20th Sept. of the same year. He left two sons and two daughters.

EDWARD III., son of the preceding, was b. at Windsor, 13th Nov., 1312, and ascended the throne, 25th Jan., 1327. During his minority, the country was governed nominally by a council of twelve nobles and bishops, but really by Mortimer and his paramour Isabella. On the 24th Jan., 1328, the young king married Philippa, daughter of the earl of Hainault; and two years after, resolving to take the power into his own hands, he seized Mortimer, and put him to death, 29th Nov., 1330, and banished his mother, Isabella, to her house at Risings (where she lived for twenty-seven years). He next invaded Scotland, to assist Edward Baliol, son of John Baliol, who, in the confusion that ensued on the death of the great Bruce, had made a descent on the country, and got himself crowned at Scone. A bloody battle was fought at Halidon hill, near Berwick, 19th July, 1333, in which the Scots were completely defeated. Baliol now assumed the authority of a king, and did homage to E. for his possessions, the result of which act was, that he had to flee the kingdom in a few months, for the thing most intolerable to the Scottish spirit was that any monarch should dare, or fancy he had a right, to surrender the independence of his country. In the course of three years, E. thrice invaded Scotland; but though he frightfully wasted the country, and brought armies with him such as could not be successfully opposed, he could not break the invincible spirit of the people, who, after each invasion had rolled over them like a flood, rose and rallied with a still more stubborn and impassioned resolution to be free. But the scene of E.'s great exploits was France. Charles IV. having died without a son, Philippe of Valois, the nearest heir by the male line, ascended the throne, under the title of Philippe VI. E. claimed the

crown in right of his mother Isabella, sister of Charles; but as the law of France expressly excluded females from enjoying sovereign rights, it is manifest that E.'s claim was utterly groundless. The English king admitted that his mother, being a female, could not inherit the crown of France, but affirmed that he, as her *son*, might. But it is clear that he could not receive from his mother rights to which she herself had no claim. Yet never was a bad cause ennobled with more splendid triumphs. E. declared war against Philippe in 1337. His first campaign was not very remarkable; but in 1346, accompanied by his eldest son, known as the black prince, he again invaded France, conquered a great part of Normandy, marched to the very gates of Paris, and on the 26th Aug., 1346, inflicted a tremendous defeat on the French at Crécy (q.v.). Here the black prince, though only sixteen, exhibited the courage and the prowess of a veteran, slaying with his own hand the king of Bohemia, who fought on the side of France. After some further successes, such as the reduction of Calais, a truce was concluded between the two nations for several years. Meanwhile, the Scots had sustained a severe defeat at Neville's Cross, near Durham, their king (David) being taken prisoner. In 1356, the war with France was renewed, and on the 19th Sept. of that year, the black prince obtained a brilliant victory at Poitiers, king John of France (Philippe having been dead for some years) falling into his hands. The Scotch monarch was released for a ransom of £100,000 in 1357, and king John in 1360, when a peace was concluded between the French and the English, by which the latter were to retain their conquests. King John, however, finding it not consistent with the honor or desire of his country that such a peace should be carried out, magnanimously returned to captivity, and died in London, 8th April, 1364. Shortly before this date, David, king of Scotland, whose residence in England had extinguished the little patriotism he ever had, entered into a secret agreement with E., in virtue of which his kingdom—if he died without male issue—was to be handed over to the English sovereign. Meanwhile, the black prince, who had married Joanna, daughter of the earl of Kent, had received from his father Aquitaine and Gascony, and ruled there for some time very prosperously; but ultimately involving himself and his father in a war with France, which was disastrous in its issues, he was obliged, in 1374, to conclude a truce for three years. E. waged war no more. In spite of his brilliant victories, in spite of the dazzling valor of his son, he was at the last unsuccessful. Neither in Scotland nor in France did he realize his desires. Affairs at home were no less unsatisfactory in the last years of his life. He quarreled with his parliaments, and the black prince led the opposition. The latter, however, died 8th June, 1376, in the 46th year of his age. E. himself expired on the 21st June, 1377, after a reign of 51 years. By his wife, Philippa, he had seven sons and five daughters, several of whom died young. He was succeeded by his grandson Richard, son of the black prince, who ascended the throne as Richard II.—The reign of E. was marked by the great progress made in law—a greater number of "important new laws being passed than in all the preceding reigns since the conquest." Among these laws were several indicating the increasing repugnance of Englishmen to ecclesiastical, and especially to papal jurisdiction. Trial by jury also now began to supersede other modes of trial. Justices of peace likewise make their earliest appearance in this reign, and legal proceedings were ordered to be carried on henceforth in English, and not in French. Sir James Mackintosh is of opinion, that though E.'s "victories left few lasting acquisitions, yet they surrounded the name of his country with a luster which produced strength and safety"—an opinion which appears, on the whole, to be well founded. It remains to be said that E.'s reign witnessed the culmination of chivalry, and in the black prince, possessed a splendid example of its virtues and its vices. The fine arts, especially architecture and poetry, also attained a grand development. Chaucer, Gower, and several eminent chroniclers, flourished at this time, and in the sphere of religious reform stands out the noble and thoroughly English figure of Wickliffe.

EDWARD IV., son of Richard duke of York, and great-grandson of Edmund duke of York, who was the 5th son of Edward III., was b. at Rouen, 29th April, 1441 (or, according to another account, in Sept., 1442). His original title was that of earl of March. It would be quite impossible, in the short space at our disposal, to clear our way through the jungle of family relations by which Richard duke of York, the father of Edward IV., traced his right to the throne. Suffice it to say, that in 1460 the bloody struggle between the *Yorkists* (the party headed by Richard duke of York, who *at first* professed only a desire to remove from the king, Henry VI., his pernicious councilors) and the *Lancastrians* (the party of the sovereign) ceased for a moment. The Yorkists, on the whole, had been victorious on the battle-field, and their leader contrived to induce parliament to appoint him Henry's successor. Shortly after, however, Henry's wife—the brave queen Margaret—raised an army in the n., and on the 31st Dec., 1460, encountered and overthrew York on Wakefield Green, the duke himself being slain. But this reverse was compensated for by the success of his son Edward, who, after routing the royal or Lancastrian forces, under the earls of Pembroke and Ormond, at Mortimer's Cross, near Hereford, marched towards London, which he entered on the 28th Feb., 1461. He immediately presented his claim to the crown to parliament, which admitted its validity, and on the 4th of Mar. ascended the throne as Edward IV., amid the acclamations of the citizens of London, with whom he was a great favorite. For three years

he had to struggle hard to keep his position. His first victory over the Lancastrians was obtained at Towton, in Yorkshire, 29th Mar., 1461, hardly one month after his accession. Finally, in May, 1464, a few days after the victory at Hexham, Henry himself fell into E.'s hands. This closed the war for a time. About this time, E. married Elizabeth Woodville, widow of sir John Grey. This marriage gave great offense to the earl of Warwick, by far the most powerful of E.'s adherents, who was at that time engaged in prosecuting an alliance between E. and the sister-in-law of Louis XI., king of France. In 1469, Warwick openly declared against him, joined queen Margaret, and compelled E. to flee the country. King Henry was released from the Tower, where he had been a prisoner for six years, and once more invested with royal authority. But in the spring of 1471, E. landed at the Humber, proceeded swiftly to London, seized the person of Henry, and was again hailed king by the inhabitants. Warwick now gathered an army, and hurried to encounter him. The two met at Barnet, where Warwick was defeated and slain, April, 1471. In the course of the next month, E. routed the Lancastrians at Tewkesbury, capturing both queen Margaret and her son, prince Edward. The latter was murdered the day after the battle; the queen herself, after an imprisonment of four years, was ransomed by the French monarch. E. died 9th April, 1483, the later years of his reign presenting few political incidents of any moment. E. was an able commander, as his numerous victories show, but he was dissolute in the extreme. It was during his reign that printing was introduced into England, as also silk manufactures. In law, few notable changes occurred, but the practice of indirect pleading dates from this period, which is also illustrated with the names of distinguished legists, such as Littleton and Fortescue.

EDWARD V., son of the preceding, was b. 4th Nov., 1470. The story of his life is brief and tragic. At the death of his father, he was living at Ludlow, in Shropshire, a boy of thirteen. When the news reached Ludlow, earl Rivers, his uncle by the mother's side, set out with him for London. Richard duke of Gloucester, however, contrived to obtain possession of his person at Northampton, and brought him to the capital himself, in the beginning of May, 1483. Towards the end of the same month, Richard was appointed protector of the kingdom. About the middle of June, the young duke of York, brother of Edward V., also fell into his hands. The two hapless boys were then removed to the Tower, and were never more heard of. The general, and in all probability the correct opinion is, that they were murdered by commad of Gloucester himself. All attempts to whitewash "the bloody and devouring chief" have signally failed.

EDWARD VI., son of Henry VIII. by his wife Jane Seymour, was b. at Hampton Court, 12th Oct., 1537. The events which happened during his brief reign were of great importance, but they were of course brought about by others, E. being too young (he was not sixteen when he died) to exercise any personal influence on the statesmen or the tendencies of his age. On the death of Henry in 1547, Edward Seymour, earl of Hertford, became protector of the kingdom. He was attached to the principles of the reformation, and during his rule, great strides were made towards the establishment of Protestantism in England. The images were removed from the churches; refractory Roman Catholic bishops were imprisoned; the laity were allowed the cup at the ceremony of the Lord's supper; all ecclesiastical processes were ordered to run in the king's name; Henry's famous six articles (known as the Bloody Statute) were repealed; a new service-book, compiled by Cranmer and Ridley, assisted by eleven other divines, was drawn up, and ordered to be used, and is known as the *First Prayer-Book of Edward VI.* (see COMMON PRAYER BOOK); and the celibacy of the clergy ceased to be obligatory. In war, Seymour showed himself to be a brave general. During the first year of his protectorate, he invaded Scotland, on account of the refusal of the Scottish government to fulfill the contract into which it had entered with Henry VIII., by which it was agreed that Mary queen of Scots should marry Edward. The battle of Pinkie followed, on the 10th Sept., 1547, in which the Scots were completely beaten; and Seymour, now duke of Somerset, might have inflicted most serious damage on the whole country if his presence had not been required at home. He returned to find that his brother, lord Seymour, had been caballing against him. Somerset had him arrested, tried, and condemned for treason, and on the 20th of Mar., 1549, he was beheaded on Tower Hill. In the summer of the same year the protector quelled an insurrection of the populace headed by one Kett, a tanner; but in the course of a few months, a more dangerous adversary appeared in the person of John Dudley, earl of Warwick, whose party, by dint of insinuations against Somerset, excited the nation against him, and at last compelled the king to sign his deposition. On the 14th of Oct., Somerset was placed in the Tower; and on the 1st of Dec., 1551, he was tried before the house of lords for treason, condemned, and executed, 22d of Jan., 1552. The people regretted, with good reason, his death, for Dudley was both a worse and a weaker man than himself. Before Somerset's execution, Dudley had been created duke of Northumberland. He was himself (judging from his dying declaration) a Catholic, but he certainly took no means to re-establish the old religion. His great aim was to secure the succession to the throne of England for his family. With this view, he married his son, lord Guildford Dudley, to lady Jane Grey, daughter of the duchess of Suffolk, to whom, by the will of Henry VIII., fell the crown, in default of issue by Edward, Mary, or Elizabeth. Northum-

berland now worked upon the weak and dying Edward to exclude Mary and Elizabeth, and nominate lady Jane Grey as his successor. E. at last consented, and a document settling the succession on this lady was drawn up in June, 1552. The king lived only a few weeks after, dying on the 6th of July. Subsequent events entirely frustrated Northumberland's design. King E., during his short reign, founded a great number of grammar-schools, which still exist, and are known as *king Edward's schools.*

EDWARDES, Sir HERBERT BENJAMIN, 1819–68; b. England; early in army service as a cadet in India; in 1841, ensign of the 1st Bengal fusiliers, with which regiment he remained five years, improving himself especially in the native languages. In the Sikh war he was aid to viscount Gough, the English commander-in-chief. After the war he continued in responsible positions in the civil service, but was soon again on military duty, doing service so brave and important as to receive the thanks of parliament. He was commissioner of the Peshawur frontier at the time of the Sepoy rebellion, and raised and sent a large force to aid in the siege of Delhi. For his many services he received the successive decorations of C.B., K.C.B., and K.C. of the star of India. He received the degree of LL.D. from the university of Cambridge. He published *A Year on the Punjab Frontier in* 1848–49.

EDWARDS, a co. in s.e. Illinois, bounded on the s.e. by the Little Wabash, reached by a branch of the Louisville, New Albany and St. Louis railroad; 200 sq.m.; pop. '70, 7,565. The surface is forest and prairie, producing wheat, corn, wool, tobacco, etc. Co. seat, Albion.

EDWARDS, a co. in s.w. Texas, in a rough region; 1225 sq.m.; entirely unsettled in 1870.

EDWARDS, BELA BATES, D.D., 1802–52; b. Mass.; graduated at Amherst, and studied theology at Andover theological seminary. In 1828, he was secretary of the American education society, and from 1828 to 1842, the editor of the organ of that society, the *American Quarterly Register.* In 1833, he started the *American Quarterly Observer,* which was soon united with the *Biblical Repository,* Dr. Edwards continuing as editor. From 1844 to 1852, he was editor of the *Bibliotheca Sacra.* In 1837, he was professor of Hebrew at Andover, and in 1848, of biblical literature. Among his works are the *Eclectic Reader; Biographies of Self-taught Men;* the *Missionary Gazetteer;* sermons, addresses, etc. In 1853, selections from his sermons, etc., were published with a memoir by prof. Edwards A. Park, who had long been his intimate friend and associate in literary and theological labors. In Edwards there was a rare combination of exact scholarship and critical thought, with a wide range of sympathy, both intellectual and moral, while his character was lovely with the modesty and gentleness which belong to the highest strength. These characteristics showed themselves in his English style, which was singularly pure, elegant, and vigorous.

EDWARDS, BRYAN, 1743–1800; b. England; when a boy he went to Jamaica, where the generosity of his uncle enabled him to finish his education. When his uncle died he inherited his vast estate. He was a member of the colonial assembly, but is best known by his *History, Civil and Commercial, of the British Colonies in the West Indies.* He also published a *History of San Domingo,* just after the great massacre. In 1796, he returned to England, and became a member of parliament, holding the place until his death.

EDWARDS, GEORGE, 1693–1773; b. England. He traveled in northern Europe studying natural history, and published *History of Birds,* in 4 vols., at intervals of several years; and *Gleanings of Natural History.* He was a member of nearly all the leading scientific societies.

EDWARDS, HENRI MILNE. See MILNE-EDWARDS, HENRI.

EDWARDS, JONATHAN, a celebrated American divine and metaphysician, was b. at Windsor, in the state of Conn., 5th Oct., 1703, entered Yale college in 1716, took his degree of B.A. in the following year, and in 1722 was licensed to preach the gospel. Towards the close of 1723, he was appointed tutor of Yale college, an office which he filled with distinguished success. In 1726, he accepted an invitation to become colleague to his maternal grandfather, Mr. Stoddard, in a church at Northampton, and was ordained in Feb., 1727. Here he labored with intense zeal for more than 23 years, at the end of which period he was dismissed by his congregation. The immediate cause of the rupture between him and his hearers, was his insisting that no "unconverted" persons should be allowed to approach the Lord's table; but some years before, he had alienated the regards of a large number of the influential members of the church by denouncing the reading and circulation of certain books which were immoral and injurious, and by attempting to make a public example of the offenders. E. was a powerful and impressive preacher, somber and even gloomy in his religious opinions and sentiments, but earnest, unaffected, and nobly conscientious. During the famous "revival" of 1740–41, he was much sought after as a preacher, and is in fact often regarded as the originator of that movement. Certain it is that as early as 1734, a local manifestation of religious enthusiasm had taken place in his own parish, of which he published an account, entitled *A Faithful Narrative of the Surprising Work of God, in the Conversion of many Hundred Souls in Northampton.* The quarrel between E. and his congregation shows, however, that the "revival" had not exercised any very strong

influence on the community in general, since only a few years elapsed between the ecstasies of devotion and the circulation of obscenity. After his dismissal in 1750, E. became a missionary among the Indians of Massachusetts. While residing at Stockbridge in that state, he composed his famous treatises on the *Freedom of the Will* and *Original Sin*. In 1757, he was chosen president of Princeton college, New Jersey, whither he proceeded in Jan., 1758, but was cut off by small-pox on the 22d of Mar. in the same year.—E. will always be considered a master in dogmatic theology. Calvinism had probably never so powerful a defender. According to the late Robert Hall, "he ranks with the brightest luminaries of the Christian church, not excluding any country or any age since the apostolic." His great characteristics are depth and comprehensiveness of argument; and were it not that the age for such discussions as E. loved is gone by, few writings would be more worthy of patient study than those of this illustrious divine. Besides the works already mentioned, E. wrote a *Treatise concerning Religious Affections;* the *History of Redemption;* a *Dissertation concerning the End for which God created the World;* and a *Dissertation concerning the True Nature of Christian Virtue*. The last three were posthumously published. A complete edition of E.'s works was published by Dr. Timothy Dwight in 10 vols. (1809), and another at London in 1817. A third was published in 1840, containing an essay by Henry Rogers, and a memoir by Sereno E. Dwight.—JONATHAN EDWARDS, D.D. (born 1745, died 1801), the son of the preceding, was a person of similar character to his father, and, curiously enough, experienced similar vicissitudes of fortune. Both were tutors in the seminaries in which they were educated; were dismissed on account of their religious opinions; were settled again in retired situations; were elected to the presidentship of a college; and in a short time, after they were inaugurated, died at nearly the same age. The younger Edwards was also a writer of sermons and theological treatises.

EDWARDS, JONATHAN (*ante*), in all accounts given concerning him, is sufficiently celebrated as a severe reasoner and profound writer on metaphysical themes. But they who would understand the influence which he has already exerted, and estimate rightly that which he will continue to exert, must not neglect other points of his nature and work. 1. His humility, modesty, and serenity of spirit endeared him to his friends and made him appear amiable to all who conversed with him. As a Christian he was an example of rational virtue and religion. In him men saw a rare assemblage of spiritual graces united with the richest mental gifts. He read all useful books that he could procure, especially those on theological subjects, examining both sides of a question, studying views which to him were erroneous, and investigating the arguments of extreme infidelity. But the Bible he studied more than all other books. His intimate acquaintance with it is conspicuous in all his writings. Few men were less under the bias of education or of bigotry. He exerted all his powers to find out truth, searching for it as for hid treasure. Every valuable thought he pursued at once as far as he then could. He read pen in hand, not so much to take notes of other men's thoughts as to secure his own. His scholarship was remarkable for the day in which he lived and the opportunities which he enjoyed. Born in an obscure village of a new and thinly settled colony, with the forests around him, and separated by 3,000 m. of ocean from the seats of art, refinement, and knowledge; educated at a college (only three years older than himself) that offered advantages less than academies now supply, he passed all the rest of his years amidst the cares of a laborious profession, on the very frontiers (and some of those years in the heart) of savage life. Yet, with all these hindrances, he was a proficient in classic and Hebrew literature, physics, mathematics, history, chronology, mental philosophy, and ethics. His greatest work was written in four and a half months, during which he carried on the correspondence of the mission and preached, each Sabbath, two sermons in English, and two by interpreters to two Indian congregations, besides catechising the children of both tribes. His neglect of style as a writer is to be regretted. His works were printed very much as first written. Yet a marked improvement was effected in his later years. The style of the *Inquiry Concerning the Freedom of the Will* (written, as has just been said, in so short a time) is considered by competent judges to be as correct as that of most metaphysical treatises. 2. In the early part of his life he acquired a very high character as a minister and preacher. Most of his hearers felt and acknowledged his power. Long before the publication of his writings, his fame as a preacher had spread through the colonies and into Great Britain. To eloquence, as many use the word, he had indeed no claim. He exhibited no studied varieties of voice, no strong emphasis, no graceful gesticulation, no attempt at elegance of style or beauty of illustration. But if eloquence be the power of presenting important truth to an audience with overwhelming weight of argument, and with the whole soul of the speaker thrown into every part of the conception and of the delivery, so that the attention of all is riveted until the end, and impressions are made which cannot be effaced, then Jonathan Edwards has been justly pronounced one of the most eloquent preachers of his own or of any age. His solemn consciousness of the presence of God controlled his preparations, was manifest in his services, and had an irresistible effect on his congregations. His knowledge of the human heart, springing from knowledge of the word of God, skill in mental philosophy, and his own personal experience,

enabled him to speak to the consciousness of his hearers. His theological learning was so complete, and his general information so extensive, that he could impart variety and richness of thought to his sermons, and bring illustrations to bear on every point. From first to last his aim was simply the salvation of his hearers and the glory of God. In the introduction to his sermon he explained the passage from which he was to preach, and with great skill presented its whole drift in all its bearings. In the body of the sermon he did not attempt an elaborate proof of his doctrine, but rather placed it before his hearers as a fact, and painted it to their imagination. He laid out his strength in the application, speaking to the consciences of his hearers, applying to different characters the important ideas of the sermon, and closing with a solemn and earnest appeal to every feeling and principle of human nature. He counseled, exhorted, warned, expostulated, as if he was determined not to stop without convincing and persuading every man. 3. While his visits among his flock were, in a great degree, restricted to the sick and afflicted, he was eminently faithful and successful in other departments of pastoral work, especially in extraordinary labors during "revivals" which sprang up under his ministry, and in conversing with those who sought spiritual counsel. His study was at times thronged with persons who came to lay open to him their minds and hearts. 4. His theological treatises, especially, have made him extensively known, and are the foundation on which his highest reputation will ultimately rest. (1) In these he is distinguished for scriptural views of divine truth, adducing many passages in illustration and proof, examining them critically, arranging them carefully, and drawing conclusions from them with fidelity and skill. He seldom introduces any hypothesis of his own, and betrays little confidence in his own reason unless it is supported by the oracles of God. (2) He presents no partial or contracted views; all are simple, great, and sublime. His mind was too expanded to regard the minor distinctions of denominations and sects. He belonged to no church but the church of Christ, contended for nothing but the truth of God, and aimed supremely at holiness and salvation. His labors coincide so completely with those which the gospel prescribes, that no denomination can appropriate him exclusively to itself. His originality in argument is striking and continued. He never walks in a beaten path. His positions, arguments, and conclusions are his own; and he did much to render theology a *new* science. (3) In controversy he maintained an excellent spirit. His integrity and fairness were conspicuous. The idea of employing sophistry in his argument seems never to have occurred to him as a possible thing. He was kind and sincere; fair in stating the real point in debate; and candid towards his opponents. He carefully avoided personalities and the imputation of unworthy motives to those from whom he was compelled to differ. These excellences as a disputant appear the more remarkable when the circumstances in which he wrote, and the topics which he handled, are considered. The treatise on the affections was written in the heat of a violent controversy which divided and agitated the whole country. In his works on the will, original sin, and justification, he dealt with subjects which had aroused bitter opposition, and replied to persons who had boasted of their victories in vain-glorious and irritating terms. His book on qualifications for communion was composed in the midst of a furious parochial storm, which did not ruffle his temper, although it drove him from his parish and home. (4) While his manner was courteous and his temper undisturbed, his arguments were, for the most part, unanswerable. They derived their strength from the conclusiveness of his reasoning, the employment of different trains of proof, all converging to one result, the anticipation of objections which might be taken to his view, and the skill with which he brought the *reductio ad absurdum* to his aid. The most metaphysical of his writings—*On the Freedom of the Will*—has been described by high authority as "a book which never has been, and never will be, answered." His most practical treatise—on *The Qualifications for Communion*—being an attack on a favorite scheme of lax religionists, aroused indignation all over the country. Yet after a disastrous controversy it has so changed the opinions and practice of the New England ministers and churches, that a mode of admission to church-membership or to a *quasi* membership, then almost universal, is now disused. (5) In all his writings, even the most metaphysical, he aimed at the most important practical results. In them all his immediate success was great, and by them his influence on doctrine and piety has been extended through Christian schools of theology, pulpits, churches and homes. Some of the themes on which he has given light are the following: God's end in creating this material and spiritual universe; the nature of his government over intelligent minds, and how it is consistent with their freedom; the nature of the virtue which they must possess in order to secure his approbation; the source, extent, and evidences of human depravity; the series of events by which redemption is effected; the qualifications for the church to which the redeemed belong; the grounds on which they are justified; the nature and evidences of the religion imparted to them by the spirit of grace; the distinguishing marks and effects of revivals of religion produced by the effusion of divine influence on men; the inducements to united and special prayer that such effusions may be abundantly enjoyed by the church of God. Why—it has often been asked—did such a man die at the age of 54 years, in the fullness of his powers, and just when he had been called from the wilderness to fill one of the highest stations in the land?

EDWARDS, PIERREPONT, 1750–1826; son of Jonathan, the theologian. He served in the revolutionary army; practiced law; and was a member of congress in 1787. He was U. S. district judge for Connecticut at the time of his death.

EDWARDS, TRYON, D.D., b. Conn., 1809; great-grandson of Jonathan, the theologian; graduated at Yale, studied theology at Princeton, and law in New York; settled in the ministry at Rochester, N. Y., in 1834, and afterwards at New London, Conn. Among his publications are *Christianity a Philosophy of Principles; Self-Cultivation;* etc. He has edited *Charity and its Fruits; Select Poetry for Children and Youth*; *Jewels for the Household; The World's Laconics; Wonders of the World;* and many issues of the *Family Christian Almanac.*

EDWARDS, WILLIAM, 1770–1851; b. N. J.; grandson of Jonathan. He introduced valuable improvement in the manufacture of leather, whereby tanning was accomplished in a quarter of the usual time. To be in proximity to abundance of hemlock bark, he set up a model tannery in the Catskill mountain region. His many improvements greatly advanced the production of leather in this country.

EDWIN, an English Saxon prince, was the son of Ella, king of Northumbria, who died about 589. He succeeded to the throne at the age of three years, but a neighboring potentate, Ethelfrith, invaded and conquered his territories, whereupon the infant E. was carried into North Wales, and was there educated. When he grew up to man's estate, Ethelfrith, fearing that his power would not be secure so long as E. lived, forced him from his asylum, and for many years he wandered about a disguised fugitive. Reaching East Anglia, he claimed the protection of king Redwald, which was readily granted. While residing there, Ethelfrith sent messengers to Redwald, requiring him to deliver E. into his hands, and threatening war in the event of a refusal. Redwald promised to accede to the request. A friend made known the resolve to the prince, and counseled flight; to this E. would not consent, but sat down without the palace, brooding over his misfortunes. While sitting there, Bede states that an unknown person approached him, and promised release from all his sufferings, if he would listen to what should be afterwards taught him. The apparition then placed its hand upon his head, and bidding him remember the interview and the sign, disappeared.

Redwald's queen pleaded the cause of E., and he finally determined to protect him. Raising an army, Redwald surprised Ethelfrith on the Idel, in Nottinghamshire, and defeated and slew him in 617. When E. regained his kingdom, he wooed Edelberga, daughter of Ethelbert of Kent. Her brother, who was a Christian, objected to her alliance with an idolater; but E. promised that he would not interfere with her religious belief. The princess became his wife; and Paulinus, who had been sent by Gregory to assist Augustine in his mission, accompanied her as her bishop.

About this time, E.'s life was attempted by an assassin, sent by the king of Wessex. He escaped with a slight wound, and on the same night the queen was delivered of a daughter. The king thanked his idols for the birth, but Paulinus directed his thankfulness to the Christian Saviour. The king promised to accept the new faith, if Heaven would grant him victory over the king of Wessex. His child and 11 of his household then received the rite of baptism. Raising an army, he defeated his foe, but delayed to fulfill his promise. Paulinus, having heard of the apparition which appeared to him while residing at the court of Redwald, one day entered the apartment in which E. sat, and placing his hand upon his head, asked him if he remembered the sign. The king was visibly affected, and at once assembled his witenagemôte to deliberate on the matter of the new religion. Coifi, the high-priest, spoke first, and intimated his willingness to desert the idols, and embrace the Christian faith. A thane next rose and pronounced the beautiful speech which has been versified by so many poets, but which is most effective in the simple serious Saxon of the chroniclers. Coifi then headed the people in destroying the idol temple.

E. and the nobility of his kingdom were baptized in the eleventh year of his reign. Thereafter, he became the most powerful prince in England. He subdued a part of Wales, and his power extended northward to the Lothians. In 634, he fell in battle at Hatfield Chase, in Yorkshire; and in that disastrous fight, one of his children, and the greater portion of his army, perished. The history of this prince has been made the subject of a beautiful poem (*Edwin of Deira,* 1861) by Alexander Smith.

EDWY, EADWIG, or EDWIN (THE FAIR), about 938–58; king of the Anglo-Saxons; eldest son of Edmund I. He succeeded his uncle Eldred in 955. Little is known of his short reign except that he was at enmity with Dunstan, who bitterly opposed his marrying Elgiva. Dunstan was banished from the kingdom, but not long afterwards was restored by the Mercians, who had revolted from Edwy, and proclaimed Edgar king.

EECKHOUT, GERBRAND VAN DEN, 1621–74; a painter, b. in Amsterdam; a pupil of Rembrandt, whose style he successfully imitated. As a portrait painter he had a peculiarly superior talent for expressing character. Among his best compositions are "Christ in the Temple," and "Haman and Mordecai."

EECLOO, a t. of Belgium, in the province of East Flanders, stands on the high-road between Ghent and Bruges, and is 12 m. n.w. from the former. It is clean and well built; and has manufactures of woolens, cottons, hats, tobacco, chocolate, soap, etc.;

also breweries, distilleries, vinegar-works, salt-refineries, dye-works, oil-mills, and a thriving trade in linen, cattle, and timber, as well as in grain, for which it has a large weekly market. Pop. '73, 9,564.

EEL, a name popularly given to all serpent-shaped or worm-shaped fishes, and sometimes extended to other animals of similar form, but otherwise extremely different, as the *eels* in paste, in vinegar, etc. The fishes to which this name is most commonly applied are *malacopterous* fishes destitute of ventral fins, and having the body covered by a soft thick slimy skin, the scales very minute, and often almost invisible, or entirely wanting. Most of them were included in the Linnæan genus *muræna*, and now constitute the family *muræniдæ*, divided by some naturalists into the families *synbranchidæ*, *muræniдæ*, *anguillidæ*, *congeridæ*, and *ophisuridæ*. All these have the skeleton destitute of ribs, and the fin-rays not jointed; whilst the *gymnotidæ*, including the electric eels (see GYMNOTUS), have ribs encompassing the belly, and the fin-rays jointed or branched. In all the eels, the gill-orifices are very small, and are situated far back, so that there is a long passage from the gill-chamber outwards; and hence, the gills not soon becoming dry, these fishes can remain out of water for a considerable time without injury, and some of them occasionally leave it of their own accord. The smallness of the gill-opening is also regarded as probably indicative of feebleness of respiration; and this, as in reptiles, is connected with extreme tenacity of life.—The *synbranchidæ* have the gill-passages so united under a common integument, as to present externally only a single orifice. They are almost destitute of fins. The species are few, and found only in tropical and sub-tropical seas.—The *muræniдæ* are also generally destitute of fins, or nearly so; they are all destitute of scales. They are all marine.—The *anguillidæ*, on the contrary, are fresh-water fishes, although some of them occasionally visit the sea. They have pretty large pectoral fins, anal and dorsal fins extending to and encompassing the tip of the tail, and numerous longish scales imbedded in groups in the skin, so as to resemble lattice-work. To these the congers (q.v.), although marine, are very nearly allied. The *ophisuridæ*, or snake-eels (q.v.), of the Mediterranean and other seas, are more widely different, and are easily distinguished by the tail ending in a conical finless point.

Until recently, all the British fresh-water eels were confounded together as of one species (*anguilla vulgaris*): Mr. Yarrell was the first accurately to distinguish them, and to show that there are at least three, if not four species, differing considerably in form, and in anatomical characters, as the number and form of the vertebræ, etc. Two of these seem to be very generally diffused, the SHARP-NOSED E. (*A. acutirostris* or *A. vulgaris*) and the BROAD-NOSED E. (*A. latirostris*). The difference in the form of the snout, which these names indicate, is very marked and obvious, and the general form of the sharp-nosed E. is also more slender.—The SNIG E. (*A. mediorostris*), found in some of the English rivers, is intermediate in the form of its snout, and is considered superior to the other kinds for the table. Its cervical vertebræ are destitute of the spinous processes which are found in both the other species. It is comparatively small. The sharp-nosed E. seems to attain the greatest size, sometimes almost 30 lbs. weight. It migrates on the approach of winter to the warmer brackish water of estuaries, often entering water which is perfectly salt; or if migration is impossible, it buries itself in mud. Eels are taken in great numbers during winter by means of *eel-spears*, or forks with several prongs, plunged into the mud. Sometimes they are digged out of the mud of river-banks, where large numbers are found congregated together. The eels which descend to estuaries or to the sea deposit their spawn there, and countless multitudes of young eels ascend rivers in spring, The passage of the young eels is called on the Thames the *eel-fare*, from a Saxon word signifying to pass or travel. So strong is the instinct which impels them, that they surmount obstacles apparently far more than sufficient to arrest their progress; they have been seen to ascend the large posts of flood-gates, "those which die, stick to the posts; others, which get a little higher, meet with the same fate, until at last a sufficient layer of them is formed to enable the rest to overcome the difficulty of the passage." Young eels have also sometimes been met with in large numbers performing migrations on land among moist grass, generally in the evening or during the night; but the purpose of these migrations is not very well understood, nor are they known to take place with regularity.—Those eels which cannot migrate to the sea, breed in inland rivers and lakes.

Eels are very averse to cold, and to this is ascribed their winter descent to brackish water, or hiding of themselves in mud. The number of known species is large, but they all belong to the temperate and warmer regions of the globe. In these, also, the marine fishes to which the name E. is sometimes extended, chiefly abound.

There is a prejudice in some countries—particularly in Scotland—against eating eels, on account of their serpent-like appearance; but generally, as in England, they are highly esteemed. The London market is very largely supplied with eels from Holland; they are sent over alive in welled vessels.

There are various means beside those already noticed employed for the capture of the eel. Weirs and stages are erected across rivers, and baskets, or *bucks*, as they are termed, fixed in them for the taking of the eels during their migrations. These baskets are of large size, and shaped like a huge Chinese jar, in the mouth of which is fitted a

sort of funnel-shaped mouse-trap entrance, composed of flexible withy rods coming inwards to a point, and through which the eels can easily force their way; but when they turn about to find the entrance again, it is closed against them. When the eels are running, as it is termed—that is, during their migrations—many hundredweights are often taken in these basket-traps in a single night. *Eel-pots* are also used for their capture. These are of a similar nature to the bucks, but are smaller and more slender. They are sunk, by means of bricks tied to them, in the most likely runs or narrow spaces between weeds, or close to banks, and through which eels are likely to run. After a thunder-storm, eels always run well, as it disturbs them greatly. Eels are also caught by means of night-lines. These are long lines with heavy weights at each end, and in the middle if necessary, with hooks tied on every yard. These hooks are baited with pieces of dead fish, minnows, or worms. The line is sunk, and laid across stream—or, if fishing for conger-eels, in the sea—with, if it be thought necessary, a small buoy at one end, to recover the line by. These eel-lines should be hauled as early in the morning as possible, or the best eels will be found to have worked themselves off, leaving a mass of knots and slime behind them, to show where they have been. *Snigging* is a favorite amusement with some anglers. A rod or a long stick is provided, bent round at the slender end like the top of a very well used fishing-rod; on the point is fixed a single ring; through this ring is passed a piece of string; one end of this is held in the fisherman's hand. To the other end, on some fine but strong cord, is fastened a stout darning-needle, tied to the cord by the middle. The needle is then baited, or thrust lengthwise into a large lob-worm, until the fine cord alone comes out at the head of the worm. The worm is then drawn up to the ring of the rod. The fisherman then seeks for some hole in which he thinks an E. may be, and applying the point of the rod, pushes the worm into it. As soon as the fisherman believes an E. has swallowed the bait, he gives a slight pull to the string; and the needle, which has gone down the E.'s throat inside the worm perfectly straight, being tied by the middle, turns crosswise in the E.'s throat or stomach, and hooks him. *Clod-fishing* is thus practiced: a quantity of lob-worms are strung by means of a needle on to some stout worsted until a considerable bunch of them is obtained; this is tied to the end of a cord, which is again tied to a stout pole. When the eels are on the move, the fisherman takes his station with a pail half full of water within reach; he then drops his clod into the water, and allows it to sink to the bottom. As soon as he feels an E. tugging at it, he steadily and quickly, but without jerk, raises the bait from the water. The E. frequently has its teeth so entangled in the worsted as to be unable to let go, and thus is lifted from the water. The bait is held over the pail, a shake or two dislodges the E., and the clod is then dropped into the water again, to fish for more. Sometimes two or even three eels come up at once, and a great number are often taken thus.

EE'LEE, or ILI, a river of central Asia, rising in China and running w. about 600 m. to lake Balkash. The valley of the Eelee is the usual route between Russia and China.

EE'LEE, or GOOLDJA, a city in the extreme w. of China, in central Asia, on the river of the same name, 43° 46′ n., and 82° 30′ e.; pop. said to be 80,000. It is an important commercial center, and was formerly the place to which Chinese criminals were banished.

EEL-POUT, a name given in some parts of England to the burbot, and on some parts of the Scottish coast to the viviparous blenny.

EELS in paste, vinegar, etc., are animalcules (*infusoria*) of the family *vibrionidæ*. When at rest, they appear like very minute hairs, or bits of very fine thread. Some of them wind themselves about in a spiral form when they move. The species are numerous, and they occur in almost all vegetable substances beginning to corrupt and undergo decay, which they hasten. They are found also in decaying animal matter, and have recently been detected in diseased animal tissues; but the species found in such situations have not the elongated form which has given the name E. to those inhabiting paste a few days old, stale vinegar, etc., or occurring in diseased parts of living vegetables. Whether or not the origination of disease is to be ascribed to their presence in animal tissues, is not yet well ascertained; but in living vegetables this appears to be certainly the case, particularly in the disease of wheat called ear-cockles (q.v.).

EFAT. See SHOA, ABYSSINIA.

EFFARE, or EFFRAYÉ (Fr.), in heraldry, signifies that the animal to which it refers is to be represented as rearing on its hind-legs, as if it were frightened or enraged.

EFFECT. The general impression produced on the mind by the first sight of a picture or other work of art, or the impression which it produces when seen from so great a distance as to render the details invisible. The term has reference both to design and coloring, both of which, if correctly indicated, may be judged of with perfect confidence before either has been completed in detail. Bold sketches of their works are generally made by careful artists beforehand, for the purpose of adjusting the composition and coloring so as to produce the desired effect.

EFFENDI, a title of honor among the Turks, bestowed upon civil dignitaries and persons of various ranks, in contradistinction to the title of aga, borne by courtiers and

military men. The word is equivalent to the English sir, or the French monsieur, and is frequently added to the name of an office. Thus, the sultan's first physician is termed *Hakim-effendi;* the priest in the seraglio, *Imam-effendi;* and the minister of foreign affairs was formerly called *Reis-effendi.*

EFFERVESCING DRAUGHTS. See AËRATED WATERS.

EFFIGY (Lat. *effigies*), a likeness or representation either of the whole figure or of the head and face, as on a coin. See BRASS, MONUMENTAL. It is scarcely an artistic word.

EFFINGHAM, a co. in e. Georgia, separated from South Carolina by the Savannah river, and bounded w. by the Ogeechee; crossed by the Georgia Central railroad; 480 sq.m.; pop. '70, 4,214—1704 colored. The surface is level, and mostly covered with forests; soil sand and poor; productions, corn, cotton, and rice. Co. seat, Springfield.

EFFINGHAM, a co. in s.e. Illinois, on Little Wabash river; intersected by the Illinois Central, the St. Louis, Vandalia, and Terre Haute, and the Ohio and Mississippi railroads; 500 sq.m.; pop. '70, 15,563. The surface is mostly prairie and the soil fertile, producing corn, wheat, etc. Copper, iron, coal, and lead are found. Co. seat, Effingham.

EFFLORESCENCE is the term applied to the appearance of a white incrustation on the walls of buildings, or when a salt loses its water of crystallization, and presents a white powdery appearance on the surface. Common washing-soda exposed to the air affords a good illustration of this phenomenon.

EFFRAYÉ. See EFFARÉ.

EFT, a term of Anglo-Saxon origin, applied both to lizards and newts, which—notwithstanding the important differences between them—were until recently confounded even by naturalists. The Scotch word *ask* seems to be the exact equivalent of the English *eft.* In works of natural history, the term eft is now used as synonymous with newt (q.v.).

ÉGALITÉ, PHILIPPE. See ORLÉANS, LOUIS PHILIPPE JOSEPH, *ante.*

EGBERT, the most celebrated of the Anglo-Saxon kings before Alfred, was the son of Alckmund, who is said to have reigned in Kent, and was a descendant of the house of Cerdic. In 787, on the death of Cynewulf, king of Wessex, E. laid claim to the throne, but had to give way to another claimant, Brihtric, who was the more powerful of the two. E. was compelled to flee, and took refuge at the court of Charlemagne. Here he remained for 13 years, until, in 800, on the death of Brihtric, he was summoned to England to fill the throne of Wessex. England was at this time divided into three great sovereignties: Northumbria, extending over what were occasionally the separate kingdoms of Deira and Bernicia; Mercia, which had now subjugated the petty powers of Kent, Essex, and East Anglia; and Wessex, which had absorbed Sussex. For the first nine years of his reign, E. drew no sword. His mild government completed the attachment of his subjects, and the peace which he maintained fostered his strength. In 809, however, he marched against the Britons of the west, and after fighting five years in Cornwall and Devon, he succeeded in subduing the wild tribes to at least a temporary subjection. In 823, the most important event in his career took place. At that time a dispute had arisen between the East Angles and their Mercian conquerors, and the former sent ambassadors to E. imploring aid and protection. E. joined the East Angles with an army which, according to the old chroniclers, had a peculiarly fighting appearance, being "lean, meager, pale, and long-breathed." The encounter between the Mercians and the East Angles with their ally took place at Ellandûn (the modern Wilton, according to some), where a furious battle was fought, in which the Mercians were defeated with great slaughter. By this battle the power of Mercia was broken, and Essex and Kent, formerly Mercian provinces, became incorporated with Wessex. For four years after the great battle of Ellandûn, Mercia remained the seat of discontent and strife, and E., in 827, taking advantage of his opportunity, led thither an invading force, and reduced the country to a state of vassalage. Turning next his arms against Northumbria, he compelled that sovereignty also to acknowledge his supremacy (827-828). He afterwards penetrated into Wales, where, in like manner, success attended his arms.

E., now virtually king of England, though both he and his successors until the time of Alfred were in the habit of designating themselves only kings of Wessex, found it necessary, after a few years' comparatively peaceful rule, to direct his attention to a new and foreign enemy. The Danes, who had been making frequent descents upon the island since 832, and who in that year had defeated the forces of E., reappeared in 835 on the coast of Cornwall, where they were joined by numbers of the Cornish Britons. E., however, at the head of his West Saxons, met them at Hengestes-dûn (Hengstone), and in a great battle completely overthrew them. In the following year, he died, after a reign of 37 years.—In E., ambition and prudence, bravery, talent, and courtesy were blended in such a manner as to form a monarch not unworthy to be the first king of England.

EGEDE', HANS, was b. in Norland, in Norway, Jan. 31, 1681, studied in Copenhagen, and was appointed to the church of Vaagen in Norway in 1707. Having determined to proceed to Greenland to convert the natives, he resigned his *cure* at the end

of ten years; and, after devoting himself with assiduity to the study of the language, embarked for Greenland, with his wife and sons, in 1721. He remained 15 years in Greenland, during which time he labored zealously among the people, and by his preaching and teaching secured a permanent footing there for the Christian mission, which owed its origin to him. On his return to Copenhagen, he employed himself in instructing missionaries in the dialects of Greenland; and in 1740, he was made a bishop. He died in 1758. He has described the course and success of his labors in *Det gamle Grönland's nye Perlustration* (Copenh. 1729 and 1741). He was ably seconded in his labors by his wife and his sons, Povel and Niels.—Povel Egede, who was his father's successor in Greenland, and was also a bishop, translated the gospels and several devotional works into the Greenland language, and compiled a grammar and dictionary for the use of the Greenland mission; the latter appeared in 1750 under the title *Dictionarium Grönlandico-danico-latinum*.

EG'ER, a t. and river of Austria, in the province of Bohemia.—1. The town E. stands on a rock on the right bank of the stream of the same name, is 90 m. w. of Prague, and near the Bohemian frontier. Formerly, it was a border fortress of some importance; its walls, however, have been almost entirely pulled down, and its fosses filled up with rubbish. Among the conspicuous edifices of E. are its churches, of which there are four —one of them, the deanery church, very handsome; the market-place, within which is the large town-hall; two monasteries, a Dominican and a Franciscan; and the barracks. East of the market-place is the house of the burgomaster, in which Wallenstein was assassinated in 1634. The ruins of the imperial burg or citadel, formerly the residence of kings and emperors, is situated in an angle of the fortifications above the river. From the midst of these ruins rises a singular square black tower, constructed of masses of volcanic tufa. The double chapel, consisting of two stories, the upper supported by graceful marble pillars, is a fine specimen of Gothic architecture. An avenue, nearly three m. long, leads from E. to Franzenbrunn (q.v.). E. has manufactures of broadcloth, kerseymeres, cottons, chintz, leather, soap, etc. Its industry and commerce have greatly increased since it became a point of junction of five railways. Pop. '69, 13,463. —2. The river E. rises 12 m. n.w. of the t. of E., flows first s.e. to E., then advances in a general n.e. direction, passing Elbogen, Saaz, Birdin, and Theresienstadt, near which town it joins the Elbe, after a course of about 120 miles. Its current is rapid, and no part of its course is navigable.

EGE'RIA was the name of the Nymph or Camena, from whom, according to the legend, king Numa received the ritual of public worship which he established in Rome. The grove where Numa met the goddess to receive her instructions was dedicated by him to the Camenæ. Roman legends speak of two groves dedicated to E.—one near Aricia, the other before the Porta Capena at Rome, where the grotto of E. is still shown.

EGERTON, Francis. See Bridgewater, *ante*.

EGG, *Ovum*. In a great majority of the different kinds of animals, reproduction takes place by means of eggs; in other words, the animals are *oviparous*. It is only in the *mammalia* that we find animals truly viviparous; whilst the *marsupial* quadrupeds and the *monotremata* form connecting links, in this part of their natural history, between the mammalia which are viviparous in the fullest sense of the term, and the warm-blooded animals (birds) which are oviparous.

To the articles Reproduction and Development of the Embryo, we must refer for an exhibition of the differences between oviparous and viviparous reproduction, and of that original and essential agreement in important particulars, which has been strongly asserted in the saying, *Omne animal ex ovo* (Every animal is produced from an egg). To the article Development of the Embryo also reference must be made for what may be called the *history* of the E., and the development and uses of its several parts.

The number of eggs varies extremely in different animals, some birds producing only one at a time, or in a year, others twenty or nearly so, whilst the roe of the herring, cod, and many other fishes, contains myriads of eggs. The eggs of some animals are enveloped in a gelatinous mass; those of some are joined together, and are laid in a kind of string; those of others are connected together in various ways. For notice of such peculiarities, we must refer to the articles on different classes of animals.

The economical uses of eggs are well known. The eggs chiefly used are those of birds, although the eggs of turtles are also in great repute as an article of food and luxury, and those of fresh-water tortoises are valued for the oil which they yield. The birds' eggs chiefly used for food are those of the species commonly domesticated as poultry, and others allied to them—gallinaceous birds and web-footed birds. Of gallinaceous birds, the common domestic fowl, the turkey, the peahen, and the guinea-fowl, produce the eggs most generally used and brought to market in different parts of the world; of web-footed birds, the common duck is in this respect the most important, although the eggs of other *anatidæ* are also used for food, and those of some of the other web-footed marine-birds are much sought after by the inhabitants of the wild and rocky shores which they frequent. Thus, the eggs of gulls and guillemots afford an important article of food to the people of St. Kilda, and of some of the Orkney and Shetland

islands, as well as to the inhabitants of Iceland and other far northern regions. It is in quest of eggs, as well as of young birds, that the dangers of the most tremendous precipices are braved by men whom their companions let down by ropes, and who gather the eggs from the rock ledges. The coasts of Labrador are also visited by *eggers*, who collect the eggs of sea-birds, and carry them for sale to some of the American ports. The eggs of some of the sea-birds of the West Indies are of considerable commercial importance. See EGG-BIRD.

EGG, AUGUSTUS LEOPOLD, 1816–63; b. London; painter and member of the royal academy. He was a well-trained and talented painter of *genre*, chiefly of compositions from poets and novelists. At the time of his death he might be ranked among our best painters in his special class, but he had no marked originality of style. Among his works are "Queen Elizabeth Discovers She is no Longer Young;" "Peter the Great Sees Catherine for the First Time;" "Charles I. Raising the Standard at Nottingham;" "The Night Before Naseby;" and the dinner scene from the *Taming of the Shrew*.

EGG, CHEMISTRY OF. An ordinary good-sized hen's egg weighs about 1000 grains, of which the white constitutes 600 grains, the yolk 300, and the shell 100. The white or glaire of the E. is a strong solution of albumen (q.v.) in water, and whilst readily miscible with water in its ordinary state, it becomes insoluble when subjected to heat, as in boiling an egg. In 100 parts, the white or glaire of E. consists of—water, 80; dry albumen, 15½; salts, etc., 4½. The yolk or yelk of the egg is composed of a strong solution of albumen, through which multitudes of minute globules of oil are suspended, which render it essentially an emulsion. In 100 parts, it consists of—water, 53¾; dry albumen, 17½; oil (with small proportion of salts), 28¾.

EGG, or EIGG, an island 12 m. off the w. coast of Inverness-shire, and 8 m. s.w. of the s. point of Skye. It is 4½ m. long by 2½ broad. It consists chiefly of trap, which in the n. alternates with sandstone and limestone, the latter rocks containing oolitic fossils, carbonized wood, and coal. The scuir of Egg, in the s.w., rises 1339 feet. The upper 470 ft. of this hill is a mass or vein of pitchstone, 1¼ m. long, and 100 ft. broad. Some of the pitchstone forms straight, inclined, or curved columns, from a few inches to nearly two feet in diameter. In one place, the pitchstone overlies red sandstone, conglomerate, trap, and the silicified wood of an oolitic pine. In the s. part of the isle is a large cave, entered by a narrow opening, through which only one person can creep at a time. Here it is traditionally related that the laird of Macleod, to revenge an injury done to some of his clan, smoked to death all the inhabitants (200 Macdonalds) of the isle, who had hid themselves in the cave. Pop. '71, 282.

EGG, MUNDANE. See MUNDANE EGG.

EG'GA, a large t. of western Africa, Yaruba country, is situated on the right bank of the Niger, in lat. 8° 43′ n., long. 6° 20′ east. It is said to be 2 m. long. Its streets are narrow; the houses are principally huts built of clay, the walls smooth, and stained with indigo. Great quantities of narrow cotton cloth, only a few inches in breadth, and generally dyed blue, are manufactured here. The inhabitants are enterprising and commercial, many of them possess canoes, in which they trade up and down the Niger. These canoes are covered by a sort of shed, under which the traders sleep at night. The chief articles of trade are beautifully carved calabashes, cloth net-work, corn, yams, sweet potatoes, dried fish, and a few European articles, as beads and gunpowder. The population, which is said to be immense, is partly Mohammedan and partly pagan.

EG'GAR MOTH, the name of certain species of moth, of the genus *lasiocampa*, allied to the silk-worm moths. One species (*L. trifolii*), of a uniform foxy ochreous color, with wings expanding about 2 in., produces a caterpillar as thick as a swan's quill, hairy, and ochreous brown, which feeds sometimes on broom, but frequently in clover-fields.

EGG-BIRD, *Hydrochelidon fuliginosum* or *sterna fuliginosa*, a bird of the gull family, sometimes called the SOOTY TERN. It is fully larger than the common tern of the British shores; has a long, slender, nearly straight, compressed, sharp bill; very long, narrow, and pointed wings, and a long deeply forked tail: the general color is glossy black on the upper parts, except the forehead and the edges of the wings, which, with the under parts, are white. It abounds in the West Indian seas, and is to be seen in myriads on and near some of the *keys* or low barren islets where it breeds. When visitors land on these keys, the disturbed birds rise and fly about in clouds which darken the air, whilst their turmoil overpowers even the roar of the breakers. The nest of the egg-bird is merely a little excavation in the sand, and usually contains three eggs, which are fully 2 in. long, of a pale-cream color, sparingly marked with light-brown and purple tints. The eggs are esteemed delicious, and form an object of profitable adventure in the months of Mar., April, and May, to the crews of numerous small vessels, fitted out from Kingston, Havana, and other West Indian ports. Curious customs prevail among the egg-gatherers at the most frequented keys, and common consent has established a kind of code of laws among them. The eggs remain fresh and fit for use only for a short time. Along with the egg-bird, those of the noddy are also gathered, and those of the sandwich tern and other allied species; and the name egg-bird, with some prefix, is sometimes extended in the West Indies to several of the terns.

EGG-PLANT, *Solanum melongena*, an annual usually less than 2 ft. high, with stem partially woody; fruit very much resembling an egg in appearance, and varying in size from that of a hen's egg to that of a swan's egg, in color generally white, yellow, or violet. The fruit is much used as food, not only in the East Indies, of which the plant is a native, but in warm countries generally. The fruit is known by various names—as egg-apple, auberjine, brinjal, etc.

EGG TRADE. English poultry does not supply eggs in sufficient quantity to meet the home demand, on account partly of the large consumption in manufactures. The deficiency is made up by importations, chiefly from France. There are no means of ascertaining the number of eggs produced by English poultry in the course of a year; but the importations are recorded in parliamentary papers. These importations have largely increased within the last few years. In 1844, they amounted to about 67 millions; in 1860, to nearly 160 millions; and in 1871, to 380,668,000, of the value of £1,263,612. Of this enormous amount 281,530,440 came from France. Germany sent us 49,120,160; and even Spain, Portugal, and the Azores, owing to our fleet steamships, are not too far off to supply our markets with fresh eggs. In 1875, above 600,000,000 eggs were imported, value £2,561,433. The imported eggs are seldom equal in quality to those home-produced; they are often packed in damp straw, the odor from which penetrates the shell, and imparts an unpleasant flavor to the egg. There is a certain warmth in new-laid or good eggs, which tends to ferment the damp straw, or other substance in which they are packed, and this fermentation reacts upon the eggs in the way stated. Until the removal of the duty, imported eggs paid 4*d.* per cubic ft. if from British possessions, and 8*d.* if from foreign countries.

EG'HAM, a village in the n.w. of Surrey, on the left bank of the Thames, 18 m. w. of London. In the vicinity is Runnymede, a meadow on the Thames, where king John conferred with his barons before signing the Magna Charta in 1215. Near also is Cooper's hill, rendered famous by Denham and Pope.

E'GINHARD, or EINHARD, the biographer of Charlemagne, was b. towards the end of the reign of Pipin, or the beginning of that of Charlemagne. At an early age, he repaired to the court of the latter monarch, and became a pupil of Alcuin. His talents and acquirements gained him the favor of the emperor, who appointed him his private secretary, and superintendent of public buildings. E. accompanied the Emperor in all his marches and journeys, never separating from him except on one occasion, when he was dispatched by Charlemagne on a mission to pope Leo. On the death of the emperor, he was appointed preceptor to Lothaire, son of Louis le Débonnaire, and for a number of years afterwards appears to have been lay abbot of various monasteries; but ultimately becoming tired of secular life, he retired to the secluded town of Mühlheim. Here he erected a monastery, and changed the name of the place from Mühlheim to Seligenstadt (City of the Blessed). He is said to have now become a monk, but this is scarcely authenticated. E. died 14th Mar., 840, and was buried beside his wife, who died in 836. The two coffins are now shown in the chapel of the castle at Erbach. The counts of Erbach trace their descent from Eginhard. His *Vita Caroli Magni*, completed about the year 820, with respect to plan and execution, as well as language and style, is incontestably the most important historical work of a biographical character that has come down to us from the middle ages. It was frequently used as a school-book, and was therefore copied *ad infinitum*. The best German edition is that of Pertz, in the *Monumenta Germaniæ Historica*. His *Epistolæ*, 62 in number, are also of considerable value in a historical point of view. The French consider the edition of E.'s works by M. Teulet, with a translation, and life of E. (1848), to be the best and most complete. E.'s second work, the *Annales Regum Francorum, Pippini, Caroli Magni, Hludowici Imperatoris*, embraces the period from 741 to 829. According to a pretty legend, E.'s wife, Emma, was a daughter of Charlemagne. A mutual affection had arisen between them, and on one occasion when the lovers were enjoying a nightly interview, a sudden fall of snow covered the spacious court, thus rendering retreat impossible without leading to a discovery. As the traces of female footsteps could not excite suspicion, Emma carried her lover across the court on her shoulders. This scene, it is said, was observed from a window by Charlemagne, who united the affectionate pair in marriage. On this legend Fouqué founded his romance of *Eginhard and Emma*, and Longfellow has made it the subject of a short poem.

EG'LANTINE, a name sometimes given to the sweet brier (*rosa rubiginosa*), but also sometimes to other of the smaller-flowered species of rose.

EGLINTON AND WINTON, ARCHIBALD WILLIAM MONTGOMERIE, Earl of, K.T., twice lord-lieutenant of Ireland, was b. at Palermo, in 1812. He was a well known patron of the turf and field-sports, and his name is particularly associated with a splendid revival of the mediæval tournament, which he gave at Eglinton castle in 1839 (see TOURNAMENT). Lord E., who was at various times lord-lieutenant and sheriff-principal of Ayrshire, lord-rector and dean of the faculty of Glasgow university, etc., died in 1861.

EGMONT is the name of the principal harbor of the Falkland isles, and of an active volcano in New Zealand, besides several other unimportant places.—1. Port E. is on the n. coast of the more westerly of the principal two islands of the group, its seaward

barriers being the islets of Keppel and Saunders. It is in lat. 51° 21′ s., and long. 60° w. The anchorage is good; and the shores afford fresh water, but are almost destitute of wood.—2. Mount E. is on the northerly island of its own group, rising 8,340 ft. above the sea. It is 18 m. s. of New Plymouth, in lat. 39° 15′ s., long. 174° 13′ east.

EGMONT, LAMORAL, Count, PRINCE OF GAVRE, was b. in the castle of La Hamaide, in Hainault, in 1522; and inherited his property and titles from his elder brother Charles. He accompanied Charles V. on his expedition against Algiers in 1541, and followed that monarch afterwards in all his campaigns, but without distinguishing himself greatly. After the accession of Philip to the throne, E. commanded, with great success, the cavalry, in the battle of St. Quentin, 1557, and next year in that of Gravelines; and when Philip finally returned to Spain, he left E. governor of Flanders and Artois. In this position, E. entered into alliance with the party in the Netherlands that were dissatisfied with the Catholic policy of Philip, and from a courtier became all at once a man of the people. His proud, imperious character, however, and his subsequent conduct, have induced many to suppose that, like his bosom-friend, the prince of Orange, he was less actuated in this by high motives than by self-interest, or at least by disappointed ambition. The more common opinion, however, is, that he was a humane and virtuous patriot, who, although indifferent to Protestantism as a religion, was anxious to do justice to all the members of that oppressed faith. When Margaret, duchess of Parma, against the will of the Protestant party, was made regent-general of the Netherlands, E. and the prince of Orange entered the council of state, and held the command of the few Spanish troops. At first he sided with the party who were discontented with the infringement of the liberties of the provinces, and the introduction of the inquisition; but when insurrection broke out, he at last broke with the prince of Orange and the "Beggars' league," as it was called. He seemed to have restored order, and to be maintaining it, when, in April, 1567, the duke of Alba was sent as lieut.-gen. to the Netherlands. The prince of Orange and other chiefs of the insurrection left the country; E. wishing to save his private property, remained, thinking his return to the court had secured his safety. When Alba entered Brussels, 22d Aug., E. went to meet him, and sought to secure his favor by presents. He appeared to have gained his confidence, when suddenly, after a sitting of the council, he and count Hoorn were treacherously seized, and carried to the citadel of Ghent. The states of Brabant sought to withdraw E. from the bloody tribunal, as it was called, instituted by Alba, and E., as a knight of the Golden Fleece, denied its competency. But all in vain. He was called upon to justify himself against 90 counts of accusation; and as he persisted in protesting against the incompetency of the court, and thus left many of the points unanswered, he was held guilty of contumacy, and along with count Hoorn condemned to death. On the following day, June 4, 1568, they were both beheaded in the market-place of Brussels. Although E. hoped for pardon to the last, and intercession was made for him from the highest quarters, he died with the greatest composure. It is related that as he received the fatal stroke, Johanna Lavil, who had been his mistress, fell down dead, and the people, in a paroxysm of sympathy, dipped handkerchiefs in the blood that seemed shed in martyrdom to freedom. E. left 11 legitimate children, of whom 3 were sons. The whole of his property, movable and immovable, was confiscated with the greatest rigor. See *Correspondance de Marguerite d'Autriche, Duchesse de Parma* (Bruss. 1842), and *Correspondance de Philippe II. sur les Affaires des Pays-Bas* (Bruss. 1848–51, 2 vols.). Goethe has made the death of E. the subject of a tragedy.

EGRET, a name often given to various species of heron (q.v.), particularly those which, at least during the breeding season, have the feathers on the lower part of the back lengthened and their barbs loose, so that this part of the plumage is very soft and flowing. Most of the egrets have beautiful white plumage. The distinction between egrets and other herons is not, however, very strongly marked, and the names are often used indiscriminately, although the name E. is never given to the common heron. E. plumes are used for ornamental purposes, particularly the occipital crest and scapulars of the LITTLE E. (*ardea garzetta*); and the name E. (Fr. *aigrette*) has become a common term for a tuft of feathers, although it is said to be derived from the French *aigre*, harsh, on account of the harshness of the voice of the bird. In old English bills of fare, egrets are mentioned as if they were abundant; and not fewer than 1000 "egrittes" are included in the bill of fare of a single great feast, given at the enthronization of George Neville, archbishop of York, in the reign of Edward IV.; but as there is no other evidence that any species of E. was ever otherwise than of very rare occurrence in Britain, great probability seems to attach to the opinion originally advanced by Dr. Fleming, that perhaps the lapwing might be meant, "the most common bird with a crest."

EGYPT, a country in n.e. Africa, extending from the Mediterranean to the first cataract of the Nile, that of Syene, from lat. 24° 6′ to 31° 36′ north. The name is derived from the Greek *Aigyptos*, a word of uncertain derivation, and as old as the age of Homer. In the hieroglyphs and Coptic, it was called *Kemi* or the Black land, from the color of the soil, and by the Hebrews *Musr* or *Mitsraim*, modified by the Assyrians into *Musr*, and by the Persians into *Mudraya*. The country may be described as the bed of the

Nile, the cultivated territory only extending to the limits of the inundation. This river runs from the cataracts of Assouan, in a northerly direction, to Denderah, where there is one great bend to the w.; and a few miles n. of Cairo (lat. 30° 15' n.), the river divides into two main streams, forming the Rosetta and Damietta branches. The other five mouths, which existed in antiquity, have silted up; the alluvial district inclosed by these mouths, and supposed by the ancients to have been gained from the sea, formed the ancient Delta. The basin of the Nile is formed by the ranges of the Arabian hills on the e., and the Libyan on the w. side. The rate of deposit of mud is supposed to be about 6 in. in a century. The eastern chain of mountains rises to about 1000 ft. above the level of the sea. The great physical peculiarity of E. is the absence of rain, the land being only irrigated by the annual overflow of the Nile. The climate is remarkably mild and sound, especially s. of the Delta; and in the desert, from Cairo to Alexandria, the air contains more moisture than to the south. From the middle of Aug. to Dec., w. winds prevail; e. winds from that time till Mar.; after that, unhealthy s. winds or Khamsin till June; and from June till Aug. the n. or Etesian winds. Earthquakes are occasionally felt; and the temperature varies from 84° F. to 32°. The most remarkable phenomenon is, however, the regular increase of the Nile, fed by the fall of the tropical rains, which commence in 11° n. lat., in the spring; and falling first into the White, and then Blue Nile, reach E. in the middle, and the Delta in the end of June. In the middle of July, the red water appears, and the rise may be dated from that time; it attains its maximum at the end of Sept., and begins to decline visibly in the middle of Oct., and subsides to its minimum in April. At the end of Nov. the irrigated land has dried, and is sown, and is covered with green crops, which last till the end of Feb. In Mar. is the harvest. The state of the Nile, in fact, marks the season more accurately than the variation of temperature. E. is by no means remarkably healthy, as, in addition to the visitations of plague and cholera, ophthalmia, diarrhea, dysentery, and boils often prevail, and European, and even Nigritic races cannot be acclimatized.

Geology.—E. is separated from Nubia by a low hilly region about 50 m. broad from n. to s., composed of granitic rocks. The same crystalline rocks extend up the shore of the Red sea to near the opening of the gulf of Suez, stretching inland for fully 30 miles. The scenery in this district is wild and rude, and the course of the Nile is frequently interrupted by cliffs and broken masses of granite, forming magnificent cataracts. The granitic region terminates at Assouan, the ancient Syene. From the rocks here were obtained the materials for the colossal and monolithic monuments of Egypt. The valley of Upper E. is bounded by two ranges of hills running northward—the Arabian range on the right, the Libyan on the left of the river, both alike composed of cretaceous strata, the predominant rock being sandstone. This is a durable and easily worked stone, and was consequently extensively used in the erection of ancient temples. The city of Thebes was built of it. The cretaceous sandstone extends from the granitic rocks forming the first cataract at Assouan for about 85 m. to Esné, where it is covered by a limestone belonging to the upper chalk series. This continues on both sides of the valley for about 130 m., when it is covered by a tertiary nummulite limestone, which forms the further prolongation northward of both ranges of hills. Because of the easy disintegration of these beds, the scenery in the limestone districts is tame and monotonous; frequent table-lands occur, on one of which are built the three pyramids of Gizeh, the material employed being the predominant limestone.

Over a large extent of E., these rocks are covered with moving desert sands, and in the flat lands bordering the Nile, with the alluvium brought down by its waters, and which has formed the delta at its mouth. This alluvium consists of an argillaceous earth or loam, more or less mixed with sand and a quartzose sand, probably derived from the adjacent deserts by violent winds. It is remarkable that this sedimentary deposit has no traces of stratification, and also that within short distances, great varieties are observed in what are apparently synchronous deposits. Mr. Horner's recent examination of the Nile deposits, and the striking conclusions he deduces from his observations, have caused considerable attention to be paid to these deposits lately. See MEMPHIS.

Natural History and Productions.—The fertile valley of the Nile and the desert regions which inclose it, are very different, not only in their botany, but in their zoology. One of the most notable of Egyptian quadrupeds is the hippopotamus, which formerly reached the Delta, but is now to be seen only in the more southern parts of the Nile. The giraffe is occasionally found within the southern borders of Egypt. The jackal and hyena are common; also the ichneumon (q.v.), so much celebrated among the ancients; and the jerboa. The one-humped camel was originally introduced by the Ptolemies for the transit of the Indian trade. The other usual domestic quadrupeds have existed from the most ancient times. Of domestic birds, water-fowl were anciently the most numerous; the gallinaceous poultry now common not being probably of older date than the Persian invasion. Pigeons have always been abundant. The Egyptian vulture (q.v.) is a common and notable bird, as is also the ibis (q.v.), held sacred by the ancient Egyptians, and of which many fables have been related. The ostrich sometimes occurs in the desert. Of reptiles the most famous is the crocodile of the Nile: monitors (q.v.) are also abundant, saurian reptiles of considerable size. Smaller lizards abound. The trionyx, or soft tortoise, is plentiful in the Nile. Serpents are numerous; amongst the

most venomous and dreaded of which are the asp (q.v.), or haje, and the cerastes (q.v.). E. abounds in fish, the most remarkable being the binny (see BARBEL), the *latus* (one of the perch family), the bayad or *silurus*, the *chromis nilotica*, and the *mormyrus oxyrhynchus*. The sacred beetle (*scarabæus sacer*) is one of the most remarkable insects. Locusts are a dreaded pest. E. is still notable also for the abundance of the other creatures mentioned by Moses as its plagues.—Many of the European trees and plants are found in E.; the date-palm, the doom-palm, the sycamore, acacias, tamarisks, etc., are among its more peculiar botanical productions; also the papyrus (*p-apu*), which anciently supplied material for paper, and the lotus (*shnin*) or water-lily of the Nile. The extensive culture of the papyrus has been, in modern times, replaced by that of the sugar-cane, cotton, indigo, and tobacco; and the plant has almost disappeared. Gourds and melons have always abounded. To the wheat and barley of antiquity have been added maize and durra. E. is very deficient in timber trees; the Pharaohs obtained cedar from Lebanon and ebony from Ethiopia. The rocks of E. afforded the stones used in its edifices and sculptures; granite, syenite, basalt (at Assouan), breccia (in the Cosseir Rood), porphyry (from the quarries of Gebel Doshan, opened in the reign of the emperor Claudius), sandstone, and limestone. Alabaster (found at Tel-el-amarna) has been used from the earliest periods to the present day. Emeralds are produced by the mines of Gebel Zabara; salt, natron, and—since 1850—sulphur, are among the other mineral productions of Egypt.

Divisions.—The country was anciently divided into 44 nomes—22 in Upper, and as many in Lower Egypt. Each nome or department had a separate local municipal government of a monarch or lieutenant-governor, *ha*, besides governors of the cities, of the temples, scribes, judges, and other functionaries. Their limits were measured and defined by landmarks. This division, as old as the 4th dynasty, varied in number at different times. Under Sethos I. or Sesostris, there were 36 nomes—10 in the Thebaid, 10 in the Delta, and 16 in Middle Egypt. At the time of the geographer Ptolemy, there were 47—the Antinoites having been added. The country beyond the cataracts to Hierosycaminos was named at the Roman period Dodekaskoinos. In 400 A.D., E. was divided into Augusta Prima and Secunda on the e., and Ægyptiaca on the w., the Heptanomis as far as Oxyrhynchus was named Arabia, then Thebais Proxima as far as Panopolis, and Thebais Supra to Philæ. Under the Arabs, E. has been divided into Masr-el-Bahri or the Delta; the Faioum, El Bostani, or Middle Egypt; and Es Said or Upper Egypt. In addition to E. proper, Nubia, Darfur, and extensive territories on the upper Nile are now subject to the ruler of E., whose dominions thus embrace 1,400,000 sq. miles.

For a description of the most remarkable antiquities of E., see ABOUSAMBUL, ALEXANDRIA, EDFOU, MEMPHIS, THEBES; also NILOMETER, OBELISK, PYRAMID, etc.

The *population* of the country must have been large at the earliest period, as 100,000 men were employed in the construction of the great pyramid alone during the 4th dynasty. It has been placed at 7,000,000 under the Pharaohs, distributed in 1800 towns, which had increased to 2,000 under Amasis, 525 B.C., and upwards of 3,000 under the Ptolemies. In the reign of Nero, it amounted to 7,800,000. The pop. in 1844 was 2,500,000; in 1859, 5,125,000; and in 1879, including Nubia, Darfur, and other dependencies, nearly 17,000,000, of whom 5,200,000 inhabited E. proper. The great bulk of the inhabitants consist of native Mohammedans; the Copts (q.v.) are estimated at 150,000; and the rest are composed of Bedouin Arabs, Negroes, Abyssinians, Turks, Syrians, Greeks, Armenians, Jews, and western Europeans. The original population appears, both from the language and the physical conformation of the mummies, to have been of Asiatic origin, afterwards blended with Ethiopian by subsequent irruptions and conquests; but there appears to have been an aboriginal race at an early period, of copper color, fair proportioned, although with rather thin legs, large feet, rather high cheek-bones, and large lips. According to Herodotus, Diodorus, and Plato, the system of castes prevailed in Egypt. The first of these authors says there were seven castes—of priests, warriors, cowherds, swineherds, innkeepers, interpreters, and pilots. Diodorus makes only five—priests, soldiers, cultivators, shepherds, and artisans; and Plato the same. The evidence of the monuments, however, shows that these were rather conditions of society than castes, as the different orders not only intermarried, but even, as in the case of priests and soldiers, held both employments. As in all bureaucracies, the sons often obtained the same employments as their fathers.

Religion.—The Egyptian religion was a philosophical pantheism, the various attributes of the deity being divided amongst the different gods of the Pantheon. Unlike the Greek, where a god was honored in a separate temple, each Egyptian divinity was accompanied by a *put* or "company" of companion-gods. The principal nomes and cities had each a family group of gods, consisting of a parent deity, a wife and sister, and a son. Thus Ptah or Vulcan, the eponymous and principal god of Memphis, formed a circle with the goddesses Pasht and Bast; and his son Nefer Tum, Amen Ra at Thebes, was allied with Mu, Nit, and Khonsu. These tetrads, or rather triads, for the female principle was dualized, were often accompanied by inferior deities; and personifications of the elements, passions, and senses, and feelings were introduced. The worship of some triads, however, became universal—that of Osiris, Isis, and Horus being found all over E. at the earliest period. The gods, indeed, are stated by the Greeks to have been

divided into three or more orders. The first contained eight gods; the second twelve; the third, an unknown number. The eight gods of the first order were Ptah, Ra, Shu, Seb, Osiris, Set or Typhon, and Horus, according to the Memphite; and Amen, Mentu, Atum, Shu, Seb, Osiris, Set, Horus, and Sebak, according to the Theban version. Great uncertainty prevails about the gods of the second and third order, and still greater difficulty about the genesis and nature of the gods, different doctrines prevailing at different times and places; and the tendency to fuse different gods into one, particularly at a later period: Amen Ra, for example, being identified with Horus; and Horus, Ra, Chnum, Mentu, and Tum being merely considered the sun at different periods of his diurnal course. Very little light is thrown on the esoteric nature of the deities by the monuments, and the classical sources are untrustworthy; but the antagonism of good and evil is shown by the opposition of the solar gods and the great dragon Apap, a type of darkness, and the hostility of Osiris and Set or Typhon. Some of the gods were self-existent, others emanated from a father, and some were born of a mother only, and others were the children of greater gods. Their energies and powers differed, and their types, generally with human bodies, have often the heads of the animals which were their living emblems, instead of the human. A few foreign deities became at the close of the 18th dynasty engrafted into the religious system—as *Bar*, Baal; *Ashtarata*, Ashtaroth; *Anta*, Anaitis; *Ken*, Kiun; *Reshpu*, Reseph; *Set*, Satan. All the gods had human passions and affections, and their mode of action was material; they walked on earth, or sailed through ethereal space on boats. The principal deities are Ptah, the opener, represented as a bow-legged dwarf or fetus; the Phenician Pataikos, the creator of the world, the sun and moon, out of chaos (*ha*) or matter (*Mu*), to whom belong Pasht, "the lioness," and Bast, Bubastis, lion-headed goddesses presiding over fire, and Nefer Tum, his son, a god wearing a lotus on his head. Next in the cosmic order is Khnum—worshiped at Elephantine—the ram-headed god of the liquid element, who also created the matter of which the gods were made; and connected with him are the goddesses Heka the Frog, or primeval formation, Sati, or "sunbeam," and Anuka, alluding to the genesis of the cosmos. The Theban triad comprised Amen Ra, "the hidden" power of the sun, the Jupiter; *Mu*, the "Mother" goddess or "Matter," the Juno; *Nut*, the "Shuttle," the Minerva; and Khonsu, "Force" or Hercules, a lunar type. A subordinate type of Ammon is Khem, "the enshrined," who, as *Harnekht*, or Powerful Horus, unites beginning and end, or cause and effect. The solar worship comprises *Ra*, the Sun, who traversing the *'sha*, or empyreal space of Gates, passes each hour a separate region, and as he descends behind the w. hills of the horizon, becomes Atum, also a demiurge; while as Mentu, a hawk-headed god, he is Mars, and as Khepra, a scarab-headed god, the male creative or existent principle, and is identified with Amen, Khnum, and other deities. Day and night, Ra and his satellites pursue the Apap or "Giant" Darkness with alternate success. The souls of the blessed come off from earth, and entering the boat of Ra, there enjoy the perpetual streams of light which emanate from his orb. From *Ra* or Helios spring Shu and Tef the Gemini, Athor and Ma. *Seb* or "Time," and *Nu* or the "Firmament," gave birth to Osiris, Isis, Nephthys, Set, and the elder Horus, a group of terrestrial and infernal deities. The myth of Osiris destroyed by his brother Set, hewn in pieces, recovered by Isis, and avenged by Horus his son, embalmed by Anubis and the genii of the dead, and defended by Thoth, the Egyptian Logos, at the "great judgment" before his accusers, Set and the conspirators, was the type of the judgment and future destiny of man, and all deceased were called by his name. See OSIRIS. Numerous inferior deities, such as Hapi, the Nile, appear either as other forms of the superior deities or local varieties of the myths. Each deity had its sacred animal, which received a local worship, and which was considered to be the "second life" of the deity it represented. The special animal selected was installed in the adytum of the temple, and gave oracular responses. The most remarkable of these animals was the Apis bull of Memphis, whose worship had a national extension. The Egyptians believed in the transmigration of souls, and all not sufficiently pure to be admitted into the courts of the sun, or whose bodies had perished before the expiration of 3,000 years, passed from body to body (see EMBALMING), having first descended to the Hades, and passed through the appointed trials and regions, endeavoring to reach the manifestation to light. In this progress, the soul was required to know and tell the names of the doors, regions, and their guardian demons through which it had to pass.

Chronology and History.—One of the most important points of Egyptian history is the chronological, involving as it does the date of the earliest historical epoch of man. In the time of Ptolemy Philadelphus, in the 3d c. B.C., Manetho of Sebennytus, high-priest of Heliopolis, drew up, at the request of the king, a history, in which he divided the space of time from Menes to the reconquest of E. by Darius II. into 30 dynasties. The work of Manetho has perished, but chronological epitomes remain in the works of Julius Africanus, a writer of 300 A.D., and Eusebius, and George the Syncellus, 800 A.D. Besides the Bible, Herodotus, Diodorus, Josephus, and other writers, especially Eratosthenes, also contained sources of chronological information, and the learned of Europe for the last 3 centuries had endeavored to reconcile the conflicting statements of these authors, the discrepancy of their ciphers, and the inaccuracy of their details. Even in Biblical chronology, the Hebrew, Samaritan, and Septuagint versions gave very different results; but in England the chronology of Usher, which, from the Hebrew, placed 4004

B.C. as the date of creation, and 2348 B.C. for the deluge, has somehow obtained the sanction of theological writers. To reconcile these conflicting authorities, two schools of chronological critics, called of the long and short chronology, have arisen, and the epoch of Menes has been placed by the advocates of the long chronology, as Boöckh, at 5702 B.C., by Bunsen, at 3643 B.C., by Lepsius, at 3892 B.C., by Henry, at 5305 B.C.; while the same date falls, according to Sharpe, 2000 B.C., to Nolan, 2673 B.C., and Poole, 2717 B.C. Unfortunately, the monumental information is defective at certain periods, while in all, the national custom of dating in kings' reigns only, without the use of the controlling date of any cycle, renders the subject still more obscure; for the sothic cycle, or dogstar period of 1461 vague years, was not in official use. The celebrated hieratic papyrus at Turin, of the age of the 19th dynasty, which contained a system of chronology arranged on a principle of cyclic and regnal years, has unfortunately suffered so much mutilation that it is impossible to reconstruct it satisfactorily. It is therefore better to arrange the history according to the dynastic successions of Manetho, giving these as waves of time, leaving the question of their duration to individual judgment. At present, the elaborate systems of chronology are only chronological draughts from recollection of a vast ruin, each more or less happy or defective in some particular respects or general conception. There are not sufficient monumental data for a sure conclusion about the remoter dynasties. Mythically E. was said to have been first governed by a dynasty of gods, who, according to Manetho and other Greek authors, were Vulcan or Ptah, Helios the Sun or Ra, Sôs or Shu, Saturn or Seb, Osiris or Heshar, Typhon or Seti, and Horus or Hor. These gods reigned 13,900 years, and were succeeded by the Manes and demigods, whose reign occupied 4,000 more years. But considerable difference exists in the lists—that of Thebes giving Amen, Mentu, Tum, Su and Seb, Osiris, Seti, and Horus; that of Memphis, Ptah, Ra, Shu, Seb, Osiris, Set, and Horus. After the reigns of the gods, the epoch of Menes is the first point in the chronology of the history of ancient E., and has been placed, as above mentioned, by the rival systems of chronology.

No contemporary monuments of Menes exist, but he is said by tradition to have corrupted the simplicity of the patriarchal life of the nation, instituted the first laws and divine worship, founded the temple of Ptah, by turning the course of the Nile, by means of a barrage, to the w. at Kosheishe, and to have founded Mennefer or Memphis, after some expeditions against the Libyans, and to have been devoured by a crocodile. The statue of Menes is represented borne in ancestral procession in the reigns of Rameses II. and III. at Thebes, but no contemporary monument of this monarch exists. His successor, Athothis, wrote a work upon anatomy, and built the palace of Memphis. The other kings of this dynasty were Kenkenes, Venephes, who built the pyramids at Ko or Kochome, Miebis, Semempses, and Bieneches; but their names have not been identified, nor do any monuments of them remain. This dynasty reigned about 250 years, and was succeeded by the 2d, which lasted about 300 years, but of which no contemporary monuments remain. This dynasty, however, introduced the worship of sacred animals, and abolished the Salic law, which had hitherto prevailed. With the 3d dynasty of Memphites, which endured about 200 years, monumental history properly begins, the monumental king Seneferu of this dynasty having conquered the Sinaitic peninsula, and opened the copper mines of the Wady Magara. The 4th dynasty, also of Memphites, had an existence of 284 years. The celebrated canon of Turin contains fragments of the duration of the reigns and lives of the monarchs of this line, some of which were prolonged to upwards of 90 years. Monumental remains are found of Soris. The two Khufus built the two great pyramids of Gizeh, and held the Arabian peninsula in subjection. Cheops, or the elder of the two Khufus, constructed the largest of this group of the pyramids by means of a forced conscription, and was regarded as a detestable and impious tyrant. Subsequently, he repented, and wrote a book in honor of the gods, which enjoyed a great reputation. Khafren, his successor, built the second of the great pyramids, and Mencheres, or Mycerinus, the third pyramid. The so-called book of the ritual, which dates from this period, and the high civilization which Memphis had then attained, mark an epoch in Egyptian civilization, and the numerous tombs, in the vicinity of the pyramid, constructed during this and the subsequent dynasty, exhibit a highly progressing state of civilization; the cultivation of farms, the chase, the arts, enjoyed a great deal of the attention of the Egyptians; but horses and wheel-carriages were alike unknown, although the simpler mechanical instruments and manufactured articles had been invented.

The 4th dynasty began, according to Lepsius, 3427 B.C. The 5th, which monumentally appears a continuation of the 4th, terminates with Annos or Onnos, who was killed by his guards. His sepulchre was the pyramid of the Mastabat-el-Faraoun, near Saqqarah. This 5th dynasty was, however, from Elephantine, and appears to have ruled in Upper as well as Lower E., monuments of it being found in the Thebaid. Considerable difference, however, exists between Lepsius and Bunsen in the assignment of the royal cartouches of this period, Lepsius assigning them to the 5th, and Bunsen to the 3d dynasty. The group of the Abooseer pyramids is of this age. The next dynasty, the 6th, a Memphite, was more remarkable, and tombs and numerous small objects of the period are found in Upper and Central Egypt, and in the valley of Hamamat, leading from Coptos to the Red sea. The principal monarchs of this line were Othoes,

killed by his guards; Phiops or Apappus, whose reign extended to 100 years; and Nitocris, whom the legends represent as drowning the murderers of her brother, and constructing the third Gizeh pyramid, in which she was buried, and which she perhaps enlarged from the old original sepulcher of Mycerinus, having added to it the revetment of red syenitic granite. Of the 7th dynasty, two names, An and Assa, are supposed to have been found; but the monumental connection between the close of the 6th and 11th dynasties, has not been even conjecturally restored, from the conflicting tablets of Karnak and Abydos, and the mutilated papyrus of Turin. It is not possible to follow the order of the succession till the 11th dynasty, nor are there monuments either of a public or sepulchral nature to show the existence of the intermediate period, rendered more unintelligible by the contemptuous silence of the lists of Manetho, one tyrant, Achthoes, being alone mentioned in them. Considerable discrepancy exists between the canon of Turin and the lists of Manetho relative to this period; the canon making two dynasties—one of 6, the other of 17 kings between the 6th and the 12th dynasty; Manetho, 86 kings, and about 500 years. The impossibility of reconciling these statements has given rise to the idea, that the lists were respectively Memphite and Theban, each having contemporary kings. The existence, however, of the 11th dynasty, consisting of a line of monarchs called Hantefs and Mentuhetps, has been proved by the discoveries of their coffins in the tombs at Gournah and the El Assasifs, and the tablets of the island of Konosso and others, referring to the construction of the fortress of Coptos and in honor of the local god. The successive reigns and monarchs of the 12th dynasty are fixed by numerous monuments. Amenemha I., the founder of the line, opened the quarries of Tourah, embellished An or Heliopolis, and founded the temple of Amen at Thebes, reigning nine years alone, and seven with Osirtesen I., his successor. A historical papyrus recording his dreams and other facts of this reign remains. The monuments of Osirtesen I. exist in the Faioum at Benihassan and Heliopolis; he subjected some of the Ethiopian tribes. During his reign there occurred a famine; and in the 38th year of his reign, he associated Amenemha II. into the government for four years. Little of historical import is known of his successors, Amenemha II. and Osirtesen II., except their conquest of Kash or Ethiopia, and the arrival of a tribe of 36 Amu or Semities in the sixth year of Osirtesen II. These resemble, in their costume and physiognomy, the Hebrews, and have been supposed to represent the arrival of Jacob in Egypt. Osirtesen III., his successor, established the southern frontier at Samneh, which he fortified; and was subsequently deified in Nubia, and received, in the reign of Thothmes III., a worship in that region, and fortified Coptos. His successor, Amenemha III., excavated the Birket-el-Keroun or Mœris lake; constructed the Labyrinth, composed of 6,000 rooms; the pyramid of Crocodilopolis, in its vicinity; and the temple of the goddess Athor at the Sarabout-el-Khadem. His successors, Amenemha IV. and the queen Sebeknefru, are only known from the remains of the Labyrinth, and some inferior monuments. The same difficulty of tracing the succession which exists between the 6th and 12th, occurs again between the 12th and 15th. The most plausible conjecture, however, is that the 13th (Diospolite) and the 14th Xoite dynasty, in Lower E., were contemporaneous, and that the 15th and 16th Theban and Diospolitan had for their contemporaries the 17th Hykshos or Shepherd dynasty in Lower Egypt. The monarchs of the 14th dynasty appear from the monuments to have been occupied in regulating the course of the Nile at Samneh, while their power reached from the isle of Argo to El Hamamat, and they engaged in traffic with the Phenicians. About 2000 B.C., the advance of the Assyrians in Asia, or some internal revolution, precipitated the so-called Hykshos or Shepherd kings, who appear to have been Arabs or Phenicians, on Lower Egypt. These invaders overthrew the Xoite dynasty of Lower E., took Memphis by assault, and established themselves in the city of Haouar or Avaris, subsequently called Tanis, where their monuments still exist. But the Egyptian rulers of Upper E. overthrew their rule, and under Ra-skenen, the last king of the 16th dynasty, Avaris was invested, while his successor, Aahmes I., of the 17th, took it by assault, besieged Sarahan or Sharon, and attacked the mountaineers of Nubia. The Hykshos endeavored to substitute the worship of Sut or Set for Ra or the Sun, but Aahmes I. restored the ancient temples, and opened the quarries of Tourah. Amenophis I., his son and successor, who reigned under the tutelage of his mother, continued the Ethiopian campaigns, and embellished Thebes. Thothmes I. carried his arms to Tombos, in the heart of Nubia, and into Naharaina or Mesopotamia, and embellished Thebes. Thothmes II., who reigned under the guardianship of Hatasu, defeated the Shos. His brother and successor, Thothmes III., elevated E. to the highest pinnacle of glory; and by the victory of Megiddo, in his 23d year, subjected the whole of Syria and part of Mesopotamia to his arms, receiving immense tributes from Kash and the Ethiopian races of the S., the islands of the sea, and Assyria, Babylon, Phœnicia, and Central Asia, and endowing the temple of Thebes with the revenues of tributary cities. A calendar preserved at Elephantine recording the heliacal rise of the Dog-star on the 28th Epiphi, shows that the year 1444 B.C. fell in his reign. Thothmes III. recovered the copper-mines of Magarah, and decorated all Egypt. Amenophis II. continued the conquests of the Ruten, took Nineveh by assault, and vanquished the Ethiopians. Thothmes IV. is supposed to have erected the Great Sphinx. Amenophis III. maintained the frontiers of the empire. At this period, a

heresy became introduced into E., favored by the queen Taia. Amenophis IV. became a worshiper of the Aten or solar orb, to the exclusion of the other deities of E., especially of Amen Ra. The capital was removed to Tel-el-Amarna or Alabastron; the king changed his name to Akhuenatnen, and a succession of three heretic monarchs ruled E. for about 33 years, till Haremhebi or Horus restored the orthodox faith and the limits of empire.

The link which connects the last monarchs of the 18th to the monarchs of the 19th dynasty has been lost; but Horus was succeeded by Rameses I.—the first of a long line of monarchs—who appears to have formed a treaty with the Khita or Hittites, and to have advanced the conquests of E. to the Wady Halfa. He was succeeded by Seti I. or Sethos, who attacked the Remenu or Armenians, the Rutennu, and the Shasu or Shepherds, who had again advanced to the Pa-khetem or Pithoum, on the confines of Egypt. Naharaina or Mesopotamia, and Sharu or Syria, Pânt or Phœnicia, had also been invaded by his arms. The city of Atsh or Katsh, the supposed Cadytis, was also besieged by Sethos, whose Asiatic victories introduced into E. the worship of Baal and Ashtaroth. Tyre, Avathus, and Bethanath in Canaan, were garrisoned by his forces. E. was also embellished with many noble monuments in his reign. He was buried in a deep, excavated rock-tomb in the Biban-el-Molook—the kings of the 18th and 19th dynasties having substituted long, excavated tunnels or syringes, in the mountains of the Arabian chain of Western Thebes, for the ostentatious pyramids in use from the 4th to the 12th dynasty, which attracted the cupidity of the invaders of Egypt. Rameses II., the son of Seti I., seems to have succeeded him at the very youthful age of seven. In his fifth year, he defeated the Khita and their Syrian confederates at the battle of Katsh, in which many of the princes and officers of the Khita were drowned in the river Arunata, or Orontes. The battle endured two days, and the panegyric of an Egyptian scribe, Pentaur, has invested Rameses with the power of a god. The war lasted till his ninth year, and the king took Shaluma or Salem, the ancient site of Jerusalem, and other cities. In his twenty-first year, a treaty of peace and extradition was established between the two countries, and Rameses married a princess of this nation. It is the tablet of this monarch which is found at the Nahr-el-Kelb, or Passes of the Lycus, near Beyrout. This monarch subjected Ethiopia, which had revolted, to his arms, reimposed the tribute, and placed the country again under the government of the princes of Ethiopia, or Egyptian viceroys. He also established a fleet on the Mediterranean. His name and reputation formed the basis of the legendary Sesostris; the exploits of the monarchs of the 18th dynasty, and probably of his successors, being united with his fame. The reign of Rameses, although it exhibits a decline of art, yet demonstrates E. to have been in the height of its glory; and his epoch appears to have been about 1322 B.C., a special calendar having been sculptured to record the coincidence of the heliacal rising of the Dog-star and 1st Thoth, or commencement of the fixed and canicular year. His place of burial is uncertain—perhaps in the vaults of the Ramesseum. His thirteenth son, Merienptah or Menephthes, succeeded him upon the throne, transferred the capital to Memphis, successfully contended with the Tamahu or Libyans and the Rabu, and appears to be the Amenophis of Manetho, and the Pharaoh of the Exodus. He introduced the heretical worship of Sut, Seth, or Typhon, and was succeeded by Sethos II., Amenmes, Sipthah, Tausri, and Setinekht, whose inglorious reigns close the 19th dynasty. The connection of Rameses III. with the previous dynasty is obscure. This monarch was chiefly at war with the Philistines, and the other maritime tribes of Greece and Asia Minor, and gained naval victories in the Mediterranean, and repeated the conquest of Ethiopia. He was followed by the splendid but inglorious line of the Ramessids, the sixth of whom gained victories in Ethiopia; and the twelfth of whom, having married a princess of the land of Bakhten, sent the ark of the god Khous to Bakhten, at the request of the monarch of that country, for the cure of the queen's sister. The fall of this dynasty appears to have been owing to internal revolution, as their Tanite successors held the office of high-priests of Amen Ra at Thebes. They held the government for 130 years, and entertained foreign relations, one of the monarchs having married a princess of the Rutennu. The 22d dynasty, the monumental, is rather confused. They were also high-priests of Amen Ra. Shashank I. is the biblical Shishak. His invasion of Israel, with 12,000 chariots and 60,000 cavalry, and the capture of Jerusalem, is recorded on the portico of the Bubastites at Karnak. The other monarchs of this line, Osorkon I., Takelot I., and their successors, have left no remarkable records; and the dynasty, which appears of foreign origin, is more chronologically than historically important, the taking of Jerusalem falling between 989 and 959 B.C. The 23d Tanite dynasty, which succeeded it, exhibits a decadence in E., and was succeeded by the 24th dynasty, of a single monarch, the celebrated Bekenrenf or Bocchoris, who reformed the laws; but having been taken prisoner by the Ethiopian Sabaco, of the 25th dynasty, was burned alive. From this period, the history of E. becomes involved with that of Judea and Greece. Tirhaka came to the assistance of Hezekiah against Sennacherib, and built the temple of Gebel Barkal. According to this Assyrian cuneiform inscription, the Ethiopians were expelled by the Assyrians, and the country placed under various monarchs. This state of affairs was closed by the rise of Psammitichus I. of the 26th dynasty, who, by the aid of Greek mercenaries, overthrew the other petty princes. His age marks a revival in art, and restoration of the old constitution of the

empire. His successor, Nekao or Nechos II., planned the canal across the isthmus of Suez, from which he desisted, warned by the advice of an oracle, after having lost 120,000 men in the attempt. Under his reign, the Phœnician navigators first passed the line. After defeating Josiah, king of Judah, and conquering Palestine, he was himself defeated by Nebuchadnezzar at Karkemish. Psammitichus II. carried his arms into Ethiopia. Apries, his successor, having lost all the conquests, was deposed by Amasis, his successor, and strangled. Amasis favored in different ways the Greek colonies in E., and married a Cyrenean wife, and conquered Cyprus, but incurred the enmity of Cambyses, who overthrew his son and successor at the battle of Pelusium (526–527 B.C.). Cambyses treated E. with considerable moderation, but after an unsuccessful expedition against the Ethiopians, lost his reason, stabbed the bull Apis, and committed various atrocities. His successor, Darius I., governed E. with more prudence; but Xerxes I. and Artaxerxes I. had successively to reduce it to subjection, which they did in spite of assistance rendered to it by the Athenians. The 27th dynasty of Persians was followed by the Saite line, the 28th, Amyrtæus and Pausiris, who still held ground against the Persians; the 29th, Mendesian dynasty of Nepherches and Achoreus, maintained a Greek alliance; and the 30th, Sebennytic, consisted of Nectanebes I., who successfully resisted Pharnabazus and the Iphicrates; of Teos, who employed Agesilaus; and Nectanebes II., who fled into Ethiopia before the Persians (340 B.C.).

From this time, E. remained a province of Persia till its conquest by Alexander the great, who founded Alexandria. Subsequently, E. passed under the Greek rule, and the language of the government, and the administration and philosophy, became essentially Greek. The court of the Ptolemies became the center of learning and philosophy; and Ptolemy Philadelphus, successful in his external wars, built the museum, founded the library of Alexandria, purchased the most valuable of manuscripts, engaged the most celebrated professors, and had the Septuagint translation made of the Hebrew Scriptures, and the Egyptian history of Manetho drawn up. His successor, Euergetes, pushed the southern limits of his empire to Axum. Philopator (221–204 B.C.) warred with Antiochus, persecuted the Jews, and encouraged learning. Epiphanes (204–180 B.C.) encountered repeated rebellions, and was succeeded by Philometor (180–145 B.C.) and Euergetes II. (145–116 B.C.), by Soter II. and Cleopatra till 106 B.C., and by Alexander (87 B.C.), under whom Thebes rebelled; then by Cleopatra Berenice, Alexander II. (80 B.C.), and Neos Dionysus (51 B.C.), and finally by the celebrated Cleopatra; and after the battle of Actium (30 B.C.), E. passed into the condition of a province of Rome, governed always by a Roman governor of the equestrian, not senatorial rank.

The most important events in E. under the Roman rule were—the introduction of the Julian year by Augustus (24 B.C.), the visit of Vespasian to Alexandria (70 A.D.), and that of Hadrian (122 A.D.), the development of the Gnostic heresy, the visit of Caracalla (211 A.D.), the conquest of E. by Zenobia (270 A.D.), the revolt of Firmus (272 A.D.), the persecution of Diocletian (304 A.D.), and the rise of Manicheism, the great Arian controversy in the reign of Constantine, the rise of asceticism, magic, and astrology, and the final destruction of paganism (379 A.D.).

At the division of the empire (395 A.D.), E. fell to the Eastern empire, and, at its fall, had become one of the great patriarchates of the Christian church; but owing to the religious feuds of the Jacobites and Melchites, it became a province of Persia (616 A.D.) for 12 years. The Coptic governor Makaukas, who reigned in the name of Heraclius, endeavored to make himself independent, and invited the arms of the Arabs, and Omar I. easily conquered E., in the nineteenth year of the hegira (640 A.D.).

History since the Mohammedan Conquest.—Although Alexandria was retaken by Constantine III., the Arabs drove him out, and E. remained an appanage of the caliphat. It afterwards passed into the dynasty of the Thonlounides (868 A.D.): a new dynasty, the Akshidide, succeeded in 935 A.D., to give way to the Fatimide in 969 A.D., under which Cairo was built, and E. regained some of its prosperity, although in 1118 A.D. Baldwin I. burned the maritime town of Faramah. Subsequently it passed under the Ayoubites, and Saladin, who fortified Cairo, built the citadel, excavated the well, and erected the granaries of Jusuf. In 1218 A.D., the crusaders took Damietta, but were subsequently driven back in 1221 A.D. One of the later princes, Saleh-Nedjim Eddin, built the castle of Rhodah, and created the order of Mamelukes; but Louis IX. of France (1248 A.D.) took Damietta and gained the battle of Mansourah. In 1254, the Ayoubites entirely fell, and E. became subject to the Baharite and Bordjite Mamelukes, under whose government it flourished, and even pushed its conquests to Cyprus and Asia Minor, till, in 1517, Touman Bey fell into the power of Selim I., and E. became a province of the Turks, and administered by pashas. In 1601, the use of tobacco was introduced. Constant rebellions of the Mamelukes, and the violence of contending factions, distracted the country. The most remarkable event of this period was the French invasion by Bonaparte in 1798, which, by the conquest of Alexandria, and the battle of the Pyramids against the Mamelukes, led to the entire subjection of the country, from which the French were finally expelled by the Turks and British in 1801, and the country restored to the Ottoman Porte. The rise of Mohammed Ali in 1806 imparted a galvanic prosperity to E., by the destruction of the Mamelukes, the formation of a regular army, the increase of security, the improvement of the irrigation, and the introduction of European civilization. In 1816, Mohammed Ali rendered part of Arabia

tributary by means of his son-in-law, Ibrahim; and afterwards wrested Syria from the Porte, and held it as tributary by the treaty of Kutahia in 1835. The victory of Nisib, in 1839, would have elevated him to the throne of Constantinople; but the quadruple alliance in 1840, the fall of St. Jean d'Arc to the British, and the evacuation of Syria, compelled him to limit his power to the pashalik of Egypt. Ismail Pasha reduced Nubia to a dependency of Egypt in 1820. In 1849, Mohammed Ali died, and was succeeded by Abbas Pasha, his grandson, replaced in turn by Said Pasha in 1854. M. de Lesseps now obtained the previously withheld co-operation of the Egyptian government in his scheme of the Suez canal (opened in 1869). Said was succeeded in 1863 by his nephew, Ismail, who, by leave of the sultan, took in 1866 the hereditary title of khedive (q.v.). The same firman made the succession to the throne of Egypt direct from father to son, instead of descending, according to Turkish law, to the eldest heir; and in 1873 the sultan granted to the khedive the right (withdrawn in 1879) of concluding treaties and that of maintaining an army. Darfur was annexed to E. in 1874, and in that and the following year further conquests were made in the south. Through sir Samuel Baker and Gordon Pasha, governor of the Soudan, the khedive has done much to suppress the slave-trade in his dominions. In 1875, the khedive sold to Great Britain 177,000 shares in the Suez canal (q.v.) for £4,000,000. The condition of the Egyptian finances was almost hopelessly involved, when in 1876 the revenue was put under the management of European commissioners. An Egyptian contingent of about 10,000 men, under the command of Prince Hassan, third son of Ismail Pasha, fought for the crescent in the Russo-Turkish war of 1877–78. The new financial system having proved unsuccessful, another commission of inquiry was appointed; and ere long it was announced that the khedive had absolutely accepted the European system of constitutional government, and had made Nubar Pasha head of a reformed administration. The summary dismissal of this ministry in April, 1879, was followed by the interference of the European governments. The khedive, who declined voluntarily to abdicate, was, at the instance of the western powers, deposed by his suzerain the sultan in June, and prince Tewfik, Ismail's eldest son, was proclaimed viceroy of Egypt.

Statistics.—The revenue is about £10,000,000, and rarely suffices to cover the expenditure, which includes an annual tribute of £700,000 to the Porte. The national debt is over £80,000,000; besides, the Khedive's personal debt amounted in 1878 to £8,815,000. In 1877, the total imports of E. had a value of £4,506,000, the exports (chiefly cotton) of £15,500,000. After the Russo-Turkish war, the army of E. was reduced to 15,000. The navy includes two frigates, two corvettes, yachts, and gunboats.

Ancient Civilization.—It now remains to consider the old civilization of the Egyptians, which had made such strides at an early period of their history. In the sciences, as early as the 4th dynasty, the notation of time, the decimal system of numbers, weights, and measures adjusted to a pound of 1400 grains, the geographical division of the country, and the division of the year (of 365 days) into three periods (of four months of 30 days) and twelve months, were already known, while the form of the buildings implies a knowledge of geometry and its sister sciences. An empirical knowledge of astronomy was probably possessed; nor could the arts have reached such a high development without some acquaintance with chemistry; and tradition assigns a knowledge of medicine and anatomy to a still earlier age. The art of literary composition also existed in the 11th dynasty, the fragments of the religious or so-called hermetic books of that age have reached us (see PAPYRUS); and Cheops himself was an author of renown. The language of the period, although concise and obscure, was nevertheless fixed; and a code of manners and morals, under the 6th dynasty, has been handed down. Architecture had attained great refinement at an early period; not only were the chambers and temples, and other edifices, squared and directed to face the cardinal points, but the use of a kind of false arch, or stones disposed so as to form an angle overhead to relieve superincumbent pressure, *en décharge*, was practiced as early as the 4th, and the vault or arch was in existence in the 11th and 18th dynasties, eight centuries before that of the Cloaca Maxima of Rome. Columns were in use as early as the 4th dynasty; and in the 12th, the so-called proto-Doric ones of Benihassan, with their cornices and triglyphs, show that the Greeks derived this order of architecture from Egypt. The symmetric arrangement of the temples, consisting of rectangular court-yards and hypæthral halls of many columns, built before the original shrine, with their gateways, slightly converging to the apex, and their bold and severe lines, and the obelisk (see OBELISK), and the pyramid (see PYRAMID), forms admirably adapted to resist the inroad of time, not to mention the remarkably fine masonry, prove the high development this art had acquired at the remotest age. Nor was sculpture less advanced, for long before Dædalus, the statues of the 4th dynasty, at least 2000 B.C., had been molded with great accuracy to a fixed canon; and although their architectural employment had rendered their action rectilinear—such as the arms pendant, the left foot advanced, and the feet not detached but when in stone, with the part between them reserved—and the ears were placed too high in the head, and a kind of pillar was fixed behind in standing figures, yet in portraiture they had attained to great perfection. Sculpture, indeed, in the human form was always restricted to a few conventional attitudes; but some of the lions and sphinxes are executed with a spirit surpassing the power of Greek artists. A peculiar kind of bas-relief prevailed in E., the figures being sunk below the surface like the intaglio fig-

ures of a gem, but in slightly convex relief, not concave. This style, called cavo-rilievo, or intaglio, has been most successful in preserving the hieroglyphs and anaglyphs of the monuments. Bronze statues cast from molds, and having a leaden or other core, were first made in E., and subsequently introduced into Greece by Rhœcus. This art flourished best under the earlier dynasties, and had much degenerated in the 19th and 20th, although subsequently revived by the 26th. Painting appeared at the same age chiefly in tempera or whitewashed surfaces, although fresco was occasionally used, and encaustic appears only under the Greeks and Romans. This art, of course, was freer than sculpture, but yet had a rigid architectural character, and followed the same canon as sculpture, the colors used being generally the pure or primitive, and the background uniformly white. The architectural details of Egyptian temples and the hieroglyphs appear to have been always colored, and added additional charm to the sculptures. The religious papyri or rituals were also often embellished with elaborately colored vignettes, resembling the illuminations of modern manuscripts. Nor had the Egyptians attained less eminence in the art of music, the harp and flute appearing in use as early as the 4th, and heptachord and pentachord lyres as early as the 12th dynasty; besides which, drums, tambourines, flutes, cymbals, trumpets, and guitars, are seen in the 18th, and the national instrument, the jingling sistrum, in the 4th. Many of the instruments are of great size, and must have produced considerable effect. Nor was the art of song wanting, and measured recitations or songs occur on monuments of the 12th dynasty, while the lays of Maneros traditionally dated to a still earlier period. Poetry, indeed, was at all times in use, and the antithetic genius of the language suggested the application of the strophe and antistrophe (see HIEROGLYPHICS), although it is not possible to define the meter. In the mechanical arts, many inventions had been made: the blow-pipe, used as a bellows, appears in the 5th dynasty; bellows and siphons in the 18th. The saw, the adze, the chisel, press, balance, and lever appear in the 5th, the harpoon in the 12th, razors in the 12th, the plough and other agricultural implements in the 5th. Glass of an opaque kind is seen in the 4th, and dated specimens in the reign of Thothmes III. (1445 B.C.), give the priority to E. (see GLASS); the oldest transparent glass, the Assyrian, not dating older than Sargina (711 B.C.). A glazed pottery or porcelain (see POTTERY), the potter's wheel, and the kiln, appear in the 4th; and the art of metallurgy, with the use of tin, at the same period. In the military art, the Egyptians used at an early age defensive armor of shields, cuirasses of quilted leather, and helmets; while spears, clubs, maces, swords, daggers, bows, and hatchets formed their offensive weapons. For sieges, they employed the testudo, ladders, torches and lanterns, and mines. The army was composed of infantry till the beginning of the 18th dynasty, when war-chariots were introduced; for, prior to that period, the ass only was known and used for transport; and carriages not having been invented, persons and goods were transported, on the panniers of asses, or on a kind of saddle slung between two of these useful animals. War-boats no doubt existed at an early period, and are mentioned as early as the 12th dynasty; but sea-going vessels not till the 18th, and no fleet till the 19th. The Nile, however, was constantly navigated by row-galleys with sails. An extensive commerce was carried on with neighboring nations, and their tribute enriched the country with slaves, cattle, gems, valuable metals, and objects of curiosity. Rare animals were collected for ostentation. Under the earlier dynasties, the chief occupation of the nation appears to have been rearing cattle, cultivating grain, indulging in banquets, fishing, fowling, and the chase, and the establishment of each noble contained in itself all the organization and artificers necessary for its maintenance. How transactions were carried on without the use of money, is not very clear, unless gold circulated molded in the shape of rings adjusted to a given weight, but coin plate is mentioned by its pounds, *mna*, and its ounces, *kat*. The Persians first introduced money. See NUMISMATICS. The wealth of families was, however, spent on the tombs and furniture of the dead, and the preparations for embalming, which were on so vast a scale that filial piety did not disdain to mortgage not only the sepulchers, but the very mummies of its ancestors. See EMBALMING. Amusements were various, from the single-stick and juggling, the dance of almehs, the bull-fight, to draughts, dice, and morris. In fact, ancient Egypt had a material civilization, which exerted all the requirements of industry, and forgot none of idleness. Pleasure was the object of existence, not, however, untempered by the voice of reason or the appeals of conscience, the moral code of duties being as pure as that of contemporary nations.

The civil government was administered by the three upper castes. The priests, distinguished by their superior knowledge, cleanliness, and godliness, had the ecclesiastical; the temples being administered by high priests and an inferior hierarchy, with overseers, and governors of revenues, domains, and donatives. Each temple, like a monastic institution, had its carefully subdivided organization, each denizen having a separate charge or jurisdiction. The political and civil government was administered by royal scribes, or secretaries of state, who attended to the revenue, justice, foreign affairs, and all the interests of the executive. Sacred scribes attended to the ecclesiastic interests, and inferior scribes to the local interests. The public works, the collection of grain, and of the linen dues; the cattle, workmen, wells, irriga-

tion, had each their separate superintendents and scribes. The military force of 410,000 men, at a later period, comprising all arms of the service, was ruled with severe discipline, and under the direction of nomarchs (*ka*), colonels (*hrai*), captains (*mer*), and lieutenants (*atnu*). The criminal and civil law was administered by judges (*satem en ash*), who held traveling assizes, and to whose tribunals the necessary officers were attached. The athlophoros or standard-bearer also transmitted the decrees of the royal chancery. The execution of deeds required so many witnesses that fraud evidently often occurred. The superior position of women in the social scale, notwithstanding the permission to marry within degrees of consanguinity usually forbidden, shows that the Egyptians reached a higher point of delicacy and refinement than either their western or eastern contemporaries. Colossal in its art, profound in its philosophy and religion, and in possession of the knowledge of the arts and sciences, E. exhibits the astonishing phenomenon of an unexpectedly high and ancient civilization. See Bunsen, *Aegyptens-Stelle* (1845–57); Lepsius, *Denkmäler* (1849–74) and other works; Rosellini, *Monumenti dell' Egitto e della Nubia* (1840); Sharpe, *History of Egypt* (1846); Brugsch, *Histoire d'Egypte* (1849; new ed. 1875); Wilkinson, *Manners and Customs of the Egyptians* (1847; new ed. by Birch, 1879); Lane, *Modern Egyptians* (1842); Chabas, *Mélanges Egyptologiques*, (1862–70); M'Coan, *E. as it is* (1877); Jerrold, *Egypt under Ismail Pasha* (1879).

EGYPTIAN ARCHITECTURE. There is no reason to question the originality of Egyptian architecture, and the structures of Egypt are probably the oldest specimens known in the world. It is remarkable for its solidity. The great pyramid, erected by Cheops as a tomb for himself, was built of stones 30 ft. in length, quarried in the Arabian mountains, and conveyed by the Nile to a newly-constructed road ⅘ of a mile long, 60 ft. broad, and in a cutting of 48 feet. This road was of polished stone, elaborately carved, and required 10 years for its completion. The Egyptians attained great proficiency in the mechanical arts. Tney possessed not only the power of polishing and carving granite with great facility, but were able to quarry the hardest stone, and raise huge blocks that would task the ingenuity of modern engineers. Next in importance is the sphinx, on which an inscription has been found which seems to prove that it was sculptured before the time of the first pyramid. The tombs of the Egyptians were in the form of truncated pyramids, and built principally of well-squared stone. The grandest architectural efforts of the Egyptians were displayed in their temples, which were first built about the time Thebes became the capital, or 2000 B.C. They were often used as citadels, as few of the towns were fortified. The temple of Edfoo in Upper Egypt is more perfectly characteristic of the arrangement and style of the national temples than any other. The earliest forms of columnar architecture are found in the rock-cut tombs and temples, the principal being that of the palm-tree column, resembling that tree with only the crown leaves. Burnt or sun-dried bricks, marble, granite, and many other materials were used in the construction of buildings. The roofs were of great masses of stone, requiring the use of interior columns; they were flat, but inclined so as to shed rain. The pyramid was the model for all buildings. Minarets and domes were unknown; rude arches were used in the 16th c. B.C., but huge stones were employed for covering lintels and doors, and the arch was neglected. The oldest houses had walls inclined inward, and were but one story high; they were ventilated by a wind-shaft over two screens, like large fans, bending each way to catch the air and direct it down the shaft into the house. The decorations were principally hieroglyphic and emblematic. In 1836, the authorities of New York planned a new prison, originally selecting a style to represent some of the discoveries made in Yucatan a few years before by the traveler John L. Stephens; but finally they decided upon the Egyptian style, and the result is now seen in the prison edifice on Center street known as "The Tombs"

EGYPTIAN LANGUAGE AND LITERATURE. The origin of the most ancient language of Egypt, the hieroglyphic, is unknown. It can be traced, however, as far back as the 3d dynasty, and the date of its discovery was no doubt much earlier than 3000 B.C. It has some points of affinity with the Semitic languages, while differing widely from them in many particulars. Some of its words appear to be of Indo-European origin, and some writers have even placed it in that family of languages. It had two dialects—those of Upper and Lower Egypt; and from these sprang another, the vulgar dialect, which became the national language just before the adoption of the Coptic. The characters of the ancient language present a very complex system, partly pictorial and symbolic, and partly syllabic and alphabetic. Out of this grew the hieratic or common written form of the language, principally used for documents written on papyrus. The demotic writing is a form of the hieratic employed for legal documents from the 26th dynasty downwards. The oldest demotic papyrus is in the museum at Turin, and dates back to 620 B.C. It was used till the 2d c. of the Christian era, after which there was a gradual transition to the Coptic, which is the exclusive vehicle of Christian Egyptian literature. The language nearly died out in the last c., making way for the Arabic. The chief change in the Coptic was in the introduction of Greek words, especially of the religious class. The Coptic is written with the Greek alphabet, with the addition of six new letters and a ligature, the letters being taken from the

demotic to express sounds not used by the Greek. The ancient Egyptian literature, which scholars during the last fifty years have been laboring to decipher and systematize, has not fulfilled the expectations excited by the discoveries of Champollion. Historically considered it is very unsatisfactory, through lack of system. The religious documents are still less orderly. Of the religious works the most important is the *Book of the Dead*, which is a collection of mythical prayers referring to the future state of the disembodied soul. In spite of the best efforts of De Rougé, a man of the highest critical faculty, to present it to us in its most favorable form, it is greatly confused, marked by poverty of thought. The temple inscriptions are stilted and monotonous, but some of the hymns found in the papyri are of a higher order. The historical writings, so far as they are official, are in the worst style of panegyric. Some of the letters present a lively portrayal of the manners of the people. Champollion and his followers have done the world a valuable service in unfolding the mysteries of the ancient Egyptian writings. Though the disclosures thus far made are less important than was anticipated and there are still many perplexing problems to be solved, the fault is not theirs. It is impossible to see any evidence of a chronological development of Egyptian literature, its characteristics being the same in all periods. The religion of Egypt has been generally regarded as polytheistic, but De Rougé thinks it rested upon a monotheistic foundation, the religious writing speaking of one supreme being, self-existent, self-producing, the creator of heaven and earth. Polytheism, whether or not the earliest form of belief, probably held its ground with monotheism. The literature seems to present a mixture of both. The many deities may have been held subordinate to the one supreme and self-existent being, but this was a low form of monotheism, though it may have been a step upward from thorough polytheism. Works of fiction or amusement prevailed in the time of Rameses, and historical accounts during the reigns of the Ptolemies; while homilies, rituals, and other Christian literature entered the country during the Coptic period. Of the magical literature there are many specimens, in which are recorded the conflicts between the good and evil powers, and the incantations, injunctions, and threats of the conjurers. The medical papyri make it probable that the Egyptians had a science of medicine long previous to 3000 B.C. The earlier practice appears to have been rational, without any superstitious intermixtures. Their remedies embraced the milk of animals, honey, salt, vinegar, etc., the application of raw flesh, ammonia, lard, and prescriptions of draughts, unguents, and injections. The later documents are of an inferior kind, containing much magic and incantation. The scientific treatises are of more value, showing that the Egyptians were acquainted with the true motion of the planets, the earth included. They also had an understanding of geometry. Prominent among the ancient epics is that of Pentaur, which has been called the Egyptian Iliad and is several centuries older than the Greek. A translation of it by prof. Goodwin will be found in *The Cambridge Essays*. The satirical writings do not even spare the sacred person of the king. Of judicial documents many have been discovered.

EGYPTIAN VULTURE, *Neophron percnopterus*, one of the smaller *vulturidæ*, of a genus differing from the true vultures in the slender bill, which is covered for more than half its length with a naked cere, and sharply hooked at the point. The head and throat are naked, but feathers extend along the back of the neck to the crown. The E. V. is not much larger than a raven. The plumage of the male is white, except the great quill-feathers, which are black. This bird is plentiful in Egypt, where it renders important service—as also in Turkey, Syria, and other countries—in devouring and so cleansing away carrion from the vicinity of human abodes. It is constantly to be seen in the streets of towns, and seems to be aware that it is regarded with favor, and enjoys the protection of mankind. Europeans in Egypt often call it Pharaoh's hen, or Pharaoh's chicken. It follows caravans in the desert, to devour whatever dies. Numbers are often seen congregrated together, but the E. V. is not truly gregarious, and lives generally in pairs. Its geographic range extends over the whole of Africa, and great part of Asia; it is common in many parts of the s. of Europe, is an inhabitant of the Alps and the Pyrenees, sometimes visits more northern regions, and has been killed in England.

EHNINGEN, a t. of Würtemberg, situated 21 m. s.s.e. of Stuttgart, is the rendezvous of a great number of peddlers who traverse the neighboring districts for the purpose of dispensing of their wares. Pop. about 5,000.

EHNINGER, JOHN WHETTON, b. N. Y., 1827; a graduate of Columbia college, and pupil of Couture, the French painter. Among his works are "Portrait of Peter Stuyvesant;" a study from Irving's "Knickerbocker's History of New York;" "Love me, Love my Horse;" "The Sword;" "The Foray;" "Lady Jane Grey;" etchings for Hood's "Bridge of Sighs;" for Longfellow's "Miles Standish;" etc.

EH'RENBERG, CHRISTIAN GOTTFRIED, one of the most distinguished naturalists of Germany, was b. April 19th, 1795, at Delitsch, in Prussian Saxony. Although he had been originally intended for the clerical profession, he early relinquished the study of theology in favor of medicine; and after having attended the classes at the medical faculty at Leipsic for two years, he removed in 1817 to Berlin, where he graduated in medicine in 1818. His favorite study at this period was botany, and his earliest publica-

tions are devoted to botanical subjects, and more especially to such as demand the use of the microscope—an instrument with which the name and reputation of E. must ever remain inseparably associated; for to him belongs the merit of having rescued it from the discredit into which it had fallen, and of having been one of the first fully to appreciate its capabilities. In 1820, E. accompanied his friend Hemprich on his travels to the east; and after having visited Egypt, Syria, and Arabia, returned, in 1826, to Berlin, where he was appointed to one of the medical chairs of the university, which he occupied until his death. The three years which intervened before he again set forth on a scientific expedition, were devoted to the arrangement and classification of some of the abundant materials which he had accumulated in his eastern travels; and to this period belong the composition of his *Akalephen des Rothen Meeres*—which has largely contributed towards our knowledge of the medusæ—and his *Symbolæ Physicæ*. In 1829, E. accompanied G. Rose and A. von Humboldt on an expedition to the Ural and Altai mountains, in the course of which he collected materials for his numerous memoirs on the Infusoria, and for his great work *Infusionsthierchen*, published at Leipsic in 1838, which have identified his name with the history and study of this department of animal life. E. divided the infusoria into rotatoria (now found to belong to higher orders of animal life) and polygastrica, which correspond more nearly with the infusoria as now admitted, although many of his polygastric organisms have been found to be vegetable structures, and some to be the larval forms of worms, etc. E.'s researches have not been confined to living organisms, but include fossil infusoria; and his great work, *Mikrologie*, on the application of the microscope to geology, contains the results of his investigation in this department of inquiry. E. was a member of most of the scientific bodies of Europe, and was for nearly fifty years an active contributor to the scientific literature of his country. He died Sept., 1876.

EHRENBREITSTEIN (Honor's Broad Stone), a t. and fortress of Rhenish Prussia, is picturesquely situated on the right bank of the Rhine, directly opposite Coblenz, with which it is connected by a bridge of boats. The town of E. has several mills, a tobacco-manufactory, a flourishing trade in wine, corn, and iron, two cattle-markets, and four annual fairs. Pop. '71, 4,657. The fortress of E. occupies the summit of a precipitous rock 490 ft. high, and has been called the Gibraltar of the Rhine, on account of its great natural strength and its superior works. On three sides the fortress is so precipitous as to be perfectly inaccessible; on the fourth and only approachable side, the n. w., it is fortified by three successive lines of defenses, one within another. It is defended by 400 pieces of cannon; has cisterns capacious enough to hold a supply of water for three years, and a well sunk 400 ft. deep in the rock, and having communication with the Rhine. E. was besieged in vain by the French in 1688, but fell into their hands in 1799, after a siege of 14 months. Two years after, the French, on leaving E., at the peace of Luneville, blew up the works. It was assigned, however, to Prussia by the Congress of Vienna in 1814, and under that country was restored and thoroughly fortified. It is now one of the strongest forts in Europe. It is capable of accommodating a garrison of 14,000 men, and provisions for 8,000 men for 10 years can be stowed in its vast magazines. The view from the fortress, which comprehends a considerable portion of the course of the Rhine, including its confluence with the Moselle, is picturesque in the highest degree.

EI'BENSTOCK, a t. of the kingdom of Saxony, in the circle of Zwickau, and 16 m. s.s.e. from Zwickau. It stands in a high and bleak district. It has extensive manufactures of chemical products, muslins, lace, tobacco, and tinware, and a considerable trade in cattle. Medicinal plants are very extensively cultivated. Pop. '75, 6,773.

EICHBERG, JULIUS; b. Germany, 1825; educated in the conservatory at Brussels; musical director in Germany and Switzerland. In 1856, he established a musical conservatory in Boston, Mass., where he was for several years teacher of music in the public schools. He has written *The Doctor of Alcantara; The Rose of Tyrol;* and other operas.

EICH'HORN, JOHANN GOTTFRIED, one of the most distinguished scholars produced by Germany, was born at Dörinzimmern, in the principality of Hohenlohe-Oehringen, in 1752, and studied at Göttingen. He first became rector of the school of Ohrdruff, in the duchy of Gotha, afterwards, in 1775, professor of oriental languages in the university of Jena, and in 1788 removed to Göttingen in the like capacity. Of this university he continued a distinguished ornament till his death in 1827.

His scholarship was almost universal, and he has left numerous treatises on a multitude of subjects, both ancient and modern, classical and oriental, but he is chiefly known in this country as a Biblical critic, and a chief of what is called the rational school. E. examined the Scriptures from an anti-supernatural point of view, but applied to their elucidation and criticism an unrivaled knowledge of oriental and Biblical antiquities. Miraculous appearances recorded in the Bible are held by him to be explainable as natural events, and everything is to be brought to the test of reason. Rationalism in this form can hardly be said to exist now, even in Germany; but some of E.'s views as to the historical origin of the canonical gospels have been extensively adopted. His chief works on this subject are a Universal Library of Biblical Literature (*Allgemeine Bibliothek der Biblischen Literatur*, 10 vols., Leip. 1787–1801); an Intro-

duction to the Old Testament (*Einleitung in das Alte Testament*, 4th ed. 5 vols., Gött. 1824); an Introduction to the New Testament (*Einleitung in das Neue Testament*, 5 vols., Gött. 1824–27); and an Introduction to the Apocryphal Writings of the Old Testament (*Einleitung in die Apokryphischen Schriften des Alten Testaments*, Gött., 1798). In a work entitled Primitive History (*Urgeschichte*, 2 vols., Nürnb. 1790–93), he subjects the Pentateuch to bold criticism. His last work was a History of the House of Guelf, which he traces back to the 5th c. (*Urgeschichte des Hauses Welfen*, Han. 1817).

EICH'STADT (earlier AICHSTÄDT, Lat. *Aureatum*, *Arborfelix*, or *Dryopolis*, the last signifying the same as Aichstädt—viz., Oak-town), a t. of Bavaria, is situated in a deep valley on the left bank of the Altmühl, about 40 m. w.s.w. of Regensburg, in lat. 48° 53′ n., long. 11° 11′ east. It consists of the town proper, with four suburbs, is well built, and has several fine squares, one of which is adorned with a fountain and a statue of St. Wilibald, the first bishop of Eichstadt. Among the notable buildings are the palace of the duke of Leuchtenberg, containing a museum of antiquities and some good portraits; the cathedral, founded in 1259, an imposing Gothic structure, with monuments in bronze and marble, good paintings, and fine painted glass; the town-house (1444), with a square tower; and the Wilibaldsburg, or castle of St. Wilibald, built on an eminence 1200 ft. high, and lately used as a barracks. The manufactures are woolen and cotton fabrics, ironmongery, and stoneware; there are also breweries, and several mills. Pop. '75, 7,136. E. is of Roman origin, and in 908 was surrounded by walls. The bishopric of E. was founded as early as 745. E. came into the possession of Bavaria in 1805. In 1811, Eichstadt, along with the landgraviate of Leuchtenberg, was bestowed upon Eugene Beauharnais, duke of Leuchtenberg, but reverted to Bavaria in 1853.

EICHWALD, EDUARD, a Russian naturalist, was b. at Mitau, in Russia, 4th July, 1795, and studied the physical sciences and medicine at Berlin, 1814–17. After spending some years in travel, he returned to Russia, and in 1823 was appointed professor of zoology and midwifery at Kasan. In 1827, he accepted a call to Wilna as professor of zoology and comparative anatomy; and in 1838 he went to St. Petersburg as professor of mineralogy and zoology. E. has been a great traveler for scientific purposes. He has investigated the shores of the Caspian sea, the Caucasus, Persia, Germany, Switzerland, and France, traveled over the greater part of Russia, including the Scandinavian provinces, and in 1840 made a geological journey through Italy, Sicily, and Algeria. He has unquestionably been of more service to Russia by his geognostic, botanical, and zoological researches than any man since Pallas. His principal writings are *Zoologia Specialis* (Wilna, 1829–31), *Plantarum Novarum quas in Itinere Caspio-Caucas observavit, Fasciculi* (Wilna and Leip. 1831–33), *Travels to the Caspian Sea and the Caucasus* (Stuttg. (1834–37), *Memoir on the Mineral Riches of the Western Provinces of Russia* (Wilna, 1835), *Palæozoic Russia* (1840), and in 1851, *The Palæontology of Russia* (St. Petersburg, 1851). E. is a member of all the Russian, and of many foreign academies and learned societies.

EIDER, a river of n. Germany, forming the boundary-line between Schleswig on the n., and Holstein on the south. It rises 12 m. s.w. of Kiel, flows first n.w., then in a general westward direction, though with many windings, and enters the North sea at Tönning, after a course of about 90 miles. It is navigable as far as Rendsburg, from which town the Schleswig-Holstein canal stretches e. to Kiel fiord, on the shore of the Baltic, thus establishing water-communication between the North and Baltic seas.

EI'DER, or EI'DER-DUCK (*somateria*), a genus of oceanic ducks, having the hind-toe furnished with a deep lobe, and the bill swollen and elevated at the base, and extending up the forehead, where it is divided down the middle by an elongated projection of feathers. The tertials are elongated, and fall down over the wing. This genus is further characterized by the very abundant development of a fine elastic gray down, particularly on the breast, the valuable *eider-down* of commerce.—The COMMON E. (*S. mollissima*) is intermediate in size between a common duck and a goose; not much exceeding the common duck in entire length, because of the comparative shortness of the neck, characteristic of the oceanic ducks, but being about twice its weight. The male is larger than the female; and in the breeding season, has the under parts black, the upper parts and the neck white, the crown of the head velvety black, the cheeks greenish white. After the breeding season, the white color almost disappears from the upper parts, and gives place to black, without change of feathers. The female is of a pale-brown color, tinged with red, and varied with transverse marks of dark brown. Young males at first resemble the females, and do not acquire the full adult plumage till their third winter. The young are termed brattocks in many parts of Scotland. The E. is an inhabitant of the northern parts of the world, abounding on arctic and subarctic shores, and becoming rarer in more southern and temperate regions. It is merely an occasional winter visitant in the middle latitudes of Europe, and the Fern islands are its most southern breeding-place on the British coast. In North America it seldom breeds further s. than the bay of Fundy. Great numbers breed on the coasts of Labrador and more northern parts of America, where hitherto the gathering of the down has been generally neglected; but in Iceland and Norway the breeding-grounds of eiders are carefully protected, and are transmitted as valuable inheritances from father to son. Cattle are sometimes removed from islets, in order to induce the eiders

to settle upon them, and a strict watch is kept against dogs and foxes. Promontories are sometimes even formed into artificial islets, on the same account, as the E., like many other sea-birds, prefers islands for its breeding-places, probably on account of their greater quiet and security. The nest is formed of fine sea-weeds, mosses, and dry twigs, if they are to be had, matted and interlaced. The eggs are usually five, sometimes six or seven in number, about 3 in. long, and fully 2 in. broad, of a uniform pale green: they are at first deposited without any down, but as incubation proceeds, the mother strips the down from her breast, and places it about them. By it they are kept warm when she at any time has occasion to leave them, but it seems to be indispensable to their being hatched; for if the eggs and down are removed, and if this is done a second time, so that the female cannot afford a further supply, the male comes and contributes for the third set of eggs the down of his breast, which is of a paler color. The common practice in Norway and Iceland is to take away the eggs and down twice, leaving the third set of eggs to increase the number of the species. The eiders of the Icelandic and Norwegian breeding grounds show so little alarm at the approach of visitors that the females will permit themselves to be touched as they sit on their nests, the males moving about close beside them, but agitated and disturbed. The nests are often placed so close together that great care is necessary in walking among them to avoid trampling upon them. In the islet of Vidöe, a valuable breeding ground near Reikiavik, the capital of Iceland, almost every little hollow place between the rocks is occupied by the nests of these fowls; they readily take possession of holes cut for them in rows in the sloping side of a hill; nay, garden-walls and the interiors of buildings are in like manner occupied. In Orkney and Shetland the E. is commonly known by the name of dunter-duck.

The E. is sometimes called ST. CUTHBERT'S DUCK, from a rock called St. Cuthbert's isle, one of the Fern islands. It seems probable that, with due care, the number of the eiders at the Fern islands, and some of the Scottish islands, might be greatly increased, and their down yield a considerable revenue; but at present their eggs are indiscriminately taken with those of other sea-birds, and no protection is extended to them. The eggs are remarkably fine. The flesh of the birds, also, is not unpleasant, and is said to become of superior excellence when they are partially domesticated, and when farinaceous food is mixed in considerable quantity with their natural diet of marine mollusks, crustaceans, etc. The complete domestication of the E. has been successfully attempted, where access could be obtained to the sea.

About half a pound of eider-down is said to be annually obtained from each nest, but this is reduced by cleaning to a quarter of a pound. The elasticity of the down is such that three quarters of an ounce of it will fill a large hat, although two or three pounds of it may be pressed into a ball and held in the hand. Its extensive use, particularly in Germany and other parts of the continent of Europe, for stuffing the bed-coverings, which there usually supply the place of blankets, etc., is well known. The down taken from birds which have been killed is inferior in quality to that obtained from the nests. The latter is known in commerce as *live down*, the former as *dead down*.

The KING EIDER, or KING DUCK (*S. spectabilis*), also yields no inconsiderable part of the eider-down of commerce, especially of that which is brought from the Danish settlements in Greenland. This bird belongs to still higher northern latitudes than the common eider. On some parts of the coasts of Greenland, on those of Spitzbergen, Nova Zembla, the North Georgian islands, etc., it occurs in great numbers. A few breed in Iceland and the Faröe islands. In Britain, the bird is a rare visitant. It is of about the same size as the common eider The female is very similar to the female of that species; but the male has a remarkable large protuberance over the base of the upper mandible, and the white color of the neck extends only over the upper part of the back. Skins of king ducks are made into winter garments by the inhabitants of Siberia and Kamtcha'ka.

EIGHT, PIECE OF, a name once popularly given to the Spanish dollar, as being divided into 8 reals.

EIGHT-FOIL, used in heraldry to signify a grass having eight leaves, as the trefoil has three. According to Sylvanus Morgan, it may be used as the difference of the ninth branch of a family.

EIGHT-HOUR LAW, an act adopted by the U. S. congress in 1868, and subsequently by the legislatures of a number of the states, providing that in all government employment eight hours shall constitute a day's work. It was expected that this would have an influence on the practice in private employment. However desirable this result, the expectation has as yet been realized in only a small degree, as the labor-market seems to develop its own laws in its own time and way.

EIK, in the legal phraseology of Scotland, is an addition made to a document for the purpose of meeting circumstances which have subsequently arisen. Thus, a reversion being a deed granted by a borrower, who reserves to himself the right of redeeming land which he has conveyed in security to the lender (see WADSET), an E. to a reversion is a subsequent deed by the reverser acknowledging the receipt of a further sum, and declaring that the property shall not be redeemable until repayment of the addi-

tional loan. In like manner, an E. to a confirmation or testament is an addition to the inventory made up by an executor at his confirmation, in consequence of additional effects belonging to the deceased having been discovered. Where the executor appears to have fraudulently omitted or undervalued any effects belonging to the deceased, any creditor or person interested may apply to the commissary to be confirmed executor with reference to these additional effects, *ad omissa vel male appretiata*.

EI'KON BASILIKĒ, a work presumed to have been written by Charles I. during his confinement, but now more correctly imputed to another writer. The following are the explanations of M. Guizot on the subject, in his *History of Oliver Cromwell and the English Commonwealth:* "It is to the *Eikon Basilikè* that Charles I. is principally indebted for the name of the royal martyr. The work is not by him; external testimony and internal evidence both combine to remove all doubt on the matter. Dr. Gauden, bishop, first of Exeter and afterwards of Worcester, under the reign of Charles II., was its real author; but the manuscript had probably been perused and approved, perhaps even corrected, by Charles himself during his residence in the Isle of Wight. In any case, it was the real expression and true portraiture of his position, character, and mind, as they had been formed by misfortune; it is remarkable for an elevation of thought which is at once natural and strained; a constant mingling of blind royal pride and sincere Christian humility; heart-impulses struggling against habits of obstinate self-consciousness; true piety in the midst of misguided conduct; invincible, though somewhat inert devotion to his faith, his honor, and his rank; and as all these sentiments are expressed in monotonous language, which, though often emphatic, is always grave, tranquil, and even unctuous, with serenity and sadness, it is not surprising that such a work should have profoundly affected all royalist hearts, and easily persuaded them that it was the king himself who addressed them."—Vol i. p. 31.

EILDON HILLS, three peaks in Roxburghshire, Scotland, near the romantic village of Melrose, commanding a view of the splendid scenery of the region. The story is that the renowned wizard, Michael Scot, found but one mountain there but divided it into three peaks. None of them are over 1400 ft. in height.

EI'LENBURG, a t. of Prussian Saxony, is situated on an island of the river Mulde, 26 m. e.n.e. of Merseburg. It is reached by two bridges, is surrounded by walls and ditches, and consists of the town proper with four suburbs. The manufactures of E. consist of calico, woolen yarn, tobacco, chemicals, beer, and agricultural implements. Pop. '75, 10,312.

EILETHYIA, a city of Egypt, anciently Nuben, and known at present by the name of El Kab. The town was anciently walled. The present ruins consist of the remains of small temples dedicated by Rameses II. to Ra; a Ptolemaic temple dedicated to the Eponymous goddess by Physcon or Energetes II., with additions by Ptolemy Alexander I., and Cleopatra; and another temple dedicated by Amenophis III. to the local deities. The names of other monarchs are also found in the ruins; but the most interesting and important remains are the rock-tombs excavated in the vicinity. That of Aahmes-Pensuben, a functionary, records his military services in the wars of the early monarchs of the 18th dynasty against the Shos or shepherds, and other Asiatic and Nigritic races. Another, of Pahri, is decorated with paintings representing the pursuits of agriculture. Swine were sacred to the local goddess. The town itself, during the 18th dynasty, appears to have been governed by princes, and some of the tombs appear as late as the 19th and 20th dynasties.—Wilkinson, *Modern Egypt*, vol. ii. p. 270; Champollion, *Notice Descriptive*, p. 265; Brugsch, *Reiseberichte aus Aegypten*, p. 214.

EIMBECK, or EINBECK, an old t. of Hanover, is situated on the Ilme, 40 m. s.s.e. from Hanover, in lat. 51° 49′ n., long. 9° 50′ east. It was a place of considerable importance in the 15th c., and was a Hanse city, but has decayed greatly in recent times. The minster is large and beautiful. The houses of E. are antiquated; its streets narrow, tortuous, and badly paved. One portion of the town, however, which was burned down in 1826, has been rebuilt in a greatly improved manner. E. has manufactures of woolens, cottons, and linens, and chemical products; and has distilleries, breweries, tanneries, and tobacco factories. E. owes its origin to the pilgrimages made to the chapel of the Holy Blood, founded here in 1094 by count Alexander von Darni. Pop. '75, 6,384.

EIMEO, one of the Society islands, in the Pacific ocean, lies in lat. 17° 30′ s., and long. 150° 10′ w., about 30 m. to the w.n.w. of Tahiti, the principal member of the group. It measures 9 m. by 5, and numbers about 1300 inhabitants. It consists of deep valleys and abrupt hills—the former well cultivated, and the latter heavily timbered. It is worthy of notice chiefly as the cradle of Polynesian Christianity. Here, in or about 1814, occurred the first popular manifestation in favor of the new religion; and here was established, as an instrument of evangelization, the South Sea college of the London missionary society.

EINSIEDELN, a small t. of Switzerland, in the canton of Schwytz, and 9 m. n.n.e. of the town of that name. It is worthy of mention on account of its Benedictine abbey, containing a black image of the Virgin, to which about 150,000 pilgrims annually repair. The town has 55 inns and 20 alehouses, supported chiefly by the pilgrims. The dedication

festival of the abbey, 14th Sept., is the great pilgrimage season. The present abbey, one of the finest in Switzerland, was built at the beginning of the 18th c., and is the fifth since the foundation of the abbey, in the 10th century. Its treasury was rifled by the French in 1798. Pop. '70, 7,633.

EIRE, EYRE, JUSTICES IN (corruption of Lat. *in itinere*). By this term, both in England and Scotland, were the judges of assize (q.v.) formerly designated. Justices in eire were first established in England by the statute of Northampton (1176 A.D.), in the reign of Henry II. At first, they made the circuit of the kingdom once in seven years; but by Magna Charta, c. 12, the chief justices are directed to send justices through every county once in the year. In Scotland, the chief justiciar, says Erskine, i. 3, s. 25, was originally bound to hold yearly two justice courts or aires at Edinburgh and Peebles. This court gradually became fixed at Edinburgh. Besides this court, special "justice aires" were frequently held in the more remote parts of the country by the king in person, or by judges named by him, twice in the year, in spring and autumn (st. Robert III. c. 30, 1440 c. 5, 1491 c. 29). These courts were discontinued, but revived by 1587, c. 81. The term is still in use in Scotland, where, at the commencement of every circuit, proclamation is made to the lieges to attend the "circuit eire."

EI'SENACH, a t. of Germany, Saxe Weimar, is beautifully situated amid finely wooded hills on the Hörsel, 45 m. w. from Weimar. Once the capital of a principality to which it gave name, E. is still a prosperous and industrious town, and is well built, with wide, clean, and well-paved streets. E. has a ducal palace, a large and handsome building, now used as a court-house; a spacious market-place, including a handsome civic school; numerous churches; and a school of design. Its manufactures are woolen, cotton, and linen goods, soap, white lead, meerschaum pipe-bowls, leather, and carpets; there are also breweries and tanneries, and oil, powder, and spinning mills. Pop. '75, 16,193.

On a lofty eminence in the immediate vicinity, surrounded by forests, stands the castle of Wartburg, now used as a prison, but formerly a residence of the landgraves of Thuringia, and worthy of notice as the spot where the Minnesingers (q.v.) assembled to hold a trial of skill in 1207, but chiefly as being the asylum to which Luther, at a time of great danger, was carried by his friend the elector of Saxony, who, waylaying the great reformer, seized him, with an appearance of violence, and hurried him to this fastness, where he remained in safety from May, 1521, to Mar., 1522. The chapel in which Luther preached, as well as the chamber which he inhabited, and in which he discomfited the evil one by throwing the inkstand at his head, is still pointed out. Another portion of the castle contains a fine armory, with suits of the 16th and 17th, and even, it is said, of the 13th and 14th centuries.

EI'SENBERG (Ger., Iron Mountain), a small t. of Germany, in the duchy of Saxe-Altenburg, is situated on an eminence near the Saale, 26 m. e. of Weimar. It is well built, its chief edifices being the castle, the observatory, the lyceum, and the town-house. E. has manufactures of woolens, porcelain, and eathen ware, and has five annual fairs. Pop. '71, 5,261.

EI'SENBURG, or VAS VARMEGYE, a co. in w. Hungary, on the border of Styria; 1782 sq.m.; pop. '70, 331,602. It is mountainous, fertile, and well watered. The productions are coal, mineral waters, quicksilver, corn, wine, fruit, and tobacco. Chief town, Szembathely, or Stein-am-Anger.

EISENERZ, a small t. of Austria, in the n. of the province of Styria, 20 m. w.n.w. of Bruck. Its appearance is dirty and unprepossessing, and it is worthy of mention only for its connection with the Erzberg (ore mountain), at the southern base of which the town lies. This mountain, which is about 2,840 ft. high, and about 5 m. in circumference at the base, is literally a solid mass of iron ore, of a quality so rich, that, instead of cutting mines into it and following the metal in veins—which process was formerly adopted here—the top and sides of the rock are quarried from the outside, and the ore is then broken small, and conveyed to the smelting-house without further preparation. Mines have been worked on this mountain for upwards of 1000 years. Arragonite (*eisenblüte*, or *flos ferri*), resembling branching coral in form, and of the most beautiful and purest white, is found in grottoes in the interior of the mountain. Nowhere else does it occur in equal perfection. Pop. '69, 3,841, employed in mining. In 1872, 2,044,820 centner, or about 125,000 tons, of pig-iron were produced.

EISENSTADT, a free t. of e. Hungary, stands in lat. 47° 50' n., and long. 16° 30' e., 12 m. n.n.w. of Oedenburg. It is a walled town, has two gates, and consists principally of three main streets. It has also a Franciscan monastery, containing the burial-vault of the Esterhazy family, who are the proprietors of the palace, which forms the chief architectural feature of Eisenstadt. This palace was built in 1683, but was altered and enlarged in 1805. It contains 200 chambers for guests, and has a saloon sufficiently large to dine 1000 people. Its library contains a magnificent collection of church-music—masses, litanies, oratorios, etc., with some of Handel's MSS. In the suburbs is a conservatory, one of the largest in Europe, containing 70,000 specimens of exotic plants. Pop. '69, 2,476.

EISLE'BEN, a t. of Prussian Saxony, is situated about 20 m. w. of Halle E., once capital of the counts of Mansfeld, is the center of a rich mining district, and consists of old town, new town, and suburbs. E. makes large quantities of beer, and has manufactories of potash and tobacco; in the vicinity are copper and silver mines, producing yearly about 1,000 tons of copper, and 25 tons of silver. Pop. '75, 14,578. Here, on Nov. 10, 1483, Luther was born, and here also he died, Feb. 16, 1546. The house in which he was born was partially consumed by fire in 1689 An interesting remnant of it, however, is still extant, having the portrait of Luther placed over the entrance. In the church of St. Andrew are the cap, cloak, and other relics of the great reformer.

EISTEDDFODS, the name given to the gathering of Welsh bards for competition in national minstrelsy. See BARD, and WELSH LANGUAGE AND LITERATURE,

EJECTMENT, ACTION OF (*ejectio firmæ*), in English law, "is a possessory action, wherein the title to lands and tenements may be tried, and the possession recovered, in all cases where the party claiming title has a right of entry."—Selwyn's *Nisi Prius.* "The action of ejectment," says lord Mansfield, "is the creature of Westminster hall, introduced within time of memory, and molded gradually into a course of practice by rules of the courts."—*Fairclaim & Fowler* v. *Shamtitle,* 3 Burr. 1292. According to the strict rules of common law, a person dispossessed of his property in land, etc., was obliged to enforce his right by means of one of the forms of real action (q.v.) now abolished. But as the form of action differed according to the nature of the possession of the holder of the land, this process was tedious and inconvenient. In order to remedy this defect, the action of ejectment was by degrees adopted as a means of establishing a title to land. This action was at first applicable to the special case where the plaintiff was lessee for years, and it was limited originally to a demand for damages simply But it is said that as early as the reign of Richard II. or Edward IV., the court gave judgment that the plaintiff should also recover the term and the possession of the land. The action having thus acquired in some measure the character of a real action, it was found convenient to extend its effect. By means of a legal fiction, introduced in the time of Henry VII., the action was first applied to the purpose of enforcing a title to land. The process adopted was as follows. The judges having declared that a tenant for years succeeding in his action should have possession, the claimant of the land commenced by feigning a lease for years granted by himself to an imaginary lessee, John Doe. It would seem that at first the plaintiff actually granted a formal lease to a friend, who was also formally ousted, in order to raise the question of title. But these men of straw being removed as the cause proceeded, it was soon found that they might be altogether dispensed with, and the fictitious John Doe and Richard Roe substituted in their room. The declaration proceeded to state that upon this lease Doe entered, and that Richard Roe, also an imaginary person, had ousted him. Notice of this action was then given to the actual tenant of the lands, together with a letter from the imaginary Richard Roe stating that he should make no appearance to the action, and warning the tenant to defend his own interest. If no appearance was made, judgment was given in favor of the plaintiff, who thereupon became entitled to turn out the tenant in possession. But if the latter made appearance, the first step in the action was a formal acknowldgement by him of his possession of the lands, of the lease in favor of Doe, of Doe's entry, and of the ouster by the tenant himself. These matters, be it remembered, were, in fact, mere fictions; but having been introduced on the record simply to comply with the technical rules of legal title, they were equally readily removed when the real question at issue presented itself. This reduced the cause to the simple question of the right of the plaintiff to grant the lease to Doe, and thus the title to the land became the real question at issue. But it must be observed that this remedy was confined to the case of one having a right of entry (q.v.). Where, therefore, a person had suffered a deforcement or discontinuance (q.v.), he was still obliged to resort to a real action to establish his right. This state of things continued till 3 and 4 Will. IV. c. 27, whereby the remedy by ejectment was, with a few exceptions, in fact extended to every one who alleged that he was wrongfully dispossessed; but it was at the same time provided that no action should be brought to recover land but within twenty years after the right accrued. But while the remedy was thus extended, the same elaborate string of fictions was suffered to continue until the passing of the common law procedure act (15 and 16 Vict. c. 76), whereby the ancient machinery is quite swept away. The action now commences by a simple writ addressed to the tenant in possession, and "to all persons entitled to defend the possession," setting forth that the plaintiff has asserted a claim to the land, and calling upon those interested to appear within a certain time to defend their right. The writ also contains a notice that, in default of appearance, the tenant in possession will be ejected. On appearance being made, issue is joined, and the cause proceeds as in ordinary actions. Judgment in ejectment will not carry the mesne profits or rents. In some cases of forcible entry, justices of the peace can also summarily eject the intruder and give possession.

EJECTMENT, ACTION OF (*ante*). In the state of New York, as early as 1830, actions for ejectment were placed upon substantially the same ground as that established in England in 1852 by the act 15 and 16 Vict. c. 76. If the plaintiff succeed in his action upon this

ground, he has cause for another action to recover for the loss sustained by the defendant's wrongful possession. This is called an action of trespass for intermediate profits. In some states the two causes of action may be joined in one.

EJOO. See GOMUTO.

EJUT'LA, a t. of Mexico, in the province of Oajaca, on a small river, 250 m. s.s.e. of Mexico city. It was the capital of a department of the same name, in the new division of the country made by Maximilian. Pop. 7,128.

EKATERINBURG', a fortified t. of Russia, in the province of Perm, is situated on the eastern slope of the Ural mountains, on both banks of the Isset, in lat. 56° 50′ n., long. 60° 7′ east. It is a well-built town, its streets long and straight, but unpaved. As a substitute, however, planks are laid along the sides of the streets, and used as footpaths. The majority of the houses are of wood, but there are also many very handsome stone buildings. In the southern portion of the town, which is connected with the northern by a fine bridge, are the government magazines, the mills, factories, and the market-place. The opposite side, however, is the handsomer. It contains the dwellings of the mine proprietors and of the merchants, and is laid out in elegant and spacious streets. E. is the seat of administration for the Ural mines, and is in the center of the mining districts of these mountains. Among its institutions, it has a museum of mineralogy, an excellent chemical laboratory, a school for educating miners, an imperial mint, numerous works for cleansing and amalgamating metals, and for cutting and polishing precious stones. The greater number of the inhabitants are supported by the productiveness of the neighboring mines. E. stands on the high-road between Russia and Siberia, and is therefore a place of brisk trade. In the vicinity are the gold mines of Niviansk and Beresoff. Pop. '67, 24,508. E. was founded by Peter the great in 1723. Its average temperature during the year is 31° 9′.

EKATERINODAR', a t. of Russia, and capital of the country of the Cossacks of the Black sea, is situated on the right bank of the river Kuban, about 100 m. from its mouth, in lat 45° 5′ n., long. 39° east. It is surrounded on all sides by swamp and morass. Its houses are almost all of earth, have thatched roofs, and are of one story in height. The streets are broad, regular, and straight, but exceedingly dirty. E. has a cathedral with six wooden towers, and a wooden fortress. Pop. '67, 8,753.

EKATERINOGRAD', a t and fortress in the s. of Russia, in the government of Caucasus, is situated on the left bank of the Terek, in lat. 43° 40′ n., and long. 44° 3′ east. It is an important military post of the Cossacks; its houses are regular, but miserably built. A stone triumphal arch was erected at E. by Catharine II., in memory of prince Potemkin, who founded the town in 1777. Pheasants abound here, and form a principal article of food. Pop. about 3,000.

EKATERINOSLAV', a government of Russia, in the province of South Russia, bounded on the n. by Little Russia, and on the s. reaching in one part to the shores of the sea of Azov. The government of E., together with that isolated portion of it which lies on the eastern border of the sea of Azov, and comprises the district of Taganrog and the country of the Azovian Cossacks, has, in all, an area of 26,050 sq.m., and in 1870, had 1,852,300 inhabitants. Only about one third of the entire area consists of cultivable land, the remainder being desert (see STEPPE). The climate is mild, and a great many highly esteemed fruits, as apricots, peaches, cherries, etc., which do not occur in the more northern parts of Russia, are found here. E. possesses deep and extensive beds of coal. Though, in 1870, not more than fifty tons were raised, the quantity had within three or four years increased to many thousand tons annually.

EKATERINOSLAV, a fortified t. of South Russia, is situated on the right bank of the Dnieper, 250 m. n.e. from Odessa, in lat. 48° 27′ n., long. 35° 5′ east. It was founded in 1787 by the empress Catharine II. The streets are long and broad, but not so clean or so well filled with houses as they might be. E. has manufactures of silk and woolen goods, and an important annual wool-fair. It is the residence of an archbishop. In the vicinity is a palace, now in a ruinous condition, formerly the residence of prince Potemkin. Pop '67, 22,548.

EKHMIM', or AKHMIM, a t. of Upper Egypt, 53 m. s.s.e. from Siout, on the right bank of the Nile, and about a quarter of a mile from it. It occupies the site of the ancient *Chemnis*, or *Panopolis*, one of the great cities of the Thebaid. Remains of ancient buildings exist. Cotton fabrics are manufactured here. Pop. supposed to be about 10,000.

EKRON, the most northerly of the five cities of the Philistines. It was assigned to Judah, but afterwards given to Dan. Before the monarchy it again came under the rule of the Philistines. It was the last place to which the captured ark of the covenant was taken by the Philistines, before its restoration to the Israelites. After David's victory over Goliath, the Philistines were pursued as far as this place. The name occurs in cuneiform inscriptions and on Syrian monuments. The site has been recognized in Akir, a Moslem village 5 m. s.w. of Ramleh. It has a dreary and forsaken appearance.

ELÆAG'NUS, a genus of exogenous plants, of the natural order *elæagnaceæ*. This order consists of trees and shrubs, usually covered with scurfy scales, and having alternate or opposite entire leaves, without stipules. There are only about thirty known species of this order, all natives of the northern hemisphere, but found both in its warm and cold regions. The sallowthorn (q.v.) is the only British species. *Shepherdia argentea*, a North American shrub of this order, yields a pleasant fruit. The genus *elæagnus* consists of a number of deciduous shrubs or low trees, with male and female flowers on the same plant. *E. angustifolia*, the OLEASTER, sometimes called wild olive, is a native of the s. of Europe and the Levant, a spiny tree of 15 to 20 ft. in height, with lanceolate leaves, which, as well as the young shoots, are hoary with stellate hairs. It is frequently planted in England, for the sake of its silvery white foliage, beautifully contrasting with the green of other trees, and its very fragrant flowers, which are small and of a dull yellow color.

ELÆIS. See OIL PALM.

ELÆOCARPA'CEÆ, according to some botanists, a natural order of exogenous plants, but regarded by others as merely a sub-order of *tiliaceæ*; the chief distinctions being deeply cut or fringed petals and anthers opening at the apex. The E. are mostly East Indian trees. The fruits of some are eaten; those of some are dried and put into curries; those of *elæocarpus serratus* are pickled in brine and eaten with oil in Ceylon, and much resemble olives. *E. cyaneus*, a native of New Holland, is here figured. The deeply wrinkled seed or stone of the fruit of some, particularly *elæocarpus ganitrus* and *monocera tuberculata*, being very hard, and having a fine sculptured appearance, are made into beads for necklaces and bracelets, and are sometimes set in gold. They are often called OLIVE NUTS. These beads are frequently worn by religious devotees in India, and are sometimes sold as ornaments in the shops of Europe.

ELÆOCOC'CA, a genus of *euphorbiaceæ*, the seeds of some of which yield useful oils. The oil obtained from *E. verrucosa* is used for food in Japan, notwithstanding considerable acridity. The tree is cultivated in the Mauritius, and the oil is there used only for burning. That obtained from *E. vernicia* is used in painting in China.

ELÆODEN'DRON, a genus of trees of the natural order *celastraceæ*, having a 5-partite calyx, 5 petals, a 5-angled disk, 5 stamens, the ovary immersed in the disk, and a drupaceous fruit. *E. glaucum*, a native of Ceylon and the s. of India, is sometimes called the *Ceylon tea-tree*, from the resemblance of its leaves to those of the tea-shrub. The timber of *E. croceum*, called SAFFRONWOOD at the cape of Good Hope, is much used there in building and cabinet-making; it is fine-grained, hard, and tough. The fruit of *E. kuba*, another South African species, is eaten by the colonists. That of *E. argan* yields an oil similar to olive oil, much used by the Moors.

ELAGAB'ALUS, or HELIOGABALUS, emperor of Rome, was b. at Emesa in 204 A.D. His real name was Varius Avitus Bassianus, but having, when a mere child, been appointed high-priest of the Syro-Phenician sun-god Elagabal, he assumed the name of that deity. Soon after the death of his cousin Caracalla, E. was proclaimed emperor by the soldiers, in opposition to the legitimate sovereign, Macrinus, who had become obnoxious to the troops from the severity of his discipline. The rivals met in battle at Antioch in 218 A.D. Macrinus was defeated, and E. quietly assumed the purple. His reign, which lasted rather more than three years and nine months, was infamous for nearly unparalleled debaucheries of every kind in which he indulged. He was murdered in an insurrection of the prætorians in 222 A.D., and was succeeded by his cousin and adopted son, Alexander Severus.

EL-ARA'BAH is the name of the great depression of country which extends from the Dead sea to the gulf of Akabah. From the foot of Mt. Hermon to the Elanitic gulf of the Red sea there is a deep valley that is classed by geographers among the most remarkable depressions on the globe. It is divided by a line of chalk cliffs, which cross it about 6 m. s. of the Dead sea. North of these the valley, at the present day, is named El-Ghor (q.v.); s. of them the old Hebrew name El-Arabah is retained. The whole length of this part is about 100 miles. Its greatest width, 60 m. n. of the gulf of Akabah, is from 10 to 12 m.; its least at the gulf, not more than 3 or 4 miles. On the *western* side are the horizontal lines of the Tih, white and desolate, mounting up 1500 or 1800 ft. from the valley by huge steps, with level barren tracts on their tops, and crowned by the plateau of "the wilderness of the wanderings." This range has two principal passes; one, very steep and difficult, is close to the gulf, and is known simply as "the pass." Through it the Mecca pilgrims climb. The other, on the road from Petra to Hebron and leading up from the plateau to a level 1000 ft. higher, is probably the point at which the Israelites, when attempting against the divine command to "go up" into the promised land, were repulsed by the Amalekites coming down from the hill. On the *eastern* side are the mountains of Edom, which rise to a height of more than 2,000 ft., and are crowned by Mt. Hor, 5,000 ft. high. These mountains are verdant, and in many parts cultivated, yielding good crops. Ruined towns and villages abound, attesting the former prosperity of the country. The numerous wadys, which come down from the mountains, generally contain streams sufficient to keep vegetation alive. One of these begins near the Akabah, leading by the back of the range to Petra, and thence to the

Dead sea. Along it there are traces of a Roman road. Another gives the most direct access from El-A. to Petra. After the discovery that a prolonged depression exists from Mt. Hermon to the Red sea many persons naturally assumed that the Jordan formerly flowed through its whole extent. But this theory is sufficiently disproved by the levels, imperfect as they are, which have lately been taken of the Jordan and the Dead sea. These have been found to be below the level of the gulf of Akabah and the drainage of the northern portion of El-A. is into the Dead sea, and that of the southern portion into the gulf.

ELA'IN. See OLEINE, *ante*.

ELAM, or SUSIANA, an ancient name of the mountainous district e. of Babylonia, stretching from India to the Persian gulf, including a low tract of fertile land in which are the marshes around the mouths of the Tigris and Euphrates. Its inhabitants were mostly nomadic. In certain portions it produces large quantities of grain. The chief city and capital was Shusan, or Susa.

E'LAND, *Antilope oreas*, a species of antelope, abounding in s. Africa, wherever there are fertile plains and low hills, except in the longest settled and most cultivated parts of Cape Colony, where it has been too much hunted to be any longer of very frequent occurrence. It is described by Livingstone as "the most magnificent of all antelopes." It is one of those which are sometimes called *bovine* antelopes, because they seem to approximate a little in some of their characters to the ox-tribe, having a broader muzzle, less slender limbs, and greater bulkiness of form than the antelopes in general. The E., however, is a very graceful and beautiful animal; it is as large as a horse, fully 5 ft. in height at the shoulder, and weighs from 7 to 9 cwt. The horns—which in the male are about a foot and a half long, and in the female longer and more slender—are almost straight, inclining backwards and outwards; they are pointed, and their great strength is increased by a spiral wreath. The E. has a large protuberance on the larynx, in this resembling the elk, from which, probably on this account, it has derived its name. It is also known as the *impoof* or *impoofoo*. Its tail very much resembles that of an ox, and terminates in a tuft of long black hair. It is a gregarious animal, and the herds are often large. It is generally very fat, and not difficult of pursuit, its gentleness also increasing the facilities of the hunter. Its flesh is very much esteemed, particularly the muscles of the thighs, which are dried like tongues. It is surprising that no attempt has been made to domesticate, for useful purposes, an animal very easy of domestication, and possessing so many valuable qualities.

Livingstone discovered a variety of the E. in regions to the n. of the Cape Colony, having the body marked with narrow white transverse bands. According to the figure given in his travels, it seems even more bovine in form than the common variety.

E'LANET, *Elanus*, a genus of *falconidæ*, allied to the kites, which they resemble in many of their characters; but from which they differ in having the short tarsi half covered with feathers, and the claws, except that of the middle toe, rounded beneath. The tail is very little forked. One species (*E. melanopterus*) is common in Africa, from Egypt to the cape of Good Hope, and is found also in India. Another species is the black-shouldered hawk (*E. dispar*) of America, the northern limit of which appears to be South Carolina. Both of these feed chiefly on insects, which they catch on the wing, but they also prey on small birds and reptiles.

ELAPS, a genus of venomous serpents, inhabiting the warm parts of the world, and chiefly the Indian islands, New Holland, and tropical America. They are of slender and cylindrical form, with an elongated head, and often of bright and beautiful colors. They are not very agile, are said to prey chiefly on other reptiles, and live among the luxuriant vegetation of meadows or of forests.

EL-ARAISH, or L'ARAISH (Fr. Larache), a t. in Morocco, on the Atlantic ocean, 45 m. s. of Tangier, well situated on a rocky height, and the seat of a military governor. It is one of the most frequented ports on that part of the coast. Pop. about 5,000.

ELASMOSAU'RIANS, gigantic marine saurians of the cretaceous epoch. One species had vertebræ nearly as large as those of an elephant. It was like a whale in bulk, with a long flexible neck, paddles short, tail serpent-like, skull light with a long flat muzzle with nostrils or spout-holes near the orbits, teeth sharp and well fitted for seizing fish. It reached 45 ft. in length. Its remains have been found, especially in New Jersey.

ELASTIC CURVE, according to James Bèrnoulli, the figure which would be taken by a thin horizontal elastic plate if one end was fixed and the other loaded with weights.

ELASTICITY, or SPRING. When an external force acts upon a solid body, it produces at first slight alterations in the relative positions of the particles; and if before these alterations exceed a certain limit, the force ceases to act, the particles return to their former position, and the disfigurement disappears. This power or property of recovering their previous form after alteration, is called E., and we are justified in ascribing it to all bodies, though in very different degrees. It was once believed that there were definite limits within which changes of form produced by pressure or other

forces disappeared completely. It was thought, for instance, that when a weight of no great magnitude is suspended from a metallic wire, the slight increase of length which the wire is observed to undergo, is completely lost when the weight is removed; and the limit to which the wire might thus be stretched, and still suffer no permanent increase of length, was called the limit of its elasticity. But recent more accurate experiments have shown that no such limits exist, at least in the case of metals; or, which is the same thing, that permanent lengthening results, however slightly the wire be loaded—it never contracts again quite so far as it was stretched. It is necessary, therefore, to fix the limit arbitrarily; and this is done by agreeing that it shall be held to begin when the metal in question suffers a permanent elongation of 0.00005 of its length. To get the elastic extensibility of a wire, then, we must compare its length suspended, with its length when the weight is removed. In this way it is found that the extensions produced are proportional to the extending forces or weights. From this law, then, we can calculate what weight it would require to stretch a wire or rod of a sq. in. in section to double its own length; supposing it possible to proceed so far without breaking it, and that the law of E. continued up to this point unaltered. This weight, which is different for every metal or kind of wood, is called the *co-efficient* or *modulus of elasticity* of the particular substance; and is used in mechanics in calculating how far a given weight will extend a wire or rod of given diameter. This co-efficient is not constant for the same metal; for all circumstances that increase the density of the metal, increase the modulus of elasticity. Bodies manifest E., not only when extended in length, but also when compressed, when bent, or when twisted. If an ivory ball be dropped from a height upon a marble slab smeared with fat and lampblack, when caught after the rebound, it is seen to have touched the marble, not in a point, but in a circle of several lines in diameter, and must therefore have lost for a time its spherical shape over that extent. In the same way the mark of a well-hit golf-ball is pretty broadly shown upon the face of a club after the stroke. The E. shown by wires and threads of glass when twisted, has been turned to account in the torsion-balance (q.v.), for measuring other weak forces. Steel, ivory, caoutchouc, etc., are well known for their elastic properties, to which they owe much of their utility.

The propagation of waves of sound through solid bodies depends upon their E.; and from observations of this kind made with different substances, the modulus of E. for each may be deduced; the results, however, differ slightly from those arrived at by attaching weights, owing to the heat produced by the vibratory movement.

All solid bodies are only imperfectly elastic—that is, they do not quite recover their form and volume when the disturbing force ceases. Liquids and gases, on the contrary, are perfectly elastic, or return exactly to their original bulk or volume when the pressure is removed. The elasticity of liquids and gases, however, acts only in expanding after compression, while that of solids acts also in contracting after extension. The expansive elasticity of liquids and gases is equal to the force used to compress them. Water and other liquids are easily seen to be compressible, by the fact of their conveying sound—a sound-wave being merely a *state* of compression, propagated from each layer of the liquid to the next. The coefficient of elasticity of water determined by Colladon and Sturm, from the velocity of sound in the lake of Geneva, agrees very well with that determined by direct measurements in Oerstedt's apparatus. The discovery of the compressibility of water is an English one, due to Canton, in 1763. Previous attempts, by Italian and Dutch philosophers, to compress water by hammering a silver shell filled with that fluid, had failed to give any certain result, as the water was forced through the pores of the metal. At a temperature of 50°, one atmosphere compresses water to about 0.999995 of its volume. From the existence of a maximum density temperature for water, some curious consequences arise with regard to the effects of pressure on the fluid. The volumes or bulks which a given quantity of any gas assumes under different pressures, are nearly in inverse proportion to the pressures. See MARIOTTE'S LAW. The elasticity of gases is usually measured by the height of the column of mercury that they sustain. The elasticity of gases is a force much and variously employed in the arts of life. See AIR-GUN, AIR-PUMP, GUNPOWDER, etc.

ELASTIC TISSUE, known also as yellow fibrous tissue, is one of the forms of fibrous tissue (q.v.). It derives its name from the remarkable physical property which it possesses of permitting its fibers to be drawn out to double their length, and again returning to their original length. It occurs in various ligamentous and other structures of the animal body in which elasticity is required, as, for example, in the vocal cords, the membranes connecting the cartilaginous rings of the trachea, the middle coat of the arteries, the skin, etc.

ELATE'A (anc. CITHÆRON), a mountain range in Greece, between Bœotia and Attica, frequently mentioned by the early poets. The highest peak is a little over 4,600 ft. above sea-level.

EL'ATER, a Linnæan genus of coleopterous insects, now divided into many genera, and forming the tribe or family *elateridæ*. They have a narrow elongated body; the head is in almost all cases inserted deeply into the thorax; a strong spine on the under part of the thorax at its base, fits into a groove; the legs are short, and rather slender.

They are generally found upon the flowers and leaves of plants, which are their food. When disturbed, they fold their legs and antennæ close to the body, and let themselves drop to the ground. If they fall on their back, or are placed on it, the shortness of their legs incapacitates them for obtaining another position by the means common to other insects; but they are enabled to do so by a violent muscular exertion, arching the body a little, and suddenly straightening it again, so that they fling themselves into the air with a jerk and a *click*. Hence the names click-beetle (q.v.) and SKIP-JACK. The spine and groove of the thorax are supposed to be of use in this. The larvæ are long, rather slender, with six feet near the head, and a tough skin. Many feed on rotten wood; others, wire-worms (q.v.), on the roots of plants. Many are British. Some of the *elateridæ* of tropical regions diffuse from spots on the thorax a strong and beautiful light, and are called fire-flies (q.v.).

ELATE'RIUM, a drug obtained from the fruit of the SQUIRTING CUCUMBER, or SPIRTING CUCUMBER (*ecbalium agreste*, formerly known as *momordica elaterium*), also called the wild cucumber, an annual plant of the natural order cucurbitaceæ, a native of the s. of Europe, common on rubbish in the villages of Greece and the archipelago. The whole plant is rough, with stiff hairs; it has a trailing branching stem, without tendrils; the leaves are heart-shaped, somewhat lobed and toothed, on long stalks; the flowers axillary, yellow, the male flowers in small racemes; the fruit oblong, about an inch and a half long, grayish green, covered with soft prickles, and finally parting from its stalk, and expelling its seeds along with a thin mucus through the aperture where the stalk was inserted. This remarkable phonomenon is ascribed to osmotic action within the fruit; a thin membrane separating a mucus which immediately surrounds the seeds from a less dense juice which abounds in the succulent part of the fruit, and the quantity of the former being gradually increased at the expense of the latter, till, on the perfect ripening of the fruit, the much distended central cell is opened, to permit its ejection. It is this mucus surrounding the seeds—a thick green mucus of a very peculiar character—which contains the elaterium. To obtain the drug, the juice of the nearly ripened fruit is allowed to stand for a short time, when it becomes turbid, and deposits a sediment. The sediment, carefully collected and dried, is elaterium. It is of a pale grayish-green color, light and friable, with an acrid taste, and a peculiar not unpleasant odor. It is an exceedingly powerful or drastic purgative, used chiefly in dropsies, and in very small often-repeated doses. It should not be used except under medical advice. It acts as an irritant not only on the eyes, if it comes in contract with them, but even on the fingers of those who handle it. Its properties seem to depend chiefly on a crystalline principle called *elaterin*. The use of E. was known to the ancients. A few acres of the squirting cucumber are grown at Mitcham, in Surrey.

ELATH, or ELANE (now AILAH), a t. in Idumea on the shore of the Elanitic gulf of the Red sea; the place where Solomon fitted out his ships for bringing treasures from Ophir. David captured it from the Edomites. It is an important point in the route between Medina and Cairo.

ELATMA. See JELATOM.

ELBA (Lat. *Ilva*, Gr. *Æthalia*), an island belonging to the kingdom of Italy, in the Mediterranean sea, between Corsica and the coast of Tuscany, from the latter of which it is separated by the channel of Piombino, a strait 5 m. in breadth. Its greatest length is about 18 m., and its breadth varies from 3 to 10 m., this irregularity being caused by indentations both on its northern and southern shores. Its area is about 90 sq. miles. The coast is bold and precipitous. The surface is traversed from w. to e. by a chain of mountains, which divides into two spurs at the eastern extremity of the island; the highest summit, Monte della Capana, attaining an elevation of 3,600 ft. above sea-level. These mountains are for the most part bare; but on their lower ridges, and in the valleys, the vine, olive, mulberry, and other trees flourish. The climate, except in the low-lying districts on the shore, is temperate and healthy. There are few streams in E., but it has numerous wells. The principal products are wine, white, red, and sweet, and of good qualtity; wheat, Indian corn, vegetables, and water-melons. Fifty thousand cwts. of salt are produced annually from the salt-pans on the shore. Sheep, goats, pigs, and asses abound, but horned cattle and horses are scarce; the coasts supply fish plentifully. Iron of excellent quality is obtained from a mountain in E., 2 m. in circumference, and 500 ft. in height. This hill, which stands on the e. coast, is almost entirely a mass of ore, and so rich that it yields from 50 to 75 per cent. E. also yields loadstone, alum, vitriol, and marble. Porto Ferrajo, the capital and residence of the governor, has a population of about 4,000. E. has been rendered famous in history from having been Napoleon's place of exile from May, 1814, till Feb. 1815. Pop. about 22,000.

EL BASSAN, ALBASSAN, or ILBASSAN, a t. of European Turkey, in the province of Albania, on the Scombi, 35 m. e. from the mouth of the river. It stands in a fertile plain, surrounded by mountains, is the capital of a sanjak, and the seat of a Greek bishop. It has manufactures of iron and copper wares. Pop. 10,000.

ELBE (called by the Romans *Albis*—i.e., white—and by the Bohemians *Labe*) an important river of northern Europe. It originates in the confluence of numerous

streams which rise at the south-western base of the Schneekoppe (Snowcap), one of the highest summits of the Riesen-Gebirge, a mountain-range on the northern border of Bohemia. The course of the E. begins near lat. 50° 45′ n., long. 15° 36′ e.; at an elevation of about 4,400 ft. above sea-level. Its total length, including windings, is estimated at from 700 to 720 m. and its basin at 56,000 sq. miles. The average depth of the E. is 10 ft., and its mean breadth 900 ft., although occasionally it has a width of upwards of 1000 ft., and at its mouth of several miles. In the course of its progress to the sea, it is joined by 17 rivers and upwards of 70 streams. From the base of the Schneekoppe, it flows s. to Pardubitz, whence it proceeds w. to Brandeis, and afterwards in a general n.w. direction past Melnik, Leitmeritz, Aussig, and Tetschen, where it quits the Bohemian territory, and enters Saxony. At this point, it is 355 ft. wide. Its principal affluent in Bohemia is the Moldau. On its course n.w. through Saxony, the E. passes Pirna, Dresden, and Meissen, and entering Prussian Saxony, about 7 m. above Mühlberg, it advances to Rorgau and Wittenberg, from which point it flows first w., then n.w. to Magdeburg, receiving in its progress the Mulde and the Saale, both from the left. From Magdeburg flowing n.e., the E. arrives at the border of Brandenburg, receiving the Havel from the right; then turning n.w., it forms the boundary between Prussian Saxony and Brandenburg, and enters Hanover, through which it flows for upwards of 30 miles. Then still flowing n.w., it forms the boundary of Lauenburg, the Hamburg territory, and Holstein on the n., and Hanover on the s., until it empties itself into the North sea at Cuxhaven, where it attains a breadth of upwards of 10 miles. At this point, the tide rises 12 or 13 feet. The E. is divided into several branches between Hamburg on the n., and Harburg on the s., by the numerous islands that there interrupt its course. Vessels of 14 ft. draught can at all times ascend to Hamburg. The scenery of the valley of the E., although generally pleasing, is not remarkable in any portion of its course, except that which extends between Aussig and Dresden. Between these two towns, the course of the E. is generally between bold cliffs, and high natural battlements of rock; the banks covered with foliage, wherever a tree can support itself; and occasionally varied by a strip of green glade. It has been said that here the E. has all the variety of the English Wye, on a scale nearly as majestic as that of the Rhine. Its waters are stocked with abundance of highly esteemed fish; beavers likewise build in the stream. Steam-boats ply from Dresden up the river, and down as far as Torgau, as well as from Magdeburg to the sea. The navigation of the E. was formerly impeded by all manner of imposts and monopolies; and, what was quite as bad, sand was allowed to accumulate, so that vessels were often obliged to wait three or four weeks for want of sufficient water. The former of these impediments has of late years been gradually removed, till in 1870 all then existing tolls were abolished, but something still remains to be done towards improving the channel.

ELBERFELD, one of the most important manufacturing towns in Germany, is situated on both sides of the Wupper, an affluent of the Rhine, 16 m. e.n.e. of Düsseldorf. Its site, in the narrow and hill-girt valley of the Wupper, is picturesque and healthy. The old parts of the town are poorly built, straggling, and irregular, but the more recently erected portion is well built, with numerous spacious and imposing buildings, in a high architectural style. E. is chiefly famous for its dyeing, bleaching, and printing establishments, also for its extensive and important manufactures of cotton, silks, tapes, ribbons, merinos, fancy woolen goods, velvets, etc. Bleach-fields occupy a great part of the envirous of E., and of the banks of the Wupper, the waters of which are said to possess very valuable bleaching properties. At E., the well-known dye, Turkey red, is imparted to yarns, at a cheaper rate, and with more clearness and firmness of color, than at any other town in Europe. The patterns for the printed goods are designed at Elberfeld. E. supports, amongst its numerous educational institutions, an important establishment, in which young manufacturers and overseers are taught the management of the Jacquard-loom, pattern-drawing, etc. Like the rest of the Wupper valley, E. is notable for religious zeal and orthodoxy. Pop. '40, 31,500; '75, 80,599 (mostly Protestants). E. is connected by a tramway with the neighboring town of Barmen (q.v.), also the seat of extensive manufactures.

ELBEUF, or ELBŒUF, a manufacturing t. of France, in the department of Seine-Inférieure, is delightfully situated in a picturesque valley on the left bank of the Seine, about 75 m. n.w. from Paris. It was originally badly built, but it has recently been greatly improved. Large factories also have arisen rapidly; and a spacious market-place (*champ de foire*), adorned with rows of chestnut-trees, has been erected. The two principal public buildings of E. are the churches of St. Etienne and St. Jean-Baptiste, both containing fine specimens of richly painted glass. The factories of E. and the vicinity exceed 200 in number; these are for the most part worked by steam-power, and give regular employment to more than the half of the population. The manufactures are principally double-milled and waterproof cloth, flannel fabrics, billiard table-covers, and light woolens of every color and description. E. has active steam communication with Paris, Havre, and Rouen. The pop. in 1876 was 21,935. E., which has been called the Leeds of France, had 80 cloth manufactories as early as the 16th century. In consequence of the revocation of the Edict of Nantes, the greater number of the cloth manufacturers emigrated; and it was not till after the revolution

of 1789, and more particularly since the separation of Belgium and France, that industry again began to flourish.

ELBERT, a co. in n.e. Georgia, on the Savannah river; 514 sq.m.; pop. '70, 9,249—4,863 colored. Surface hilly, with much forest land; soil fertile, producing corn, cotton, etc. Co. seat, Elberton.

ELBERT, SAMUEL, 1743–88; b. S. C.; served in the revolutionary army, rising to col. In 1785, he was elected governor of Georgia.

ELBING, a considerable trading and manufacturing t. in West Prussia, is situated in the midst of a fertile valley, on the navigable river of the same name, 34 m. e.s.e. of Danzig, and 5 m. s. of the s.w. extremity of the Frisches Haff, into which the Elbing flows. It is connected by a canal with the Nogat, the eastern arm of the Vistula. The town was formerly surrounded with walls and mounds, of which, however, there are now but few remains. Of the numerous churches, the most remarkable is the Marienkirche, erected in the 14th century. The gymnasium, founded in the year 1536, contains the town library, consisting of 24,000 volumes. There are likewise several well-conducted educational and charitable institutions. The manufactures are chiefly linen and cotton cloths, leather, tobacco, soap, and chicory. There are also oil manufactories, iron foundries, breweries, dye and print works. E. was founded about the beginning of the 13th c., by colonists from Lübeck and Bremen, who settled round the fortress erected by the German knights. After various vicissitudes, it was annexed to Prussia in 1772, and after a period of decline, has again risen to a thriving condition. The larger vessels unload at Pilau, which serves as the harbor of Elbing. Pop. '75, 33,572.

ELBOW. See ARM.

ELBOW-PIECES, in armor, or *coudières*, were the metal-plates used to cover the junction of the rere-brace and vant-brace, by which the upper and lower half of the arm were covered. They increased to an enormous size, as in the effigy of sir Thomas Peyton, in Isleham church, but again decreased to their normal size. An *elbow gauntlet* was a gauntlet of plate reaching to the elbow, adopted from the Asiatics in the 16th century.—Fairholt's *Costume in England*, p. 494.

ELBURZ', a lofty mountain-range that runs longitudinally along the entire southern border of the Caspian sea. It frequently divides itself into subordinate parallel ridges, inclosing extensive and fertile valleys, many of which are well inhabited and carefully cultivated. Demavend (q.v.), said to be 21,000 ft. in height, is one of the highest summits.—ELBURZ, or ELBRUZ, is also the name of one of the summits of the Caucasus, 18,500 ft. high.

ELCHE (anciently, *Ilice*, or *Illice*), a t. of Spain, in the province of Alicante, and 16 m. s.w. of the town of that name, is picturesquely built on both sides of a steep ravine, near the Elda, a tributary of the Segura, and about two leagues from the sea. It has an oriental appearance. The climate is eastern, winter is unknown, and around the town rises a huge encircling plantation of palms; the Arab alone is wanting to complete the likeness to an eastern city. E. is a flourishing town, is well built, its streets in general are wide and clean, and it has numerous squares and public walks. The church of Santa Maria is an imposing edifice, with a large dome, five gates, a famous organ, and a tabernacle made of precious marbles. The dates gathered from the palm plantation around E. are exported from Alicante; they are not so good as Barbary dates, though sold as such. Its manufactures are linens, woolens, cottons, brandy, wine, cigars, oil, soap, etc.; in these articles, and in cattle, rice, and wool, there is a considerable trade. Pop. about 18,500.

EL'CHINGEN, a village of Bavaria, on the left bank of the Danube, about 8 m. n.e. of Ulm. It is noteworthy as the scene of a battle fought on the 13th Oct., 1805, between the French under Ney and the Austrians under Laudon, in which the latter were defeated. Ney's victory obtained for him the title of duke of Elchingen.

ELCHO, FRANCIS WEMYSS-CHARTERIS-DOUGLAS, Lord, b. Aug. 4, 1818, is eldest son of the eighth earl of Wemyss. This ancient Scottish family has a traditional descent assigned it from the house of Macduff, earl of Fife. Sir Michael de Wemyss in 1290 was sent to Norway by the lords of the regency in Scotland to conduct the young queen Margaret to her dominions. He swore fealty to Edward I. in 1296, and was a witness to the act of settlement of the crown of Scotland by king Robert I. at Ayr in 1315. From him lineally descended Sir John Wemyss, who was created a baronet in 1625; raised to the peerage of Scotland as baron Wemyss of Elcho in 1628; and advanced to the dignities of earl of Wemyss in the county of Fife, and lord Elcho and Methel, in 1633. Although indebted for his honors to Charles I., he was engaged during the subsequent civil wars on the side of the parliament. David, fourth earl, was appointed by queen Anne lord-high-admiral of Scotland, and one of the commissioners for concluding the treaty of union. The eldest son of the fifth earl having taken part in the rising of 1745, escaped to France after the battle of Culloden, and was attainted. At his death, the family honors were taken up by his brother Francis, sixth earl, who, having inherited the estates of his maternal grandfather, col. Charteris, of Amisfield, co. Hadding-

ton, had assumed the surname of Charteris before that of Wemyss. Francis, his grandson, became heir to the titles of earl of March, viscount Peebles, and baron Douglas of Neidpath, on the demise of William, third earl of March, and fourth duke of Queensberry, in 1810. In 1821, he was made baron Wemyss of the United Kingdom, by which title the possessor of the earldom holds his seat in the house of lords. A parliamentary reversal of the attainder of lord Elcho, obtained in 1826, put beyond question the succession to the Scottish honors. His son, the present earl, is lord-lieut. of Peebleshire and lieut-gen. of the royal archers.

Lord E. was educated at Christ Church, Oxford, where he graduated B.A. in 1841. He was returned to the house of commons as M.P. for East Gloucestershire from July, 1841, to Feb., 1846, and has sat for Haddingtonshire since 1847 to the present time. He took his seat on the conservative benches, but accepted office, with other members of the party of sir Robert Peel, in the coalition government of the earl of Aberdeen, and was a lord of the treasury from Jan., 1853, to Feb., 1855. In 1859, the menacing attitude of France, and the periodical recurrence of seasons of alarm, caused by the unprotected state of our shores, and the possibility of invasion, led to an organization of rifle volunteers in Great Britain. In this movement, lord Elcho took the earliest and most prominent part. He organized a regiment of London Scottish volunteer rifles, of which he was appointed maj. in 1859, and lieut.-col. in 1850, and went to Hythe barracks to receive instruction in the use of the Enfield rifle, and to the camp at Shorncliffe, in order to become familiarized with regimental duties and brigade movements. Lord Elcho also projected the national association for the promotion of rifle-shooting, the first shot at which was fired by her majesty, July 2, 1860, at Wimbledon. He and other patriotic noblemen and gentlemen associated with him in the volunteer movement, had the satisfaction of assisting, in 1860, at two grand reviews by the queen of various brigades of volunteer rifle corps—of 20,000 men in Hyde park, and 22,000 men in Edinburgh. The war office assisted in organizing the force, and thus was consolidated the volunteer army of Great Britain, who adopted as their motto "Defence, not Defiance." The national rifle association, mainly under the auspices of earl Spencer and lord E., has become an established institution—the center and keystone of the volunteer movement. Lord E. has since given additional efficiency to the volunteer movement by watching, in his place in parliament, its financial relations with the government. In 1865, lord E. took a more active part in parliamentary politics than had been possible during his labors in promoting the volunteer movement. He spoke against the £6 franchise proposed by Mr. Baines, and gave notice of a motion for a royal commision to examine into the extension of the franchise. When the government of earl Russell brought in the reform bill of 1866, lord E. organized a secession from the Whig party, under the leadership of earl Grosvenor, which was nicknamed the "Cave of Adullam," but which succeeded in defeating the bill, and displacing the government. Lord Derby, on his accession to the premiership, offered a post in his government to lord E., but the offer was declined. In 1867, his party found themselves powerless to prevent the passing of a more democratic reform bill than that which in the previous year they had thrown out. Lord E. is a fluent and pleasant speaker, and he is exceedingly popular with the volunteers both of England and Scotland. Lord E. is an LL.D. of Edinburgh univesity. In 1871, he published *Letters on Military Organization*. In 1875, he drew public attention to the military organization of Great Britain.

ELDER, *Sambucus*, a genus of plants of the natural order *caprifoliaceæ*, consisting chiefly of shrubs and trees, with pinnate leaves, small flowers of which the corolla is wheel-shaped and 5-cleft, and 3-seeded berries. The wood of the young shoots contains a very large pith. The species are very widely distributed.—The COMMON E. (*S. nigra*), the *bourtree* of the Scotch, is a native of Europe, the n. of Asia, and the n. of Africa. It is found in all parts of Britain. It is a very large shrub, sometimes a small tree, with rather large leaves, and large terminal cymes of cream-colored flowers, which are followed by small black—or rarely whitish—berries. Its leaves and young shoots diffuse a narcotic ordor, and it is said to be dangerous to sleep under its shade. The inner bark has a bitter acrid taste. The leaves possess the same properties in a rather milder degree. The flowers have a peculiar sweetish and rather sickening smell, but are much used for making a distilled water—*elder-flower water*—which has a very agreeable odor, and is employed both in perfumery and confectionery. Distilled with water alone, they yield a volatile oil, which, on cooling, assumes a buttery consistence. A popular cooling ointment is made by boiling them in lard. They are also used for imparting a flavor to currant-wine and jelly, being added at the time of a slight fermentation which takes place in the spring of the year, after the currant-wine is made; and a wine is made from them which in scent and flavor resembles Frontignac. The clustered flower-buds are pickled, and used like capers. A grateful wine, well known in England, especially about Christmas, is made from the berries; and in some parts of Kent there are large plantations of E. to supply the London market for its manufacture. It is generally drunk hot or *mulled*. The berries are subacid and sweetish, with a rather unpleasant flavor. A rob made from them is a gentle aperient, diuretic, and sudorific, easily administered to children. In some parts of Germany, the poorer people use them as an ingredient in soups. They are said to be used to no small extent in England in the

adulteration of port wine, and the manufacture of spurious port wine.—The wood of the E. is yellow; that of old trees is very hard and tough, takes a fine polish, is used by turners, and as a substitute for box-wood in making mathematical instruments and other articles. Tops of fishing-rods are sometimes made of it. The pith of the young shoots, being very light, is generally used to make pith-balls for electrical experiments. Toys for children are also made of it; and few boys are unacquainted with the use of E. branches, from which it has been expelled, for making pop-guns. The E. is very useful as a screen fence near the sea and in other exposed situations, as it grows with remarkable vigor, and makes great shoots, the destruction of the more tender and less matured parts of which in winter only tends to make it more bushy and useful for shelter. It is readily propagated by portions of its shoots stuck into the ground.—The SCARLET-FRUITED E. (*S. racemosa*), a native of the s. of Europe and of Siberia, much resembles the common E., but has softer and more herbaceous shoots, remarkably large buds, which are conspicuous in winter, and racemes of greenish-white flowers, which are followed by scarlet berries, the racemes of ripe fruit having much the appearance of beautiful pieces of coral. It is a frequent ornament of shrubberies in Britain, and when in full fruit, is almost unrivaled in beauty, but more frequently produces its fruit in cold districts than in those where the milder winter induces it to flower before the spring frosts are over. The juice of its berries is a powerful sudorific.—The DWARF E., or DANEWORT (*S. ebulus*), is a rather rare British plant, a coarse, herbaceous plant, with fetid smell. The *inner bark* has been employed in dropsical complaints as a hydragogue cathartic, and is given in the form of a decoction prepared by boiling down 1 oz. of the bark in 2 pints of water till the whole is concentrated to 1 pint. The dose is about 4 fluid ounces. In smaller quantities, it is useful as an aperient in certain chronic disorders. The *flowers* are white when freshly plucked, but become yellow in drying, and consist of a volatile oil, certain gummy, resinous, albuminous, and saline matters, and are stimulant and sudorific. They are employed in the preparation of *elder-flower water* by adding 2 gallons of water and 3 ozs. of rectified spirit to 10 lbs. of the flowers, and distilling off about 1 gallon. It is a good perfume. *White elder ointment* is procured by boiling equal weights of lard and elder flowers, and pressing through a cloth. It has an agreeable odor, and is employed as a cooling application to surfaces which are irritable. When the berries are expressed, they yield a purple juice named *elder rob*, which, when diluted with water, is useful in inflammatory and febrile complaints as a cooling drink. It contains malic and citric acids, sugar, gum, etc.

ELDER, an office-bearer in Presbyterian churches. The name is an exact translation of the Greek *presbyteros*, which occurs frequently in the New Testament, and from which the English word *priest* is derived. That the *presbyteroi* of the churches of the apostolic age were not *priests* in the special sense of that word, in which it denotes a person appointed to offer sacrifice on behalf of others, and to appear for them before God, is admitted by Protestants in general; but there remains much division of opinion as to the precise meaning of the term, and the bearing of the passages in which it occurs on the subject of church government. See BISHOP, INDEPENDENTS, and PRESBYTERIANISM. All are agreed, indeed, that *bishops* and all pastors of congregations are included among *elders* in the Scriptural use of the term; but the ordinary use of it is now limited to Presbyterian churches, and in them it has become the usual designation of the office-bearers associated with the minister of each congregation in the care and oversight of the flock. The argument for this class of office-bearers will be found briefly stated in the article PRESBYTERIANISM. They exist in the greater number of the churches of the reformation; and even in the church of England, bishop Burnet states that their introduction was only prevented by queen Elizabeth's dislike to a proposal, in which, with Burleigh and others of her advisers, she saw danger of an abatement of her prerogative, "since, if the concerns of religion came into popular hands, there would be a power set up distinct from hers, over which she could have no authority." In some Protestant churches, elders are appointed only for a certain term of office; but more generally it is until death, resignation, removal from the bounds of the congregation, or deposition. The appointment of elders takes place variously: in the established church of Scotland, they have generally been nominated by the kirk-session (consisting of the minister and elders); in the other Presbyterian churches of Britain and America, they are elected by the congregation. In most of the churches of the continent of Europe, which have any kind of connection with the state, there is some regulation of the civil law or of the civil authorities in this matter. The ordination of elders takes place in the congregation, but usually without imposition of hands; a difference between the mode of ordination of elders and ministers for which it is not easy to account, and which has certainly tended to produce a general impression that a greater difference of office subsists than the advocates of Presbyterianism admit. In the established church of Scotland, the elders have very generally discharged the functions of deacons (q.v.), at least as much as those which, according to the theory of Presbyterianism, belong to their own office, an example which, until recently, was almost universally followed in other Presbyterian churches. According to the *Second Book of Discipline* of the church of Scotland, it is the duty of elders to watch over the spiritual welfare of the people, to admonish, to visit the sick, to assist in the examination of persons seeking admission to the Lord's table,

etc. Elders, along with ministers, compose all the courts or assemblies of the Presbyterian churches, and have equal votes on all questions.

ELDON, BARON, Lord High Chancellor of England. John Scott, better known as lord Eldon, was b. 4th June, 1751, in Love lane, Newcastle, of obscure but respectable parents. William Scott, his father, began life as an apprentice to a "fitter," a sort of water-carrier and broker in coal; later in life, he became a "fitter" himself, and kept a public-house near the quay, to supply drink to his keelmen on the truck-principle; he engaged also in speculations in shipping and marine insurance. By his various occupations he became wealthy, and died worth about £20,000. John Scott's mother was a daughter of a Mr. Atkinson of Newcastle, and to her, lord Campbell, in his *Life of Lord Eldon*, traces the talent inherited by her sons William and John. William became baron Stowell, and was the head for many years of the high court of admiralty. See STOWELL, BARON.

John Scott was educated under the Rev. Hugh Moises, at the grammar-school, Newcastle, and as a boy gave no promise of his subsequent splendid career. On finishing his education under Mr. Moises, he, on 15th May, 1766, entered University college, with a view to the church; the following year he obtained a fellowship, and in the summer of 1771, won the prize for the English essay, but did not otherwise distinguish himself. A clandestine marriage, into which he entered with a Miss Surtees in 1772, nearly ruined him; however, by the advice of his brother, he returned with his wife to the university. Here, during the year of grace, he lived on his fellowship and gains as a private tutor; and the year expiring without a church living falling vacant, he betook himself to the study of law. In 1776, he was called to the bar. By this time, his wife's friends had become reconciled to her, and made her some provision; and by the death of his father, in the year of his passing at the bar, E. found himself in possession of £3,000. On his own and wife's money, he found he could just manage to live, and so settled on the northern circuit. His success on his first circuit was not great; but in his second year his prospects, through the aid of his brother and friends, began to brighten. It was not, however, till 1780, that prosperity could be said to have dawned upon him. A happy chance then occurred of showing both his talents and powers of work. The result was speedy affluence. Business poured in upon him; and by 1787, his practice at the equity bar had so increased, that he was forced to give up the eastern half of his circuit.

With success in his profession, E.'s ambition expanded, and he became political. A silk-gown, and then, through the favor of lord Thurlow, a seat in parliament, were but steps toward knighthood and the post of solicitor-general conferred on him by Pitt. From this point, his progress was secure, and effected much in the way in which political lawyers usually succeed. In 1793, he became attorney-general. In 1799, the office of chief-justice of the court of common pleas falling vacant, his claim to it was not overlooked; and after 17 years' service in the house of commons, he entered the house of peers as baron Eldon. In 1801, on the formation of the Addington ministry, E. ascended the woolsack—a post given to him nominally because of his great anti-Catholic zeal, but really because of his part in the intrigue which ousted his old patron Pitt from office. From this time till 1827, with little intermission, E. continued to occupy the woolsack under successive governments. He was in succession chancellor under Addington, Pitt, and lord Liverpool; and when, after the two brief administrations of Canning and Goderich, the duke of Wellington constructed a cabinet, E. again expected the woolsack, and resented his non-appointment to it. His love of office indeed continued to the last, and in 1835, we find him actually in hopes of office under Peel. In 1834, he ceased to speak in parliament. In 1821, E. was made an earl by George IV.; and in the same year, his brother William was raised to the peerage under the title of lord Stowell. In 1831, he lost by death his wife, his "beloved Bessy." His brother William died in 1836. He himself, after outliving almost all his immediate relations, died in his 87th year, Jan. 3, 1838, leaving behind him a fortune of over half a million sterling.

E. is said to have been a man of very winning and courtly manners, and of a handsome, prepossessing appearance. In the circle of his friends he is said to have been irresistible, and probably to the charms of his manner his success in life was somewhat owing. His career amply proves that he was a man of the greatest talent, sagacity, and power of managing men. He was undoubtedly a great lawyer, and his judgments, which have been much praised for their accuracy, fill a small library; at the same time, he took so long to arrive at them, that he has been charged with having caused more injustice by delay than worse judges by the iniquity of their decisions. For literature, as for art, he had no feeling, and the style of his decisions is generally detestable. He was a great drinker, though drink seems never to have unfitted him for work; and is said, when he went into retirement, to have spent his time over the newspapers and the gossip of old cronies, preferring their company to that of men of refinement and taste. Undoubtedly, the best of him is seen in his private relations. His love of and devotion to "Bessy" his wife was truly beautiful. As a public man, he is far from estimable. He was a great canter, whose life was a succession of intrigues and duplicities. He was no statesman: his one aim in politics was power, and his name is unassociated with even a single law intended purely for the public good. For forty years, he was a lead-

ing enemy of reform and religious liberty. The champion of the church, he never attended on public worship. Without political principles, his whole stock in trade, as a politician, was zeal against the Roman Catholics, which, however, proved enough, in the then state of society. He is said to have added parsimony to his other defects; but while various circumstances, besides the amount of the fortune which he accumulated, favor this charge, it is probable that his apparent parsimony rose out of habits formed in his family while he was yet struggling; and it is certain he was capable of generous actions. See Twiss's admirable book, *Public and Private Life of the Lord Chancellor Eldon; Life of Lord Eldon*, by lord Campbell; *Sketch of the Lives of Lords Stowell and Eldon*, by Dr. W. E. Surtees.

EL DORADO (the golden or rather the gilded land) existed originally in the imaginations of the Spanish conquerors of America, whose insatiable avarice loved to dream of richer rewards than those of Mexico and Peru. The Castilians found an imitator in sir Walter Raleigh, who twice visited Guiana in quest of this fabulous region. The name has at last made for itself an abiding-place beyond the furthest limits of Spanish possession. It indicates a co. in the n.e. of California, of which the capital, Calloma, stands near the spot where the first discovery of gold was made in that state. The district in question is drained by some of the northern feeders of the Sacramento, which empties itself into the bay of San Francisco.

EL DORA'DO, a co. in e. California, reached by the Sacramento and Placerville railroad, drained by branches of the American and the Cosumne rivers; 1872 sq.m.; pop. '70, 10,309—1582 Chinese. It is mountainous, and much of the surface is yet covered with forests of oak and pine. The Sierra Nevada mountains cross the e. part. In the low lands the soil is fertile; but gold-mining is the leading business. Co. seat, Placerville.

EL'EANOR OF AQUITAINE, 1122–1204, Queen of France and afterwards of England, was the daughter of William IX., the last duke of Guienne. She succeeded her father in 1138, and was married the same year to Louis VII. of France. Her lively and somewhat frivolous manners, and her love of pleasure, did not fit her for the society of a husband who was naturally austere, and who from religious conviction had adopted many ascetic habits. They became gradually estranged, and in the Holy Land, whither she accompanied him in 1147, their quarrels became so frequent and so bitter that at last a divorce was agreed upon, which, on their return to France, was completed under the pretext of kinship, 1152. Six months afterwards she gave her hand and her possessions to Henry of Navarre, who in 1155 mounted the throne of England as Henry II. That the duchy of Guienne should thus become permanently annexed to the English crown was naturally displeasing to Louis, and the indirect consequence of his displeasure was protracted wars between France and England. In other respects, the marriage had unhappy consequences. The infidelities of Henry, and the special favors he showed to one of his mistresses, so greatly aroused Eleanor's jealousy that she incited her son Richard to rebellion, and also intrigued with her former husband to get him to lend his influence to the great league formed against Henry in 1173. Her son had fled to Louis, and she was preparing to follow him when she was arrested and placed in confinement, where she remained till the death of her husband, 1189. As soon as he died she regained her liberty, and reigned as regent until Richard's arrival from France. She also held this position during Richard's absence in the Holy Land, for which he left in 1190. After his escape in 1194 from the captivity which befell him as he was returning home, she retired to the abbey of Fontevrault, where she died. There is a curious story told of Eleanor by Higden, monk of Chester, relating to one of Henry's mistresses known as "Fair Rosamond," of whom the queen was extremely jealous. Higden says: "She was the fayre daughter of Walter lord Clifford, concubine of Henry II., and poisoned by queen Eleanor, A.D. 1177. Henry made for her a house of wonderful working, so that no man or woman might come to her. This house was named Labyrinthus, and was wrought like unto a knot in a garden called a maze. But the queen came to her by a clue of threddle, and so dealt with her that she lived not long after." From *Encyclopædia Britannica*, 9th ed.

ELEATIC SCHOOL. The group of ancient Greek philosophers so called begins with Xenophanes of Colophon, who settled in Elea, a Greek city of lower Italy (whence the name), and includes Parmenides and Zeno, who both belonged to Elea, and also Melissus of Samos. The most flourishing period of this philosophy falls from 540 to 460 B.C. In opposition to the physical philosophy of the Ionic school, and to the doctrine of Heraclitus (q.v.), who denied all being or existence, the Eleatic philosophers made this conception of pure being, unmixed with all marks or properties derived through the senses, the foundation of all their speculations. As being, one and unchangeable, seemed to them to exclude all plurality and alteration of appearances, they gave up, with remarkable consistency, all attempts to explain scientifically the world as we see it; and the startling abruptness of their simple fundamental principle, taken in conjunction with the opposite doctrine of Heraclitus, was one of the chief causes that led Plato at a later period to attempt a reconciliation between the notions of *being* and *becoming*, or of absolute existence and phenomena.

ELEATIC SCHOOL, a sect of Grecian philosophers during the century preceding the Peloponnesian war, 530–430 B.C., deriving its name from Elea (or Velea), a city on the western coast of southern Italy, founded 540 B.C., by the Phocæans. The general characteristic of the school was the maintenance of a distinction between the apparent and the intellectual universe, between transient phenomena and everlasting truth. It includes the pantheistic idealism of Xenophanes and Parmenides, and the skeptical materialism of Leucippus and Epicurus. Consequently there are two divisions of the school. I. *The Eleatic proper;* II. *The Epicurean.* The former asserted the divine unity to be the origin and essence of all things; the latter confined its attention to the earthly and material side of the problem, not denying the immaterial and spiritual, but renouncing it as unattainable: the former disregarded the sensible elements, the latter the divine. But neither denied what it renounced. This article is concerned only with the former, or the Eleatic school proper. The shadowy character of its philosophy makes it difficult of determination, and only a few fragments of its writings remain. Its principal expounders must be taken as representatives of its different phases: 1. XENOPHANES, 618–522 B.C., of Colophon, in Asia Minor, emigrated to Sicily and perhaps to Elea. His philosophical views were given in his poem "On Nature," fragments of which remain, but not sufficient to afford a clear exhibition of the whole. He seems to have held an idealism obscure, imperfect, and conflicting. He adopted the conception of Pythagoras, that there must be an ultimate term of being which is not the visible universe but the divine intelligence. He denied that anything could have a beginning, or could become what it had not always been. But if nothing begins or becomes, then all things are an eternal unit. The unity of the Godhead is asserted against polytheism, and the individuality of the Deity against the dualism of conflicting forces. The substantial reality of the visible world is denied; God and the universe are made one. The divine essence is unchanging, eternal, infinite. The actuality of sensible facts is admitted; the reality of them is denied. They are shadows of the eternal. All things are incomprehensible, certain knowledge is impossible; the eternal and the divine are unintelligible and truth unattainable. Xenophanes anticipated geology, contributing to science the beginning of the modern investigations. He held to the periodical destruction of the world by water, as Parmenides, who followed him, did to its destruction by fire. With all the contradictions and errors of his system he is to be honored as among the first to introduce into Greek philosophy elevated conceptions of the grandeur, glory, and sovereignty of a divine intelligence. 2. PARMENIDES, born, probably at Elea, about 536 B.C., was a disciple of Xenophanes, to whose views he gave a more logical development. Fragments only of his own statements remain, which have to be supplemented chiefly from the attacks of his adversaries. Aristotle commends him for his clearness of thought, and asserts concerning him that, "looking up to the whole heavens, he declared the one only being to be God." Yet, in improving the forms of his system he perhaps injured its substance; for his starting-point seems to have been not the infinite intelligence, but the abstract conception of being. He shows clearly the conflict between the judgments of the senses and the conclusions of the reason. The essence of his scheme is the contradiction of entity and nonentity. What is cannot be non-existent; but everything that is exists. And, as nothing can proceed from non-existence to existence, all existence is eternal and unchangeable. All changes and motions are appearances only. Being is indestructible. In these speculations one cause of confusion and extravagance was the use of ambiguous and vague language. This defect showed the necessity of precise terms and of valid arguments. It thus prepared the way for logic. 3. ZENO, unquestionably a native of Elea, was the pupil, friend, and defender of Parmenides. His method of setting forth his views led to great changes in philosophy, among which were the questions of Socrates, the dialectics of Plato, and the organon of Aristotle. He is the inventor of regular logical methods, though Aristotle claims for himself that while his predecessors had provided only the forms of reasoning, he had created the art. But while Zeno gave greater clearness to the views of Parmenides by his logical precision, he also made their errors and dangers more manifest. He arrayed reason against experience, and led the way for the sophists. 4. MELISSUS, of Samos, though not directly connected with the Eleatic philosophers, is numbered among them, because of the similarity of many of his views. He confined his attention chiefly to the negative aspects of the system, denied the reality of visible things, and thought it inconsistent to ascribe time, change, or limitation to the solitary existence. He seems to have thought that knowledge of God is impossible: and in his conception of him, as Aristotle said, inclined towards materialism. The Eleatic school proper was thus verging towards the second or Epicurean branch. Imperfect and erroneous as it was, it nevertheless awakened men in that early age to consider the vanity of merely temporal things; exposed the fallacies of polytheism; affirmed the existence of a supreme Intelligence, omnipotent, omnipresent, infinite, and eternal; and called human reason to hold communion with the sovereign power in which all creatures "live and move and have their being."

ELECAMPANE, *Inula*, a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*, nearly allied to *aster*. The only important species is the common E. (*I. Helenium*), a native of damp meadows in the middle and s. of Europe, rather rare in Britain. This plant was formerly much cultivated for its root, which was used in

medicine, and still retains its place in the pharmacopœias, although comparatively neglected. The root has a faint aromatic odor; and a bitter, acrid, and somewhat camphor-like taste. It acts as a gentle stimulant to the organs of secretion, promotes expectoration, and is diuretic and sudorific. It contains a peculiar principle called *inulin*, which resembles starch, but is deposited unchanged from its solution in boiling water on its cooling, and gives a yellowish instead of a blue color with iodine; also another peculiar principle called *helenin*, or *elecampane camphor*, which resembles camphor in some of its properties.

ELECTION denotes, in theological language, the divine act by which certain individuals are chosen to salvation in Christ, and the doctrine of election is the doctrine of "God's everlasting purpose, whereby He hath constantly decreed by his secret counsel to deliver from curse and damnation those whom He has chosen in Christ out of mankind, and to bring them by Christ to everlasting salvation as vessels made to honor." These words, taken substantially from the articles of religion of the church of England, may be said to represent, in a moderate form of expression, the orthodox doctrine on the subject of election. Besides this form of the doctrine, there is a lower and a higher form of it, which, apart from technical and polemical language, may be said to spring—the one from the supposed subordination of the divine act or purpose to the divine foreknowledge of human conduct—the other from the exaltation of the divine act or purpose into an absolute and arbitrary supremacy, having no relation whatever to human will or conduct. The former of these extremes corresponds to the Pelagian or Arminian doctrine of election, the latter to the hyper-Augustinian or Calvinistic. The Arminian aims to condition or limit the absolute character of the divine act in redemption in some way or another; the Calvinist aims to give to this act the most arbitrary and irresponsible character. The one, while not altogether repudiating a doctrine of election, yet gives such prominence to the human conditions of the elective purpose, as (in the view of Calvinists) to destroy it altogether; the other maintains not only a doctrine of election or predestination, but also the correlative doctrine of reprobation. In the view of the Arminian, salvation is within the choice of the human will; in the view of the Calvinist, the human will is of little or no account—the decree of God is everything—and this decree (which Calvin admitted to be a "*decretum horribile*") absolutely determines some to everlasting life and some to everlasting death. The separation has its source in the will of God, and not in the moral conditions of mankind.

It is obvious, in the mere statement of such views, how audaciously theology has sought to settle questions beyond all human scrutiny and settlement. In the nature of things, the relations between the divine and human will appear indeterminable; and, notwithstanding all the labor of inquiry devoted to such subjects in the past history of opinion, it cannot be said that any advance of thought has been made regarding them. If the mere logic of the question be kept in view, the Calvinistic opinion has the advantage over the Arminian—setting out, as it does, from the recognition of the divine will as absolutely supreme, and the source, consequently, of all subordinate action—a thought which is in the highest degree logically consistent. But then the moral perplexities which arise out of the practical application of this view, and the ease with which it may be perverted into a fanatical and dangerous error, will always repel many minds from its adoption.

Although the expressions election, elect, etc., are frequent in Scripture, it cannot be said that what is known as the theological doctrine of E. was acknowledged by the Christian church till the time of Augustine. The Greek fathers confined their attention almost entirely to questions purely *theo*logical—that is to say, relating to the character and constitution of the Godhead. Gnosticism and Arianism, the two main forms of heretical opinion before Augustine, indicate the channels into which theological discussion had previously run. It was not till the Latin mind had taken up this discussion, that the more practical question of the relation of the divine and human will in redemption came to receive special attention. The controversy between Pelagius and Augustine in the beginning of the 5th c., brought out almost all the aspects of the question which have since, at successive epochs in the history of the church, risen into renewed prominence. The contests between the Scotists and Thomists in the 14th c., between the Arminians and Calvinists, and, within the Roman church, between the Jansenists and Molinists in the 17th c., are recurring expressions of the same radical conflict or divergency of opinion. The spirit of modern theology is adverse to the logical disputations engendered by such discussions, and finds its more appropriate and useful field of labor in the province of critical and historical inquiry.

ELECTION, in law, the choice between alternating and incompatible rights or claims; as when an insurance company, according to the terms of its policies, elects whether it will pay in cash for property insured and destroyed, or replace the same in kind and value. This right of alternative choice is of special importance in equity practice, in which instances are constantly occurring.

ELECTION, in politics, is the choice of public officers by popular suffrage, in distinction from "appointment" of those in a lower by those in a higher grade. Popular elections were not unknown in ancient times and in the middle ages. The system has had a slow development in England, and has been imitated and improved by other

countries. In the United States, elections are of three grades—1. Local or municipal; 2. State; 3. National. State elections are for executive and legislative, and sometimes for judicial officers. National elections are held once in two years for the choice of members of congress, and once in four years for the choice of electors of president and vice-president of the United States. Elections are also sometimes held for the adoption or rejection of state constitutions or of amendments of the same. The provisions for local, municipal, and state elections are made in each state by the legislature thereof. The arrangements of national elections are made in part by state and in part by the national authority, the latter being supreme within its sphere, defined by the constitution.

ELECTION COMMITTEE. See PARLIAMENT.

ELECTION LAWS. See PARLIAMENT.

ELECTION OF SCOTTISH PEERS. See PARLIAMENT, PEER.

ELEC'TORAL COMMISSION, the body of men provided for by act of Congress, Jan. 29, 1877, to settle certain disputed questions in regard to the electoral votes of several states in the presidential election of 1876. The commission was composed of 5 senators, chosen by the senate; 5 members of the house of representatives, chosen by that body; and 5 associate justices of the supreme court, 4 of whom were designated by the act of congress, and the fifth selected by the four. The senate at the time was controlled by the republican party, the house of representatives by the democratic party, and there was thought to be danger of civil commotion in regard to certain questions likely to arise in the counting of the electoral votes of the several states in presence of the two houses. In these circumstances, a majority of each of the two political parties in congress, acting in a spirit of patriotism honorable to themselves and the country, agreed to create a commission to be constituted as above described, to which should be referred for judgment and decision the question which of two or more conflicting certificates received from any state of the votes cast by the electoral college of such state for president and vice-president in the election of 1876 was the certificate provided for in the constitution of the United States: the judgment of said commission in any matters referred to it, unless set aside by the concurrent action of the two houses of congress, was to be final. The proposed law was thereupon enacted, and in conformity with an understanding between the two political parties, the senate appointed 3 republicans, and 2 democrats, and the house of representatives 3 democrats and 2 republicans as members of the commission. Of the 4 associates of the supreme court who were named in the law, 2 were understood to be democrats and 2 republicans; and these selected, as the fifth associate justice to serve with them upon the commission, Mr. Justice Bradley, a republican. The commission was constituted as follows: Justices Clifford, Strong, Miller, Field, and Bradley; senators Edmunds, Morton, Frelinghuysen, Thurman, and Bayard; and representatives Payne, Hawton, Abbott, Garfield, and Hoar. Justice Clifford, by seniority of appointment to the bench, was by law president of the commission. As the counting of the electoral votes in the presence of the two houses of congress proceeded according to custom, it was found that there were conflicting certificates from four different states—Florida, Louisiana, Oregon, and South Carolina; and the two houses were unable to agree in either case which certificate should be received as genuine. The certificates and accompanying papers were therefore successively referred to the commission, who proceeded to hear argument upon the questions involved. The result in each case was a decision of the commission, by a vote of 8 to 7—the vote following the exact line of party division in the body—that the certificate of the electoral votes cast for Hayes and Wheeler, the republican candidates for president and vice-president of the United States, was the certificate which contained the lawful electoral vote of said state, and that the other certificates were illegal and void. The republican senate concurred in this judgment in each case, while the democratic house of representatives dissented. The decision of the commission, therefore, according to the terms of the statute, became irrevocable, and the said electoral votes were counted accordingly; and Rutherford B. Hayes and William A. Wheeler were found duly elected, by a majority of one electoral vote, respectively president and vice-president of the United States for the term of 4 years, from the 4th of Mar., 1877. The controlling question before the commission was whether an electoral certificate being in form confessedly according to law, it was competent for congress or the commission to go behind the same and take evidence *aliunde* in support of alleged irregularities and frauds committed before such certificate was issued. Upon this question the democrats in congress and in the commission took the affirmative, while the republicans took the negative. The reasons of the latter for taking this ground were clearly set forth in the reports of the majority of the commission to the two houses in congress upon the matters referred to that body.

ELEC'TORS, in the German empire, were those great princes who had the right of electing the emperor or king. In the earliest times under the Carlovingians, the crown was hereditary; afterwards, Germany became formally an elective monarchy, but the election was practically almost limited to the reigning family. Under the emperor Charles IV., the right of election became limited to the holders of the highest ecclesiastical and civil offices, some of which gradually became hereditary, and connected with territorial principalities, as in the case of the Hohenstaufens and of the dukes of

Bavaria, Saxony, Suabia, etc. Thus there arose seven E., those of Mayence, Treves, and Cologne (as being the chief primates and chancellors of the empire), the E. of the Palatinate and of Bavaria long exercising the right by turns, and the E. of Brandenburg, Saxony, and Bohemia. From 1400 to 1708, the right was never exercised on the part of Bohemia, but otherwise no change took place from the middle of the 14th c. to the peace of Westphalia. By the peace of Westphalia, an eighth electorate was established, Bavaria and the palatinate being each allowed the full right; and in 1692, a ninth was added, that of Brunswick-Lüneburg, but not without resistance by the E. and states of the empire, so that the new electorate was not fully recognized till 1710. In 1777, the number was again reduced to eight, the elector palatine inheriting Bavaria. The E. held a high and very peculiar position in the German empire. The Golden Bull describes them as "the seven pillars and lamps of the holy empire." They had certain important rights and privileges. They were leagued from the year 1338 for the maintenance of their freedom of election against the pope. They had royal dignities, only not the title of majesty. The territories belonging to their electorates were indivisible.

The peace of Luneville, in 1801, made a great change in the German empire, and subsequent changes took place during the times of French ascendency, which issued in the dissolution of the ancient German empire. The title of E., used by the prince of Hesse-Cassel, an electorate which was added along with other new electorates in 1802, was the last relic of the old dignities, and was merely nominal even before 1866.

ELECTORAL CROWN, or, more properly, CAP, was a scarlet cap, turned up with ermine, which was worn by the E. of the empire. It was closed with a demicircle of gold, covered with pearls, and on the top was a globe with a cross on it, also of gold.

ELECTRA, daughter of Agamemnon and Clytemnestra, and sister of Iphigenia, Chrysothemis, and Orestes. Clytemnestra and her children were famous for their crimes and sorrows, and fill a large place in Greek poetry and drama. The *Electra* of Sophocles is one of the great dramas of antiquity. Electra married Pylades, the close friend of her brother Orestes, and became the mother of Medon and Strephon. Others of the name E. appear in Greek mythology.

ELECTRIC BELLS. The ringing of bells is not a recent application of electricity, but it is only a few years since electric bells have been placed in many public and private buildings instead of the well-known bell hanging arrangement with wires and cranks. We have not space here to discuss the merits of the two systems; suffice it to say that the use of electric bells is spreading, and that for the purpose of communicating at some distance these are the only kind available. The arrangement required to ring an electric bell, or system of bells, is simple. Some form of galvanic battery requiring little attention is placed in any convenient place, and from it an insulated wire with the necessary branches is conducted to the various rooms, thence to perhaps as many bells, and finally back to the battery to complete the circuit. Each single bell is rung in this way; beside it is fixed a break consisting of a small electro-magnet by which a spring is attracted and released in rapid succession as long as a thus continually broken current of electricity is passing. On this spring a small hammer or knob is so placed that it strikes the bell as it oscillates to and fro. In every room which communicates with a bell there is a "press-button" or little spring by which the current of electricity is put off or on as we may wish. It acts in the same way as if we were to cut the wire to stop the current, and then bring the ends of the wire together again to continue it and so ring the bell. It will continue to ring only as long as we hold the ends together.

ELECTRIC CLOCK. The regularity of the clock depends, as is well known, on the action of the pendulum, which is isochronous—that is, has the property, within certain limits, of describing long and short arcs in the same time. See PENDULUM. The pendulum, however, left to itself, would, in consequence of the resistance of the air, and of the spring on which it hangs, soon come to rest. An impulse must therefore be given it occasionally, to keep it going. This impulse need not necessarily be exactly the same, for though it might cause the pendulum to make a longer swing at one time than at another, the time of oscillation would not differ. In ordinary clocks, these impulses are given by a heavy weight, and are transmitted to the pendulum through the wheel-work of the clock. No moving power can be more steady than gravity, or less likely to tax the isochronism of the pendulum, but its action on the clock is limited by the distance through which the weight descends, so that the weight must be periodically wound up, to keep gravity in play. The trouble of winding, though small, still leaves room for the wish that a clock might be constructed going for long periods without external help. Such an instrument the E. C. professes to be; but an independent E. C. is not trustworthy as a timekeeper, and all that electric clocks are used for is to copy the time of a good gravity clock. This work the E. C. does to perfection. The E. C. was invented by Bain, an Edinburgh clock-maker, in 1840, and his ideas, though improved and modified, still form the basis of electric clock-making. In the ordinary clock, it is the clock that moves the pendulum; in Bain's clock, it is the pendulum that moves the clock. As the construction of the pendulum is the only part of it connected with electricity, we shall confine our notice to a general description of the pendulum action. To the lower part of the pendulum a bob is attached, consisting of a hollow bobbin of insulated copper wire. Wires from both ends ascend the pendulum-rod, and

are in metallic connection respectively with the two springs from which the pendulum hangs. Two magnets, or bundles of magnetic rods, are fixed at either side of the bob, and are of such dimensions that the hollow bob in its oscillation can pass a certain way over each without touching. The magnets have their like—e.g.—south, poles turned towards each other. The two springs of the pendulum-rod are in connection with the two poles of a galvanic battery. The wire connecting one of them is made to pass round by a break, worked by the pendulum-rod. When the pendulum is made to move, say towards the right, it shifts a slider, so as to complete the connection between the poles of the battery. The current thereupon descends one of the wires of the pendulum, passes through the coil of wire forming the bob, and ascends by the other. In so doing, it converts the bob into a temporary magnet, the s. pole towards the right, and the n. pole towards the left. In this way, the s. pole of the bob is repelled by the s. pole of the right-hand magnet; and its n. pole is attracted by the s. pole of the left-hand magnet, so that from this double repulsion and attraction, both acting in the same direction, the bob receives an impulse towards the left. Partly, therefore, from this impulse, and partly from its own weight, the pendulum describes its left oscillation; and when it reaches the end of it, it moves the slider so as to cut off the battery current, and then returns towards the right, under the action simply of its own weight. On reaching the extreme right, as before, it receives a fresh impulse; and thus, under the electric force exerted during its left oscillation, the motion of the pendulum is maintained. So long as the electricity is supplied, will the pendulum continue to move. The current required is exceedingly weak, and Bain considered that it could be sufficiently excited by a plate of copper and a plate of zinc sunk into the ground, and acted upon by the moisture usually found there. This earth-battery, as he called it, was expected to act steadily for years; but the result proved far otherwise, for the soil not unfrequently dried up, leaving no trace of electrical action. The imperfection of the battery has led to a strong prejudice against these clocks—stronger, certainly, than they merit. Practice has, however, established that a clock driven by an electric pendulum, under no control, is not to be trusted, and clocks of this kind, so far at least as this country is concerned, are entirely abandoned. The next important step in perfecting the E. C. was made by Lewis Jones (patented 1857). All his clocks are ordinary gravity clocks. The standard clock is not an E. C. at all, but its pendulum makes and breaks contact in the battery circuit which controls the copying clocks. These last, though driven by weights, have Bain's pendulums, and the currents transmitted by the standard clock keep them oscillating in exact accordance with it, so that the standard clock and copying clocks have their pendulums always at exactly the same point in their oscillations. The copying clocks are adjusted to keep nearly the time of the primary, and the margin of error is wholly removed by electric control.

There are now two rival systems of electric clocks in this country—one invented by Wheatstone, patented 1869, and "exploited" by the British telegraph company; the other invented by Ritchie, clock-maker, Edinburgh (patented 1872).

Wheatstone's primary clock is a gravity clock with a pendulum bob like Bain's, with fixed magnet or magnets coincident with the arc of the pendulum. When the bob is driven by the weights of the clock from the one end to the other, a current is induced in the coil of the bob, according to the well-known principles of magneto-electricity (q.v.). When the bob returns, a current is created in the opposite direction. The copying clocks or dials have a mechanism similar to Wheatstone's step-by-step telegraph, and each oscillation of the primary pendulum, by generating a current, drives them one step onwards. The pendulum of the primary clock, along with the magnets, is a magneto-electric machine driven by the weight of the clock, and moving all the copying clocks. The work the pendulum has to do, however, interferes with its isochronism, and hence the primary clock has to be kept under the control of a standard clock by an ingenious contrivance. Ritchie takes advantage of the important feature of Jones's system, viz., that of having a standard clock free from all electric impulses, an ordinary astronomical clock whose pendulum only makes and breaks contact in a galvanic circuit. Thus all the perfection of clock-making is fully utilized. The standard clock, as in Jones's system, is placed in circuit with the copying clocks. But here his system differs. Instead of having weights and a train of wheel-work in the copying clocks, he has simply a Bain's pendulum driving an escapement (also patented) similar to Bain's original clock. The mechanism is thus simple and cheap, and each clock has got in its pendulum a store-house, so to speak, of individual energy under electric maintenance and control, and cannot without a grave accident be put out of order. It is inferior to Wheatstone's system in having battery power to maintain. But this does not cost much. From 3 to 5 Daniell's cells will work a copying clock in any part of the same town, and need only to be renewed once in six months. Ritchie's system is in some respects more trustworthy than Wheatstone's. The delicate action of the step-by-step motion is liable to accidental derangement. Now Ritchie's sympathetic clock has a heavy pendulum, and can be used in public dials to withstand even the action of the wind on the hands. Again, there is no need of a magneto-electric clock and a standard clock. The standard clock does all. The perfect success of Ritchie's system has been proved in Edinburgh and elsewhere. In Edinburgh, several public clocks on the sympathetic system have been in action for some years, and have not varied a second. The success of Ritchie's system is much indebted to an invention of Edward Sang, by which the length of the suspend-

ing spring of the standard pendulum can be altered, and the rate of the clock regulated without stopping it. Ritchie in 1864 also patented a magneto-electric system which, however, he has never worked.

ELECTRIC COLUMN, or DRY BATTERY; invented by De Luc. It is formed by a great number of alternating disks of paper, silver leaf, and zinc leaf. When the air is very dry it will hardly work; but under ordinary atmospheric conditions it generates a feeble current.

ELECTRIC FISHES. See ELECTRICITY, ANIMAL.

ELECTRICITY, the name used in connection with an extensive and important class of phenomena, and usually denoting either the unknown cause of the phenomena or the science that treats of them. Most of the phenomena in question fall under the three chief heads of frictional electricity, galvanism, and magneto-electricity. The present article is confined to the first.

Historical Sketch.—Thales, about 600 B.C., refers in his writings to the fact that amber, when rubbed, attracts light and dry bodies. This was the only electric fact known to the ancients. The science of E. dates properly from the year 1600 A.D., when Gilbert of Colchester published a book, entitled *De Arte Magnetica*, in which he gives a list of substances which he found to possess the same property as amber, and speculates on magnetic and electric forces. He is the inventor of the word E., which he derived from the Greek word *electron*, amber. Otto von Guericke, burgomaster of Magdeburg, in his work *Experimenta Nova Magdeburgica* (1672), describes, among his other inventions, the first electric machine ever made, which consisted of a globe of sulphur turned by a handle, and rubbed by a cloth pressed against it by the hand. Hawksbee (1709) constructed a machine in which a glass cylinder, rubbed by the dry hand, replaced Guericke's sulphur globe. Grey and Wehler (1729) were the first to transmit E. from one point to another, and to distinguish bodies into conductors and non-conductors. Dufay (1733–45) showed the identity of electrics and non-conductors, and of non-electrics and conductors, and was the first to discover the two kinds of E., and the fundamental principle which regulates their action. Between the years 1733 and 1744, much attention was given in Germany to the construction of electric machines. Up to this time, notwithstanding the inventions of Guericke and Hawksbee, the glass tube rubbed by a piece of cloth which Gilbert first introduced, was used in all experiments. Böze, a professor at Wittenberg, taking the hint from Hawksbee's machine, employed a globe of glass for his machine, and furnished it with a prime conductor. Winkler, a professor at Leipsic, was the first to use a fixed cushion in the machine. The Leyden jar was (1746) discovered accidentally at Leyden by Muschenbroek; but the honor of the discovery has been contested also in favor of Cuneus, a rich burgess of that town, and Kleist, canon of the cathedral of Camin, in Pomerania. Franklin (1747) showed the electric conditions of the Leyden jar, and (1752) proved the identity of lightning and E. by his famous kite experiment. The last was performed with the same object about the same time, and quite independently, by Romas of the town of Nerac, in France. In 1760, Franklin made the first lightning-conductor. Canton, Wilke, and Æpinus (1753–59) examined the nature of induction. Ramsden (1768) was the first to construct a plate-machine, and Nairn (1780) a two fluid cylinder-machine. The electrophorus was invented by Volta in 1775, and the condenser by the same electrician in 1872. In 1786, Galvani made the discovery which led to the addition of the new branch to the science which bears his name, and which now far exceeds the older branch in extent and practical value. See GALVANISM. In 1787, Coulomb, by means of his torsion-balance, investigated the laws of electric attraction and repulsion. In 1837, Faraday published the first of his researches on induction. Armstrong, in 1840, designed his hydro-electric machine.

Fundamental Facts.—Under the head Conductors (q.v.) it is stated that bodies which do not conduct E., or non-conductors, are capable of electrical excitation from friction, and are, in consequence, termed electrics, and that conductors not so affected are called non-electrics. The *fundamental principles* of electricity are illustrated by the *electric pendulum*. A glass tube bent at right angles, so as to project horizontally, is placed on a convenient stand. On the hook in which its upper end terminates, a cocoon thread is hung, to the end of which a pith-ball is attached. The ball is thus doubly insulated by the glass and the silk thread. If a tube of glass be rubbed by a dry silk handkerchief, and brought near the ball, the ball is at first briskly attracted, and then as briskly repelled; and if the tube be then moved towards it, it moves off, keeping at the same distance from it. The ball being so affected, or charged, as it is called, a rod of shellac or of sealing-wax, after being rubbed with flannel, attracts it, if possible, more briskly than before, and again sends it off exactly as the glass had done. If the glass tube be now again taken up and rubbed a second time, if necessary, the ball will act towards it as it did towards the sealing-wax. The same series of attractions and repulsions would have taken place if we had begun with the sealing-wax instead of the glass tube. We interpret this experiment in the following way: When glass is rubbed with silk, and the silk removed, it is charged with what is called positive electricity. The ball is attracted by it, and becomes on contact also charged with positive E., and is then repelled. When sealing-wax is rubbed with flannel, and the flannel removed, it becomes charged with negative E., which is the counterpart of positive E., for it attracts the positively charged ball, and communicating its own E. to it, finally repels it. From

such an experiment as this, we conclude *that bodies electrified either positively or negatively, attract neutral bodies and bodies affected with E. of an opposite name to their own, but repel those affected with E. of the same name; and that E. can be communicated from one body to another by contact.* For positive and negative (written also + and −), the terms vitreous and resinous are also employed, as glass and resin are the typical substances from which they may be obtained. Contact is not the only way in which E. is communicated. We find, when we deal with larger bodies than the pith-ball of the experiment, and sometimes even with it, that the passage of a *spark* between two bodies without contact communicates the E. of the one to the other. The part played by the rubbers in the above experiment must not be overlooked. The silk handkerchief employed to rub the glass assumes the resinous or − electrical state, and the flannel rubber of the sealing-wax the vitreous or +. This cannot, however, be clearly shown, as the experiment is performed, for the rubbers are in each case tightly embraced by the hand, which neutralizes their peculiar electricity. We can perform our fundamental experiment in a way clearly to show this. Let us take for our rubbing and rubbed surfaces two india-rubber balloons inflated with air (such as children play with), and hold them tightly one in each hand. They may be in all respects perfectly alike. Let us then rub them briskly on each other, and then hold the rubbed sides closely together. On bringing the two in contact near the pith-ball, it remains indifferent to them; but if we pull them apart, and put one on each side of the pith-ball, the ball plays actively between them, being attracted and repelled by each in turn. The fact of no attraction occurring when the balloons are together, shows that in the rubbing both electricities are generated in equal quantities, for they neutralize each other when brought near; and the fact that the balloons must be separated proves that all electric phenomena take place in an electric field, with positive E. at its one termination, and negative E. at its other. The non-conducting nature of the india-rubber prevents the electricities finally neutralizing in contact, and disappearing by the hands when apart. It is also instructive that as force is exerted and work is done in pulling them apart, we have the equivalent of that work in the form of an electric field capable of doing work. The motion of the pith-ball, and the heating caused by the tiny sparks which charge it, are evidences of the truth of the statement. It is again worthy of note that both balloons appear exactly alike, and yet they assume opposite electricities. That there must be some difference may be drawn from the next paragraph.

In most cases of friction, the nature of the rubbing and rubbed surfaces determines the kind of E. which each assumes. Thus, if glass be rubbed by a cat's fur instead of silk, its E. is − instead of +. In the following list, each body, when rubbed by any one preceding it, is negatively electrified; by any one succeeding it, positively: cat's fur, smooth glass, linen, feathers, wood, paper, silk, shell-lac, ground glass. When two pieces of the same material are rubbed together, the colder or smoother becomes positively excited. Metal filings rubbing against a plate of the same metal determine − E. in themselves, and + E. in the plate. When a white silk ribbon is rubbed by a black one of the same texture, the white one becomes +. A plate of glass becomes + when a stream of air is directed against it from a pair of bellows. The friction caused by steam of high tension issuing from a narrow pipe develops electricities in the steam and pipe which depend on the material of the latter. This fact has been turned to advantage by Armstrong in the construction of a boiler electrical machine of immense power.

Induction.—Free E. has the power of inducing the bodies in its neighborhood to assume a peculiar electrical condition; this is exhibited in the following simple way: A brass cylinder, rounded at both ends, is insulated on a glass pillar. Two pith-balls, hung by cotton threads, are attached at either extremity. When a glass tube is briskly rubbed, and placed within a few inches of the end of the cylinder, the balls at each end diverge, showing that each pair is charged with similar electricities. When the glass tube is withdrawn, the balls hang down as before, so that the electrical excitement of the cylinder is merely temporary, and dependent on the proximity of the excited tube. If, while the balls are apart, a *proof plane*, consisting of a small disk of gilt paper insulated at the end of a glass rod, be made to touch the end next the tube, and then transferred to an electrometer, the E. is found to be −; if the same be done at the other end, it is +. The nearer end of the cylinder is thus induced by the + E. of the glass to assume the negative electric state; and as no − E. can be excited without as much + E., we find the other end positively electrified to the same extent. It appears, besides, from the positions taken up by them, that *both electricities observe the same attractions and repulsions as the bodies affected by them.* This action of the E. of the tube inducing in the cylinder this peculiar electrical condition, is called induction; and the cylinder in this state is said to be *polarized*—that is, to have its poles or ends like a magnet, each having its similar, but relatively opposite force. If the hand touch the cylinder, the balls next the tube diverge further than before, and the other two cease to be affected. In this case, electrically speaking, the cylinder is a portion of the ground, for the hand and body are conductors; the ground is thus brought nearer, more − E. appears, and the + E. is lost in the spark with the hand. The − E. is kept fixed in the part of the cylinder opposite the tube by the + E. of the latter; and when the hand is first removed, and then the tube, it causes the balls at both ends to diverge permanently. We thus see that E. can be produced and insulated in conductors by the action of free E. on them. The + E. of the further half of the cyl-

inder is as free and insulated as if no − E. existed within it. This is shown by placing a cylinder near the first, forming a continuation of it, as it were, without touching, when the second cylinder, under the induction of the + E. of the first, is thrown into the same state as the first. This second can induce the same state in a third, and so on. As the excited tube is withdrawn, the whole series return to their natural condition without being in any way permanently affected. The moment, however, it is again brought near, there is manifested at the further termination of the last a + E., which exerts the same influence there as if a portion of the E. of the tube had been actually communicated or transferred to it.

The air intervening between the tube and the cylinder is termed the *dielectric*, for it is through it that the electric action is propagated. In proof of this, we have only to place a cake of shellac between the tube and cylinder, when the polarity of the cylinder will rise higher than before, as would be shown by the further divergence of the balls; and if this or a similar experiment be conducted with sufficient care, we find that the inductive action varies in amount for each non-conductor. Induction, therefore, we have reason to conclude, is not the direct action of one body on another, but an action transmitted through, or possibly residing in, the medium between them. In further proof of this, Faraday, who was the first to examine the function of the dielectric in induction, has shown that the action takes place through air in curved as well as in straight lines, which implies the action of an intervening medium. The relative powers of different substances in facilitating induction, are termed by this philosopher *their specific inductive capacities*. The following table by sir W. S. Harris gives the specific inductive capacities of the more important non-conducting substances, taking that of air as unity: Air, 1.00; resin, 1.77; pitch, 1.80; beeswax, 1.86; glass, 1.90; sulphur, 1.93; shellac, 1.95; india-rubber, 2.8. All gases, whether simple or compound, have the same inductive capacity, and this is not affected by temperature or density. If a large plate of metal be placed between the glass tube and the cylinder, the polarization of the cylinder instantly vanishes, for the induction is diverted by it into the ground.

Theory of Induction.—Faraday, taking for granted that the dielectric is the essential medium of induction, suggests that the molecules of air and other dielectrics are conducting, but that they are insulated from each other. We have already seen that by induction, part of the E. of an insulated body can be in effect transferred to a surface at some distance from it, without any loss experienced by the exciting body. If, now, we could imagine a series of insulated cylinders diverging in all directions from the glass tube, we have reason to expect that the whole of the E. of the tube would be in effect transferred to their outer extremities without loss of E. to the tube. To prove that such would be the case, Faraday took a pewter ice-pail, 10½ in. high, and 7 in. in diameter, and insulated it, placing the outside of it in conducting connection with the knob of a gold-leaf electroscope. An insulated ball, charged with + E., was then introduced into it without touching. The pail was thus subjected to polarization, the − E. being on the inner, and the + E. on the outer surface. The divergence of the leaves increased as the ball was lowered, until it sunk 3 in. below the opening, when they remained steadily at the same points. The ball was lowered till it touched the bottom, and communicated its charge to the pail, when the leaves remained in the same state as before, showing that the + E. developed by induction on the outer surface was exactly the same in amount as that of the ball itself. He then altered the experiment so as to have four insulated pails inside each other, and the effect on the outmost pail was in no way altered. Here the action of the air between the pails was in effect the same as that of the pails themselves, and if the molecules of air were insulated conductors like these, they would have acted in no way different from what they did. The action of the molecules of air, in certain circumstances, appears to favor the idea that they are individually conducting. The discharge of E. by spark through the air, shows that they can be forced to act as conductors; and the currents which proceed from points highly charged with electricity, appear to indicate that they can be attracted and repelled like the pith-balls of our first experiment.

Conductors, according to this theory, are bodies whose molecules have the power of communicating their electricities to each other with great ease, whilst non-conductors are those whose molecules only acquire this power under great force. Wheatstone has shown, as we shall afterwards see, that facility of discharge is not perfect even in the best conductors, as time is needed for its propagation, and it has been found that the terminal laminæ of non-conductors between two charged plates become penetrated with opposite electricities, which indicates the slow progress of conduction. The molecules of conductors and non-conductors, therefore, have the same power of mutual discharge, but in very different degrees, so that a good non-conductor may be regarded as an excessively slow conductor.

Potential, Density, Tension, Capacity.—Some idea of the meaning of the word *potential* may be got from the following comparison. Suppose we have a supply of water with a certain head, to fill an elastic bag: when the water is admitted, the bag will swell till the elasticity of the bag is equal to the head of water, and then the flow will cease. The potential is the head of water or elasticity of the bag, so many feet high, or so many pounds per square inch. The capacity of the bag is usually the amount it holds, but capacity in an elastic bag is a shifting quantity, and we must use the term in this way

if we wish to compare the capacity of two elastic bags—viz., the ratio of the water it holds to the head that filled it. Thus, a bag holding 10 galls., with a head 1 ft., would have a 10 times greater capacity than a bag holding 10 galls. with a head 10 ft.; for if the first were pressed by a head of 10 ft., it would hold 100 galls., the resistance of the bag being supposed to increase with its contents. Now, let us take a somewhat similar electric problem. An insulated ball is connected with a magazine of energy, ready to make E. flow when occasion offers, such as a galvanic battery. Let the + pole of a gigantic battery be connected with the ball, and the other pole with the ground, E. will flow to the ball till the air between the ball and the ground presents an electric reaction equal to the potential of the battery. The charge of the ball taken with reference to this potential gives the capacity of the ball. So much, then, for a popular view of these two words. The potential of a body, or any point in the field, is defined thus—viz., *the amount of work that would be expended in bringing a small quantity, a unit of + E., from an infinite distance to the body or point.* If the body is positive, the work would be expended; if negative, the work would be done on the body and the potential −. The said unit of + E. will always move from a point where the potential is high to one where it is lower; in other words, E. will always flow between two points where there is a difference of potential, and will cease to flow when that difference ceases. If E be charge, V the potential, C the capacity, then $C = E \div V$. From the definition of potential just given, what we have called the potential of the battery in the preceding illustration is in reality its *electro-motive force,* or the difference of potentials of its poles. As these are alike in power, but different in sign, and as the difference of two quantities of unlike sign is their sum, the electro-motive force is twice the potential of one pole. If the charging line be withdrawn, the ball will be in all respects as if charged by an electric machine. The battery having, so long as it acts, an unlimited supply of E., its electro-motive force remains the same; but when balls charge one another, the potential falls just as when a limited supply of water has its head reduced when made to run into another vessel. Potential, then, must be estimated by the resistance of the field, or the work value of the unit of charge. The charge being the same, the potential rises with the smallness of the body, or the thickness of the dielectric. Density is the quantity of electricity on a unit of surface, and *tension* is the strain which Faraday supposes to exist in the molecules of a dielectric when charged. Tension is commonly used in this country and abroad for potential, though our best writers never use it now in this sense.

Distribution of Electricity.—We might take it almost as a self-evident truth, that the greater the surface over which E. is diffused, the less is its electric potential at any particular point, and so we are taught by experiment. When two equal balls are insulated, and a charge is given to one of them, and then communicated to the other by contact with the first, it is found that both equally divide the charge, but that the potential of the E. of each is one half of that of the originally charged ball. When a watch guard-chain is charged and laid on the plate of an electroscope by means of a glass rod, the gold leaves diverge most when the chain lies in a heap on the plate; and as it is lifted up, the leaves approach each other, showing that as the exposed surface of the chain increases, the electric potential of each part diminishes. The reason of this is obvious. Let us begin with one ball with a certain charge, then take another equal ball and impart half the charge to it by making the two touch. A spark will be seen at the charge of the second ball. The quantity in both is still the same, but energy has been lost by the spark, and the heat generated by the spark is the measure of the loss. If we continue to add ball after ball until we have a very large surface, the quantity is the same as at first, but energy has been squandered in the sparks of each additional ball, and so the potential is lowered.

Experiment teaches us, that E. is exhibited only on the surfaces of conductors. A brass ball is suspended by a silk thread, and covered with two hemispheres, which can be held by insulating handles, and which exactly fit it. A charge is then communicated to the ball so compounded. When the hemispheres are withdrawn, they are found to take away all the E. with them, not the slightest charge being left in the ball. The same fact is exhibited by a hollow ball placed on a glass pillar, with a hole in the top large enough to admit a proof plane to the inside. When charged, not the faintest evidence of E. is found on the inner surface, however thin the material of the ball may be. The thinnest metal plate, when under induction, shows opposite electricities on its two faces. We learn from these and numerous other experiments, that *electricity is only found on the outer surfaces of conductors in an envelope of inappreciable thickness.* This fact is quite in keeping with Faraday's theory of the action of dielectrics. Within a conducting body we cannot expect E., for the moment it appears in it, the particles communicate their electricities to each other, and the electric state ceases. In a dielectric they cannot communicate, and the charge remains. Hence the charge at the conductor only appears at the junction of a conductor and dielectric.

We are also taught by experiment that the distribution of E. on the surface of insulated conductors is influenced materially by their form. An electrified ball, for example, exhibits the same density all round, for the resistance is sensibly the same on all sides of it. When, however, a conducting body is made to approach near enough to it, the density of the E. is found to be greater on the side on which the approach is made. This is proved by the aid of a proof plane and an electrometer. When work is done in drawing away the proof planes from the charged body, its potential, as tested by the

electrometer, is proportional to the density of the charge at the point where it touched. The reason of this unequal distribution is obvious, from the fact that the potential of the ball must be the same at every point. If, therefore, the resistance at one side be less than at another, the density there must be greater to maintain equality of potential. The disturbance of equal distribution here spoken of holds true only for short distances; the disturbing body, for instance, in the case under consideration, has to be brought very near before any inequality in the distribution of E. on the ball becomes manifest. It is to this concentration of E. on the side of the approaching conductor that we owe the electric spark; and it is as we near the striking or sparking distance that this disturbance is revealed. The concentration or fixing of E. on the side of the thinnest and best dielectric, is particularly illustrated in the condenser (q.v.) and Leyden jar, whose action depends upon it; but in these the dielectric must be very thin to secure decided effect. When a conductor somewhat in the form of a prolate spheroid is charged, and the electric density of the several parts tested by the proof plane, it is found to be least at the thickest part, and to increase towards either end; and the difference is found to be all the greater as each end becomes more and more pointed. It is found likewise that the electric density on a point is so great with a considerable charge as to destroy the dielectric condition of the air, the particles of which become electrified, and carry by convection the charge of the point to surrounding conductors. We therefore learn that *E. concentrates on points and projections.* A similar reasoning with regard to the relations of potential resistance and consequent density bears here as in the previous case. It may be here remarked that the density of charge at any point regulates the amount of tension at that point on the molecules of the dielectric. The constraint which they experience in being charged, and which Faraday calls tension, can only be carried to a certain limit. When that is reached, the molecules are forced to be conducting, and the tension ceases.

Electrometers and Electroscopes.—These words are generally taken as synonymous; electroscopes, however, should be applied to the instruments which give evidence of electrical potential without giving the exact measure of it; and electrometers to such as show both. Of late years, immense progress has been made in the construction of delicate electrometers, chiefly to meet the demands for such in the working or testing of submarine cables. Sir William Thomson's quadrant electrometer and his absolute electrometer, in point of exactness and delicacy, are a hundred-fold in advance of previous instruments. We shall here, meanwhile, describe the common forms of electric indicators. The *quadrant electrometer* consists of a conducting-rod, generally of box-wood or brass, with a graduated semicircle attached above, in the center of which is a pivot for the rotation of a straw carrying a pith-ball at its outer end. It is used for a charge of high potential, such as that of the electric machine. When placed on the prime conductor of the machine, the whole becomes charged with + E., and the ball is repelled first by the E. of the rod, and then by that of the prime conductor, the height to which it rises being seen on the semicircle. This is not an electrometer in the strict sense of the word, for although it tells us, by the straw rising and falling, when one potential is greater or less than another, it does not tell us by how much, the conditions of its repulsion being too complicated for simple mathematical expression. It can show us, however, by the indicator standing at the same point, when the electric potential of the machine is the same at one time as another.

The *gold-leaf electroscope* is a handy instrument for estimating roughly medium potentials. In one of the best of its forms a glass ball, about 4 in. in diameter, rests on a brass tripod, and its neck, about 1 in. in diameter, is inclosed by a brass collar fixed with shellac. A brass plate, with a hole of $\frac{1}{4}$th of an in. in diameter in the middle of it, can be screwed air-tight into the collar. Before it is so fitted, a brass rod, $\frac{1}{4}$th of an in. in diameter, is fixed by shellac or sealing-wax into the hole in the middle, so as to be perfectly insulated from it. The upper end of the rod ends in a brass ball, and the lower end is filled on each side, to allow of two strips of gold-leaf, 1 in. in length, being attached to it. Before the plate and leaves are finally fixed, the interior of the ball is thoroughly dried, by passing hot dry air into it, so that the ball contains no moisture to carry away the charge of the leaves. When the plate is screwed to the collar, there is no communication between the included and external air. The insulation of the leaves is complete; and they keep their charge, in dry weather, for hours together. When the instrument is used, it may be charged directly, by contact being established with the ball and the body whose E. we would examine, or a charge may be carried to it by the proof plane, when the leaves diverge according to the charge communicated. When we would ascertain simply the kind of E. with which a body is charged, we proceed in the following way: A glass tube is rubbed, and brought into the neighborhood of the brass knob; the leaves diverge by induction, and, when so diverged, the knob is touched with the finger, and the leaves fall to their original position, for they are then out of the line of action. In this state, — E. is fixed by the action of the + E. of the tube on the side of the knob next it, and the corresponding + E. is lost in the ground. When the finger is removed, the + E. is cut off, while the — E. remains in the knob; and its presence is manifested by the leaves diverging permanently after the removal of the tube. If, now, a positively electrified body be brought near the knob, it draws away the — E. from the leaves, and they consequently fall in; but if a negatively electrified body be brought near, it sends the — E. more to the leaves, so that they

diverge further. We are thus enabled to distinguish between a + and a − charge. But it may be asked, why not charge the electrometer immediately with the glass? There are two difficulties in the way of this. If the glass is powerfully electrified, it gives too great a charge; and if feebly, contact between the knob and the glass cannot be effected, although its E. acts powerfully by induction. We therefore bring the glass rod near the electrometer, and when the leaves diverge sufficiently, we touch the knob with the finger, and withdraw first the finger, then the rod, and the leaves diverge as before. For the more delicate use of the gold-leaf electroscope, see CONDENSER.

Coulomb's Torsion Balance has played an important part in examining the laws of electric forces. A glass canister is placed on a wooden frame, and is covered above by a plate of glass or wood; in the middle of this plate a round hole is cut, over which is fixed, by wooden fittings, a long glass tube having the graduated rim of a circle attached at its upper end. A circular plate, resting on this rim, closes the upper end of the tube; and when it is turned round, a mark upon it tells the number of degrees through which it has been moved. A cocoon thread or very fine wire is tied to a hook in the center of the lower side of this plate, and thence descends to the body of the canister. It carries below a collar of paper or other light material, in which a needle of shell-lac is adjusted having a disk of gilt paper placed vertically, or a gilt pith-ball at its one end, and a counterpoise at its other. When the plate above is moved through any number of degrees, the needle below, impelled by the torsion of the thread, comes to rest at the same number on the scale below. This last consists of a strip of paper divided into degrees, pasted round the cylinder at the same height as the needle. In the cover of the canister there is another opening, for the admission of a ball insulated at the end of a rod of shell-lac, and which, when supported by the cover, is on a level with the paper disk of the needle. When the instrument is adjusted for observation, the mark on the upper plate and the paper disk stand each at the zero-points of their respective scales, there being of course no torsion in the thread. The ball is removed, to receive a charge from the body under investigation, and is then placed in the cylinder, when the disk is first attracted, then repelled. Suppose that the disk be driven 40°, as shown by the lower scale, from the ball, and that the upper plate has to be moved in the opposite direction, through 160° of the upper scale, to bring it back to 10°, the total degree of torsion is $160° + 40° = 200°$. If the ball and disk be now discharged, and another charge be given to the ball, which requires 250° of torsion to place the disk at 10°, we have the relation 200 to 250, as that of the repulsive forces of the two charges, for the amount of torsion in degrees is proportional to the twisting force. Without entering further into detail, we may state the two laws that Coulomb established by this instrument: *The intensities of the mutual repulsion or attraction of two invariable quantities of electricity of the same or different names, are in the inverse ratio of the squares of the distance at which these act. The intensities of the total repulsive or attractive action of two electrified bodies placed at an invariable distance, are proportional to the products of their electric charges.*

Electric Machine.—In the tube of glass and silk rubber of which we have made frequent mention, we have the embryo of the electric machine, viz., a body which, when rubbed, is positively electrified, and its rubber negatively. The first requisite we should expect in a *machine* of this nature is a large surface, to give a great amount of electricity. But there is another already casually referred to: glass being a non-conductor, the E. formed on its surface has not a combined action, so that some arrangement is necessary to collect it, and render it available—to act, in fact, as its conducting reservoir. This portion of the machine is denominated the *prime conductor*. The rubbed surface of the electric machines is either a cylinder or plate of glass; hence we distinguish them into cylinder machines and plate machines. The former, from their more compact form, are the more manageable; and the latter, from both sides of the glass plate being rubbed, are the more powerful forms of the instrument. The description of Winter's plate machine (fig. 1) will be quite sufficient to show the general requirements and construction of electric machines. It is one of the best existing forms of the machine. The glass plate is turned on the axis *ab* by means of the handle *c*. The longer end of this axis, consisting of a glass rod, moves in the wooden pillar *d*, and the other rests in the wooden head of the glass pillar *e*. The plate is thus completely insulated, and little loss of its E. can take place through its supports. The two rubbers are triangular pieces of wood, covered with a padding of one or two layers of flannel, inclosed in leather, and they present a flat hard surface to the glass, so that friction between it and them takes place in every part. They are placed in a wooden frame on each side of the plate, and the

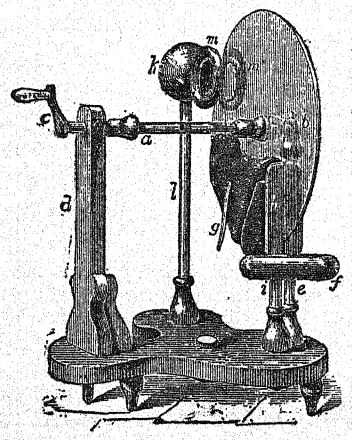

FIG. 1. Electric Machine.

pressure is regulated by metal springs, fixed to the outside between them and the frame. Before use they are covered with an amalgam of mercury, zinc, and tin, which is made to adhere with the aid of a little grease, and which increases immensely the production of electricity. The surfaces of the rubbers are therefore conducting, and are made to communicate by strips of tinfoil with the *negative conductor, f* (fig. 1). To limit the electric field in the neighborhood of the negative conductor, or, which is the same thing, to keep the potential of the glass from rising too high, so as to cause a discharge back into the rubbers, each rubber has a non-conducting wing fastened to it, which is made of several sheets of oiled silk, kept together by shellac varnish, beginning at the rubber with several, and ending with one or two sheets. When the machine is in action, electrical attraction makes them adhere to the plate; but when it is out of action, they may be kept up by a split pin *g*. As the plate turns, the rubbers are kept in the frame by their ledges *h*. The whole frame-work of the rubbers and negative conductor is supported by the short glass pillar *i*, so that it can be insulated when required. The prime conductor, *k*, is a brass ball insulated on the long glass pillar *l*, and to prevent the edges of the ball at the junction dissipating the E., the pillar enters the ball by a trumpet-shaped opening. The collection of the E. from the glass is made by a row of points placed in the grooves, inside of two wooden rings, *m*, *m*, which are attached on each side of the plate to a piece of brass projecting horizontally from the ball of the conductor. The grooves are covered with tinfoil, which conveys the collected E. to the ball, and the points are kept out of the way of injury by not projecting beyond the grooves.

There are four openings in the prime conductor: the lower one for the head of the supporting pillar; the one at the right for the attachment of the collecting apparatus; the one at the left for the stalk of a small brass ball; and the upper one for admitting the lower end of a large wooden ring, removable at pleasure. This last forms the peculiar feature of Winter's machine. It consists of a bent iron wire carefully covered all round with polished wood, and communicating by a brass pin at the foot of the stalk, on which it stands with the prime conductor. To receive the sparks from the machine, an appendage termed the spark-drawer is provided. This consists of a wooden pillar of the same height as the prime conductor, in the head of which a brass rod slides, with a large flat ball at the one end and a small ball at the other. All the fittings of the machine are of wood, no metal being used but for the prime and negative conductors. On using the machine, it is first necessary to connect the negative conductor by a wire or chain with the ground. As the plate is turned, — E. is developed on the rubbers, and led to the negative conductor; and + E. is formed on the glass, which is collected by the points, and transferred to the prime conductor. If the negative conductor be insulated, the electric field would be limited to the space between the negative and prime conductors; but when uninsulated, the floor and walls of the room form part of it, and the field now lies between the prime conductor and any surrounding object. If — E. is wanted, the negative conductor is insulated, and the prime conductor connected with the ground, when sparks of — E. are given off by the negative conductor.

The various forms of *electric discharge* through the air, or, as it is termed, *disruptive discharge*, can be well seen with Winter's machine. The negative conductor being connected with the ground, with a two-foot plate, we may observe them in the following order. On turning the plate once or twice, a faint snapping sound is heard, and, when the room is darkened, a flickering spark is seen to be thrown out from the two-inch ball projecting from the prime conductor, which has the form of a bush, without leaves, with trunk, branches, and twigs, about 10 in. in height. This is one form of what is called the *brush discharge*. Its general direction is horizontal, or not much inclined from it, but it turns to the hand or other flat conductor brought near it. If it be received on a ball, its various branches concentrate on it. If the brush proceed from the end of a brass rod, instead of from a ball, it becomes very much diminished in size, and resembles a brush of feathers. The brush discharge, though apparently continuous, has been found by Wheatstone to consist of a series of successive brushes. When discharge is effected from a point, a star or *glow* of light marks its termination, while strong currents of air proceed from it, which are strong enough to blow away the flame of a candle. These currents accompany more or less the various forms of the brush-discharge. The particles of air thus carry away the charge from a point to surrounding conductors, and hence a point is said to discharge itself by convection. If we connect the brass rod of the spark-drawer with the ground, or the negative conductor, and bring the flat ball opposite to the small ball on the prime conductor, straight brilliant sparks pass between them so long as the distance does not much exceed 2 inches. Beyond that distance, the sparks become somewhat crooked, and at about 4 in. the discharge begins to take the form of a brush. If, now, the ring be placed in the conductor, the sparks again pass with readiness, and the brush does not again take place till the ball of the spark-drawer is 11 or 12 in. off. The long sparks thus obtained with the aid of the ring are decidedly crooked or forked, with strongly marked lateral branches, which become all the more marked as they lengthen. It would thus seem that the spark has a tendency to break up into branches. When the striking distance is small, this is not perceptible; it is then straight and undivided. As the distance increases, it is crooked, with well-marked offshoots; and when the distance is too great, it splits up entirely into a bush or brush.

The ring is merely an extension of the prime conductor, and keeps down its electric density till a sufficient quantity of E. is collected, which can keep together in the form of a spark. Something similar occurs when water is driven out in spray from a small syringe, and in a jet from a large one, under an equal head. All the forms of disruptive discharge are accompanied with the peculiar electric odor which arises from the production of ozone (q.v.).

We may now make a short reference to the experiments performed by the machine, illustrative of the general properties of electricity. A wooden head with hair on it illustrates, when placed on the prime conductor, electrical repulsion, by the hair standing on end. A spoon containing ether is held so as to receive a spark from the projecting ball, when the inflammation of the ether illustrates the heat of the spark. A man standing on an *insulating stool* (a stool with glass legs), with one hand on the conductor, can send sparks, with his other hand, to everything and everybody about him. This illustrates communication of E. by contact. A few pith-balls are inclosed in a glass jar, having its top and bottom of metal—the former in connection with the prime conductor, and the latter with the ground, when the pith-balls, by their rising and falling, show the attraction of unlike, and the repulsion of like electricities. A gas-jet may be lighted by a person wholly unconnected with the machine, and standing some 8 or 10 ft. from it. If the person so situated holds the blade of a knife or other point over the gas-burner, at a distance only short of touching, at each long spark from the machine, a small spark passes between the blade and the burner, and this ignites the gas. The reason is as follows: The body of the person in question is electrified negatively by the extensive prime conductor of the machine acting inductively. When the spark passes, the electric tension of the ring falls, and the negative E. of his body must return to the ground, and taking the easiest route, causes the spark in question. This is quite similar to what is known in thunder-storms as the *back-stroke*. A person in a prominent position, under a highly-charged cloud, experiences a violent, sometimes fatal shock at the same time as a flash of lightning, although the flash was not at all near him.

Induction Machines.—In frictional machines there are two ways in which energy is expended—in friction, and in drawing away the two excited and attracting surfaces. Much of the force expended in friction results in heat, and only a fraction (sometimes a small one) in electricity. Of that spent in drawing away which is the less considerable, the whole results in increased potential. Machines are therefore very desirable where, with a small initial charge, a constant supply of electricity may be got by the latter method. The electrophorus (q.v.) is a machine of this kind, and has been known since 1776, and Nicholson's doubler, another, since 1788. But the action of these has only been on a small scale. Lately, however, induction machines of great power have been made, the powers of which quite eclipse the older frictional machines. The best known of these is Holtz's machine (invented 1865), which will suffice to show the general construction of such.

Holtz's machine consists of two glass disks, A and D (fig. 2), of very thin glass carefully covered over with shellac varnish. The one, D, is somewhat larger than the other, A. The plate D is stationary, and is kept in its place by four circular grooved rings of vulcanite V, V, V, V, placed in horizontal glass rods, which themselves are supported by upright glass pillars *a*, *a*, *a*, *a*. By this method of support the plate D may be turned round to rest in any position. The upright glass pillars rest on the sole of the instrument, and pass through two solid blocks of vulcanite L, L', which serve to knit the whole frame well together. In L two brass rods R, R', are fixed, which, on the end next the revolving plate A, each support a horizontal row of teeth facing the plate A; and on the other, two sliding rods with vulcanite handles H, H', which can be adjusted to distance, and which form the poles of the machine. The revolving plate A is fixed in a vulcanite spindle, the ends of which move in the blocks L, L'. This plate is made to revolve at great speed by a handle and multiplying belts. It is unbroken, and revolves as close to the plate D as to keep clear of it. The stationary plate D, which is shown in fig. 3, has two holes cut in it like those at P and P'. The lower edge of the one opening, and the upper edge of the other, lie along the line of the teeth of the two poles already mentioned. On the side of the plate D, away from the revolving

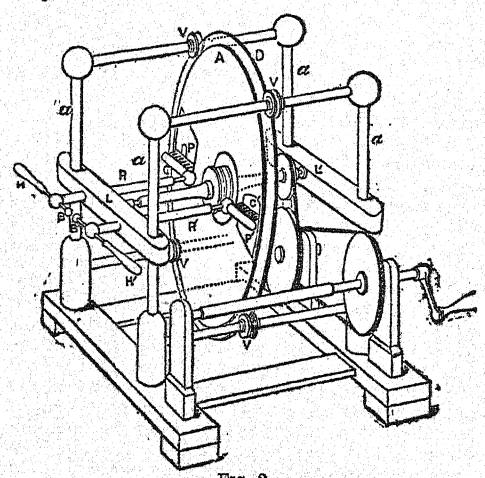

FIG. 2.

plate, are stuck two coolings or armatures of varnished paper C, C′, and from those protrude two tongues, also of varnished paper, slightly turned into the openings of the fixed plate, and towards the revolving plate. The size of the revolving plate is shown in fig. 3 by a dotted circle.

Suppose now we have to work the machine, and let us take one whose plate (a usual size) is 2 ft. in diameter. We first of all put the two poles B and B′ in contact—we see that the teeth lie opposite the line TT′, and that the revolving plate revolves in the opposite direction to the tongues P, P′, or which is the same thing, that the revolving plate passes an opening before coming to the row of teeth. We next take a sheet of vulcanite about the breadth of an armature, and rub it with cat's skin (making it —), and hold it close to the armature C, and then make the plate revolve. We at once know if the machine is working by a rushing sound. We now gradually withdraw the two balls at the poles, and a rush of straight, bright but not very dense sparks leap across between the two for the first 2 in. or so. When the distance becomes greater than that, brushes proceed from each end, and there is a fine purple glow in the central space. If we withdraw the poles to 5 or 6 in., two well-defined brushes are seen, one at each pole, the larger and most fully formed being the + brush at B′. The — brush at B′ is much smaller. If now the hand be placed on one pole and the other hand presented to the other, sparks of 2 in. are got which produce a most painful stinging sensation on the hand, but cause no twitching at the joints of the arm. When the poles are at a distance of half an inch, paper and other combustible substances may be kindled by the spark. On examination it is found that C, or the armature first touched by the excited vulcanite, is — (as shown in fig. 3), and that the other is +; that B, which is opposite C, is —, and B′ +. If the machine be viewed in the dark, long + brushes are seen at P and the tooth opposite it, and — stars at P′ and at the tooth opposite or attached to B′. The plate is + below—that is, after passing the negative armature; and — above, after passing the + armature. If the motion of the plate be reversed, the electricity of the poles changes sign or ceases altogether, when the machine must be excited anew. If kept moving in the same direction, and allowed to rest only for short intervals, it may be kept in action for hours together without renewed excitement.

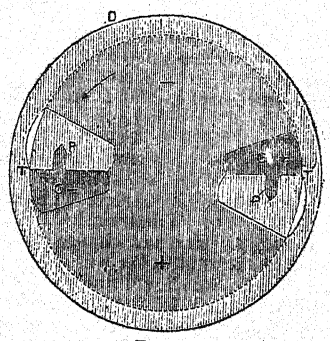

Fig. 3.

In order to get long dense sparks, a small Leyden jar is hung on each of the rods R, R′, with their outer coatings in metallic contact. With these condensers a splendid series of long, intensely brilliant sparks of 6 in. in length are got, each accompanied with a snap painfully loud, quite eclipsing anything shown by friction machines. The condensed spark does not kindle paper, but gives a very powerful shock.

We have not space to enter into the theory of Holtz's machine. Indeed it may be questioned if, in all points, its action has been fully accounted for. We would only say that reciprocal action of the armatures on each other is common to all induction machines, and is quite similar to Siemens and Wheatstone's principle for magneto-electricity (see Magneto-Electric Machines).

Leyden Jar.—This is a glass jar, with a coating of tin-foil pasted carefully inside and out, extending to within a few inches of the mouth. This last is generally closed by a wooden stopper, through which passes the stalk of a brass knob or ball, surmounting the whole. The connection between the inside coating and the ball is completed by a chain extending from the stalk to the bottom of the jar. If this jar be put on an insulating stool, so that sparks can pass from the prime conductor of a machine to the knob, when the jar is thus insulated, one or two sparks pass, and then the charge seems complete, for no more sparks will follow, though the action of the machine is continued; or if they do, they are immediately dissipated from the knob in a brush discharge. If then, however, the knuckle of the experimenter be brought near the outer coating, sparks begin again to pass freely; and for every spark of + E. that passes between the machine and the knob, a corresponding spark of the same name passes between the knuckle and outer coating. This continues for some time, and then the jar appears to be again saturated. It is now said to be fully charged. The outside of the jar can, in this state, be handled freely, and if it be still on the insulating stool, so may also the knob, although, when the hand first approaches, it receives a slight spark. But if, when the experimenter has one hand on the outer coating, he bring the other hand to the knob, before it can reach it, a straight, highly brilliant spark passes between the knob and his hand, and he experiences a shock of great violence. If he try the same thing again, a feeble spark and shock again ensue, and the jar is now thoroughly discharged. As it is highly inconvenient, if not dangerous, to discharge the jar through the body, *discharging tongs* are used for that purpose, which consist of two brass arms ending in balls, and moved on a hinge by glass handles.

A very instructive experiment may be made when the coatings are fitted to the jar

so as to be removed at pleasure. After the jar is charged, it is put on an insulating stand. The inside coating is lifted out by the knob, and a slight spark is got by the hand in doing so. The jar is now taken up by one hand, and the outside coating is removed by the other, and, as before, another feeble spark is got. The whole is now built up in inverse order and discharged, when the spark is nearly as brilliant as when it is discharged at once without such dissection. From this it may be argued that the charge of the jar lies in the glass and not in the coatings, and that it is likely that in all cases it is in the dielectric the charge resides; that the conductors, which are usually looked upon as the seat of the charge, are merely the limiting surfaces or exponents of it. A portion of the total charge may reside in them, but no more than is found on two similar contiguous dielectric surfaces. Taking this for granted, it is easy to explain the action of the leyden jar. The electrifying power of the charging machine is exerted on two dielectrics—the glass of the jar and the air—the external limit in both cases being the surrounding objects which constitute the ground. The action on the air through the inside coating or the knob is quite-similar to what we find in the case of any body to be charged. The action through the glass is peculiar, because we are shut out from it. The limits of this action are the inside surfaces of the inside and outside coatings. The air charge we participate in as we move in it. We are, however, quite external to the action on the glass; but if we could move about in it between the coatings, we should find things there exactly similar, so far, at least, as kind of action is concerned, to what we find in charged air. Seeing that the glass of the jar is a thin and good dielectric, and the air much thicker and more difficult to polarify, the charging power of the machine is exerted for the most part in the glass, the polarification in the air being comparatively slight. Assuming E. to be a polarification of molecules, the E. of the jar resides thus in glass, and to a much less extent in the air. The potential at the inner coating is the same as that at the knob, for any connected system of good conductors must be at the same potential. We judge of potential by the air charge, and thus we take the potential at the knob as the potential at the inner coating. The spark got from the knob of the insulated jar is small compared wtih that of the charging machine, and as sparking distance is, generally speaking, proportional to potential, the potential of the jar is much below that of the charging machine. Thus, a *Leyden jar is a contrivance for accumulating large quantities of electricity at a low potential.* The thinner the glass, the greater will be the accumulation of electricity, but the feebler will be the potential of the jar. When the electric field is limited, as in the glass of the Leyden jar, it is sometimes said to be *bound,* as distinguished from the *free* charge of an ordinary air field.

When the knob of the insulated jar is touched, a spark is got, and if the finger be then removed to the outer coating, another spark, but of the opposite name, is obtained, and the knob is again prepared to give a spark, and this alternating process may be continued till the jar is emptied. When the inner coating is touched, the outer coating becomes insulated, and thus the potential always shifts to the insulated coating with an opposite name to what it had before. Each spark obtained by the finger in going from the one to the other consumes so much of the energy of the charge, and so the potential is gradually lowered. When the jar is discharged by the tongs, the charge of the dielectric glass is thrown into the dielectric air. The particles of the glass, though more easily electrified than those of air, having a higher specific inductive capacity, offer a much greater resistance to discharge than those of air. At the same stage of polarification, the air gives way, while the glass still keeps polarified. Hence a jar with glass only a fraction of an inch in thickness can give rise to an air-spark of several inches; besides this, the charge in the glass is somewhat uniformly distributed. In the air, with the tongs, the force of the charge is concentrated on a certain region of it, and the breaking down of the conductive resistance of the air is more easily effected. The feeble *residual* spark from the jar, after the first main discharge, is due to what is called *electric absorption.* Somehow, the E. given to a dielectric is not immediately available when a circuit is offered, the dielectric taking some time to recover itself. This is observable in all solid dielectrics, but no trace of such action is found in air.

The sparking or *striking distance* of the jar indicates the potential of the charge. The quantity may be measured by the turns of the charging machine. It is found that when the same quantity is given to two jars, one double the other in point of covered surface, the striking distance of the large jar is only half that of the small jar; and that to charge the large one so as to obtain the same length of spark, twice the quantity must be given. If two jars be taken of the same size, and one of them be charged, we find that, on connecting their outside coatings, a spark passes when their knobs are brought together, and that, when now the double jar is discharged, the spark is only half as long as was got from the single jar discharged directly. The quantity discharged finally in the double jar was the same as in the single jar, but the potential was half. The spark occurring at the participation of the charge accounts for the loss of potential.

For great power, large surfaces are necessary. This can be obtained either by constructing a large jar, or by uniting several small jars together so as to act as one. The latter method is preferable, as we can vary the surface according to the number of jars employed. A combination of small jars united together as one is called an *electric*

battery. In a very convenient form of electric battery the knobs of each jar communicate with a large central one by means of arms of brass moving on hinges, and the outer coatings are put in conducting connection, by being placed on an insulated stool covered with tinfoil. The interior coatings are conveniently charged by a long projecting arm from the central knob, and the exterior ones by connecting the stool with the knob of the unit jar, or by a wire with the ground. Any jar can be thrown out of action by throwing back its arm.

By discharging the Leyden jar or electric battery through particular channels, we obtain some beautiful illustrations of the power of electricity. When the discharge is effected through thin wires of gold or platinum, the heat accompanying its passage is so great as to dissipate them in vapor. The expansion of the air caused by the spark is shown by the *electric mortar*. This is a wooden mortar with two wires entering air-tight at the opposite sides of the breach, with a small wooden ball fitting closely in the muzzle. The spark passing between these wires in discharge causes a sufficient expansion of the air within the mortar to drive the ball to some distance off. When the discharge is made through gunpowder, it tosses the grains violently about, but causes no ignition; when, however, it is retarded by introducing an imperfect conductor, such as a wet string, into the circuit, the gunpowder is fired. When the discharge is made through glass by two points pressing against its opposite surfaces, a small hole is drilled into the glass.

Velocity of Electrical Discharge.—The velocity of E. is found to vary with the nature of the circuit to the extent, indeed, of its inductive embarrassment (see TELEGRAPH). Thus, in air-lines of telegraph it is greater than in sea-cables. Wheatstone was the first to determine the velocity of E. in an insulated copper wire stretched in air. He did this by the device of a revolving mirror. Any one who takes a mirror in his hand and makes it revolve, sees that objects are apparently displaced by it, and that the reflected image describes an angle the double of that of the mirror. If, while the small mirror rotates at 50 turns a second, the image of a spark should show a displacement of 90°, we know that the mirror has moved through 45°, and the time during which this takes place is $\frac{45}{360}$ of $\frac{1}{50} = \frac{1}{400}$ of a second. If the duration of the spark, then, had been $\frac{1}{400}$ of a second, we should have seen its image move through 90°. The eye, however, during this time would not have been able to discern any difference between the beginning and the end of the spark, so that the 90° would have appeared as one arc of light. Examined in this way, however, the spark of a machine and of a Leyden jar were seen as if the mirror had been at rest. He arranged a Leyden jar circuit of half a mile with three breaks in it, two near the coatings, and one in the middle of the half-mile, and had these breaks placed nearly side by side, so that the sparks at them, when discharge took place, could be seen together in the revolving mirror. He found that all three sparks had a duration of $\frac{1}{2000}$ of a second, and that the middle spark occurred so far behind the other two as to indicate a velocity of 194,000 m. per second in the wire.

Electric Theories.—There are two theories which have played an important part in the history of the science—the two-fluid theory of Dufay, and the one-fluid theory of Franklin. According to the former, matter is pervaded with two highly elastic imponderable electric fluids—one, the vitreous; the other, the resinous. These are supposed to repel themselves, but attract each other. Neutral bodies give no evidence of their presence, for they are there neutralized the one by the other; but when by friction or other operation the fluids are separated, each body observes the attractions and repulsions of the fluid it happens to have. According to the latter, there is only one electric fluid which repels itself, but attracts matter. Friction determines a gain of the fluid to the positive, and a loss to the negative body. Faraday's theory of electric induction by contiguous molecules appears to be gaining ground. "It explains satisfactorily how conductors and non-conductors are alike in kind; how the charge on the conductor can only reside at the boundary of the conductor and non-conductor, or—which is the same thing—the surface of the conductor; how the charge resides *in* the dielectric; how the polarity of the galvanic circuit is effected; how a battery current originates in and effects chemical decomposition; and how the velocity of discharge is dependent on the conformation of the circuit" (*Electricity*, Chambers's Educational Course, 1867). Prof. Clerk Maxwell's classical work, *Electricity and Magnetism* (1873) gives to Faraday's views a mathematical significance and comprehensiveness hardly contemplated by the great philosopher himself.

ELECTRICITY, ANIMAL. In this article we shall notice (1) the electricity developed by the so-called electrical fishes; (2), the electric properties of muscle and nerve; and (3) the electric phenomena of membranes and glands.

1. Although the peculiar powers of the torpedo and of the gymnotus were well known to the ancients, the first scientific discovery in this department of electricity was the determination of the electrical character of the shock of the torpedo by Walsh in 1772 ("Of the Electric Properties of the Torpedo," *Philadelphia Transactions*, 1773). From that date to the present time, the electric organs of certain fishes, which will be immediately mentioned, have been made the object of special study by some of our greatest anatomists and physiologists, amongst whom may be named John Hunter, Gal-

vani, Rudolphi, Knox, Valentin, Pacini, Matteucci, Goodsir, and Jobert de Lamballe, who has published a special work, entitled *Des Appareils Electriques des Poissons Electriques* (Paris, 1858), accompanied by a magnificent volume of plates.

The species of electrical fish which has been the longest known, is the *raia torpedo*, or electric ray, which has much the appearance of a skate. It is common in the bay of Biscay and in the Mediterranean, but is seldom met with on the shores of Britain. It grows to a considerable size, and is often above 80 lbs. in weight. It is now usually regarded as not a true ray, but as constituting a distinct genus, to which the terms *torpedo* and *narcine* have been applied by different naturalists—the latter name being derived from the Greek word *narke*, which was given to it by Aristotle. The electric organs or batteries are placed on each side, in the spaces between the pectoral fins, the head and gills. See TORPEDO. Each battery consists of a number (varying according to the age of the animal) of hexagonal prisms, which extend perpendicularly between the dorsal and abdominal surfaces, and present somewhat of a resemblance in shape and arrangement to the cells of a honey-comb. Four nerves, which are branches of the fifth and eighth cerebral pairs, go to each battery; and the nervous center of the electrical apparatus is, therefore, the *medulla oblongata*. Several species of *narcine* are known, all of which possess the electric property.

The ordinary rays and skates possess an organ in the tail which closely resembles the electric organ of other fishes, but its function is still doubtful; and in opposition to the view of its electric nature, it may be mentioned that while Dr. Starke (to whom the discovery of this organ is due) found it in the tail of every species of true ray, both professor Goodsir and M. Robin ascertained it to be wanting in the tail of the *torpedo*.

The *gymnotus electricus*, or electrical eel, is little inferior in celebrity to the *torpedo*. It is common in all the streams which flow into the Orinoco, and is generally procured from Surinam. It is usually 3 or 4 ft. in length, but may reach a length of 6 feet. The whole of its viscera lie close to the head, and the anal aperture is only 2 in. behind the mouth; all the rest of the body inferiorly is occupied by the electrical apparatus, which consists of four batteries—viz., two on either side, and one above the other—the uppermost or dorsal being the larger. These batteries consist of a number of piles placed horizontally in a direction from head to tail; and from this circumstance, as well as from their peculiar structure, they were compared by Redi to galvanic troughs. The number of these piles in the greater battery, is from 30 to 60; in the lesser, from 8 to 14. These batteries are supplied by about 224 pair of nerves on each side, derived from the inferior or motor roots of the spinal nerves.

Humboldt, both in his *Personal Narrative* and in his *Views of Nature*, gives a graphic account of the mode in which the Indians catch wild horses through the agency of the gymnotus. Faraday made numerous observations on a specimen, 40 in. in length, which was exhibited in the Adelaide gallery some years ago. He calculated that, at each medium discharge, the animal emitted as great a force as the highest charge of a Leyden battery of 15 jars, exposing 3,500 sq.in. of coated surface. The strongest shocks were obtained by touching the fish simultaneously near the head and near the tail; scarcely any shock being felt if the hands be placed one on each side of the fish, at the same distance from either extremity; the amount of the shock, as might have been expected, varying with the length of the column which produces it. The shocks have sufficient power to stun, or even to kill fish; and the same discharge produces a more powerful effect upon a large fish than it does upon a small one, since the larger animal exposes a larger conducting surface to the water, through which the electricity is passing, and, consequently, it receives a more violent shock. On one occasion, when a live fish was put into the tub, which was 46 in. in diameter, the animal was seen to coil itself into a semicircle, the fish lying across the diameter; this was the most favorable position for giving the strongest shock; an instant afterwards, the fish floated dead upon its side, and was then devoured by the *gymnotus* (q.v.).

The shock of both the *torpedo* and the *gymnotus* gives rise to momentary currents of sufficient intensity to deflect the galvanometer, to magnetize a needle, and to decompose iodide of potassium; and from both fish, sparks have been obtained.

We next come to the electrical fishes of the genus *malapterurus*. The only fish of this genus whose electrical organs have been examined and described is the *M. electricus* of the Nile, called raash or thunder-fish by the Arabs. It has barbules dependent from the region of the mouth, like the common barbel; and its smooth skin is diversified with irregularly shaped spots. Its length is from 8 to 14 inches. The batteries are two in number, "separated," to adopt prof. Goodsir's description, "but at the same time intimately connected to one another in the mesal plane along the dorsal and ventral margins of the body, so as to form a continuous layer of a gelatinous consistence closely adherent to the skin, and inclosing as in a sac the entire animal, except the head and fins." The structure of these batteries is very complicated, and we shall not attempt to explain it.

In the year 1854, a new electrical fish became known to us, belonging to the same genus as the one just described. It is found in the muddy brackish water of the river Old Calabar, which empties itself into the bight of Benin. The fish has accordingly

been named the *malapterurus Beninensis* by Mr. Andrew Murray, who has described and figured it in the *Edinburgh Philosophical Journal* for July, 1855. It is much smaller than the Nilotic species, and the formulæ of the number of fin-rays differ in the two species. We believe that this new species was dissected by the late prof. Goodsir, but we are not aware that the results were ever published. See MALAPTERURUS.

Our limits will not allow of our noticing the successive opinions which have been entertained regarding the action of the electric organs in fishes. Those of our readers who wish to investigate this abstruse subject may be referred to prof. Goodsir's memoir, "On the Present State of Organic Electricity," in the *Edinburgh Philosophical Journal* for Oct., 1855. We cannot conclude our notice of electric fishes without directing the attention of our readers to an extremely interesting memoir by the late prof. George Wilson, "On the Electric Fishes as the earliest Electric Machines employed by Mankind," which is contained in the *Edinburgh Philosophical Journal* for Oct., 1857, in which he discusses (1) the antiquity of the practice of using the electrical fishes as remedial agents, and (2) the extent or generality of that practice.

2. The study of the electrical properties of muscle and nerve dates from the period (1786–94) in which Galvani made his great discoveries. Having first ascertained that contractions were produced by electricty in the muscles of a recently killed frog, he subsequently found that similar contractions occurred when two dissimilar metals in contact with one another were brought in contact with the nerve and muscles respectively of the frog's leg. The experiment may be readily made in the following manner: Expose the crural nerve of a recently killed frog; touch it with a strap of zinc, and at the same time touch the surface of the thigh with one end of a bit of copper wire. At the moment that the other end of the wire is brought in contact with the zinc, the limb is convulsed; but the convulsions cease when the two metals are separated from each other, though they are still in contact with the animal tissues; and they are renewed when the zinc and copper are again made to touch. At first, Galvani believed that the contractions were due to electricity evolved by the metals, but finally he concluded that it is produced by the animal textures themselves. No important step in this direction was afterwards taken till 1827, when Nobili, with his improved galvanometer (q.v.), discovered the electric current of the frog. He found that when the circuit of the nerve and muscles of the leg is closed by the instrument, a deviation of the needle, to the extent sometimes of 30°, occurs, due to a current which passes in the limb from the toes upwards, and which could be increased when several frogs were simultaneously included in the experiment. Undoubted proof was thus afforded that electricity is developed in connection with muscle and nerve.

The researches of Matteucci, confirmed by the subsequent investigations of Dubois Reymond, have demonstrated the existence of what is termed *the muscular current* in living animals. They show that in the living animal an electrical current is perpetually circulating between the internal portion and the external surface of a muscle—a current due probably to the chemical changes which are always occurring in the animal tissues. This muscular current ceases in warm-blooded animals in a very few minutes after their death; but in cold-blooded animals, as in the frog, it continues for a much longer period. The following is perhaps the best experiment for showing the existence of the muscular current: Five or six frogs are killed by dividing the spinal column just behind the head; the lower limbs are removed, and the integuments stripped off them; the thighs are next separated from the legs at the knee-joint, and are cut across transversely. The lower halves of these prepared thighs are then placed upon a varnished board, and so arranged that the knee-joint of one limb shall be in contact with the transverse section of the next, and thus a muscular pile is formed, consisting of ten or twelve elements; the terminal pieces of this pile are each made to dip into a separate small cavity in the board, in which a little distilled water is placed. If the wires of a sensitive galvanometer be attached to a pair of platinum plates, and these plates be placed simultaneously, one into each cavity in connection with the muscular pile, a deviation of the galvanometer needle will be observed in a direction which indicates the existence of a current passing from the center or cut transverse surface of the muscle towards its exterior.

Dubois Reymond has subsequently shown, by the use of extremely sensitive instruments, that even the smallest shreds of muscular tissue exhibit proof of the existence of such a current; and he has established the general law, that any point of the natural or artificial *longitudinal* section of a muscle is positive in relation to any point of the natural or artificial *transverse* section.

3. The electrical relation of membranes and glands have been especially studied by Mr. Baxter, whose "Experimental Inquiry, undertaken with a View of ascertaining whether any or what Signs of Current Electricity are manifested during the Organic Process of Secretion in Living Animals," is published in the *Philosophical Transactions* for 1848 and 1852.

His chief conclusions regarding the electrical condition of the intestinal mucous membrane are:

1. When the electrodes of a galvanometer are brought into communication—one with the mucous membrane of the alimentary canal, and the other with the blood flow-

ing from the same part—a deviation of the needle takes place, indicating that the mucous secretion and the blood are in opposite electrical states.

2. The effect ceases after death, and may be considered as arising from the decomposition of the blood—viz., from the changes which occur during the formation of the secreted product and venous blood.

His conclusions regarding the electrical relations of the secretions and blood of the liver, kidney, and mammary gland, are as follow:

1. During biliary secretion, the bile and the venous blood flowing from the hepatic veins are in opposite electrical states.

2. During urinary secretion, the urine and the venous blood flowing from the renal vein are in opposite electrical states.

3. During mammary secretion, the milk and the venous blood flowing from the mammary veins are in opposite electrical states.

For further information on this subject, the reader is referred to Matteucci's *Lectures on the Physical Phenomena of Living Beings*, translated by Dr. Pereira; to his series of "Electro-Physiological Researches," published in the *Philosophical Transactions;* and to Dubois Reymond's *Untersuchungen über Thier-Electricität.*

ELECTRICITY, MEDICAL. Electricity, in its application to medicine and surgery, is employed in the following forms: 1. *Electrization*, by electricity of high tension, as obtained by friction of glass in the common electrical machine; 2. *Galvanization*, by current electricity of quantity, as set in motion by the voltaic battery; and 3. *Faradization*, by induced or interrupted currents, produced by magneto-electric or electro-magnetic induction coil machines.

Electrization.—Frictional electricity is now seldom employed in therapeutics, on account of the inconvenience experienced in the management and insulation of the glass or common electrical machines; yet the powerful stimulant and counter-irritative effect of sparks drawn from the affected parts is still recommended in paralytic affections, in chorea and other nervous diseases; and the succussion produced by shocks from the Leyden jar is undoubtedly the most effectual remedy in amenorrhœa.

Galvanization.—The effect of passing a voltaic current from a battery of many elements through the living body, is to cause a shock or contraction of the muscular tissues, succeeded with a distinct interval by a momentary sensation or flow of heat due to the electric and nervous (?) polarization of the circuit. During the continued passage of the current, slight tingling sensations and elevation of temperature are observed, especially in those parts in contact with the electrodes or poles, which become painful and congested, and finally inflamed and ulcerated. On opening the circuit, the depolarization of the tissues which ensues is accompanied by a second shock and subsequent glow of heat, which are powerful in proportion to the length of time the circuit has remained closed. The amount of contraction in the muscle has relation to the *intensity* rather than the *quantity* of electricity passed through it—that is, to the rapidity with which the electric state is changed, rather than the amount of that change. The calorific effect of the current is proportionate to its *quantity.* Thus, a single pair of plates of platinum and zinc, an inch square (charged with chromic acid), will, under ordinary circumstances, exercise little or no physiological effect; but if the same pair be divided, so as to form a compound battery of twelve smaller pairs, its application will be attended with the shocks and calorific effects described. A further division into 24 or more pairs increases the shock, but the sensation of heat becomes less marked. With certain limitations, therefore, the shock of the battery depends on the number of its elements, without regard to their size, its calorific effect to the area of its plates. The nerves of the organs of special sense, when subjected to galvanization, evidence phenomena peculiar to their proper function. Thus, the passage of the current through the retina is attended by the sensation of a flash of light, which is bluish when the positive pole is applied to the eye, and tinged with the complementary orange when the force is transmitted in the opposite direction. A faint sensation of light is also perceived when the skin of the face or mucous membrane of the mouth is galvanized, caused by reflex action from the sentient filaments of the fifth pair of nerves which are distributed to those parts. Galvanization of the ear gives rise to bubbling, ringing, or cracking sounds, and occasionally to distinctly musical tones; that of the tongue, to an acid taste under the positive pole, and an alkaline taste under the opposite one; that of the lining membrane of the nose, to sneezing and a peculiar smell, which differs with the direction of the current. The continuous gentle action of small single and compound voltaic arrangements has been more or less successfully employed in paralysis, amaurosis, and neuralgia, either by application to the surface of the body, or carried directly to the affected parts by needles thrust into them (galvano-puncture). More powerful batteries, consisting of six or eight cells of the carbon battery of Bunsen, the nitric acid battery of Grove, or the platinized zinc battery of Strethill Wright, have been used to coagulate the fibrinous contents of aneurismal sacs—to decompose calculi in the bladder (?)—and to render platinum plates or wires incandescent, for the surgical cauterization of internal parts not otherwise easily accessible.

Faradization.—The instruments employed for the exhibition of interrupted or induced

currents are the magneto-electric and the electro-magnetic coil machines. In the first, the electricity is set in motion in a long thin wire coiled round a bar of iron or keeper maintained in constant whirling motion before the poles of a permanent horseshoe-magnet, the magnet with every half revolution magnetizing the keeper alternately in opposite directions, while the constantly recurring magnetism of the keeper in its turn induces impulses of alternating currents in the coil-wire. The disadvantages of the magneto-electric machine, therefore, are, that it is not self-acting, and that its currents pass alternately in opposite directions. In the electro-magnetic machine, the thick coil-wire, wound over a core of iron, is made to conduct the current from a single voltaic pair which magnetizes the iron. When the battery-current is interrupted, the iron core becomes instantly demagnetized, and this change in its magnetic condition is attended with a rearrangement of the polarity of the coil-wire, and the passage through it of an impulse of induced electricity. By a simple arrangement, the magnetized iron is made to interrupt and renew the battery-current; and the machine thus rendered self-acting, furnishes a rapid succession of momentary currents passing in the same direction, and of much greater quantity than those of the magneto-electric machine. Currents higher in tension, less in quantity, and more resembling frictional electricity, may be obtained from an additional coil ("secondary coil") of very thin and long wire wound over the former one, but they are not of much importance in medical practice.

The physiological action of the coil-machines is equivalent to that of rapidly repeated discharges from a large Leyden jar weakly charged; and as the time engaged by the passage of each impulse in the succession of discharges is too short to permit the development of any decided polarization of the tissues, the distinct calorific effects which accompany the commencement and cessation of the *galvanic* discharge do not occur. The continued passage of the interrupted currents acts chiefly as a mechanical stimulant, first exciting, and after a time depressing the vitality of the part in the circuit; and its effects have been very closely imitated by vibratory impulses, produced altogether irrespective of electrical agency.

Faradization is applicable to a great variety of chronic diseases in which a deficiency of functional energy exists; in paralytic affections unconnected with active disease of the nervous centers, mercurial and lead palsy, and in that produced by rheumatic affection and exposure to cold; in nervous or hysterical aphonia, or loss of voice; in amaurosis (q.v.), when not connected with inflammatory or organic disease; in nyctalopia, or night-blindness; in amenorrhœa, when uncomplicated with active disease of the uterus; in suppression of the lacteal secretion; in constipation (q.v.) from deficiency in the peristaltic action of the intestines; in paralysis of the bladder (?), and with very doubtful effect in the induction of uterine contraction; in suspended animation from drowning, narcotic poisons, etc. In spasmodic and neuralgic diseases, the benefit of faradization is less to be depended on; but a very gentle and long-continued application of it has afforded relief in the distressing starting of the lower limbs which occurs in paraplegia or paralysis of the lower half of the body; in "writer's cramp," and spasmodic forms of hysteria; in tic-douloureux, sciatica, and hysterical neuralgia. Faradization by electro-puncture has been successfully employed to induce the union of non-united fractures, the currents being passed between the disjoined ends of the bones; and to excite absorption in bronchocele and hydrocele, though with more doubtful effect. The intense sparks from the "secondary coil" have been used in place of those obtained by frictional electricity; and lastly, it has been proposed to employ the brilliant streams from powerful induction coils confined in fine "vacuum tubes" of glass, to illuminate internal parts of the body, for the performance of surgical operations, etc.

ELECTRIC LIGHT. All known methods of generating electricity can produce light of greater or less steadiness and brilliancy. Cavallo, in his treatise published a century ago, refers to a light, different from the electric spark, produced by frictional electricity. A needle or wire presented to an insulated person, at the distance of about 1 in. from his body, while he is actually rubbing the tube, will, he says, exhibit a lucid pencil of rays, seemingly issuing from the point and diverging towards the person; and other like experiments are described by Watson and other early writers. Light from battery electricity was first discovered by sir Humphry Davy at the royal institution, London, in 1810, when, on the continuity of a current from 2,000 cells being broken, a brilliant light was seen. To this the name of the "voltaic arc" was given, and the points where the current was broken were termed "electrodes." An early and simple arrangement for producing this light consisted of two carbon-points fixed into hollow brass rods, which are connected with the battery by wires entering at binding screws. The rods slide in the heads of glass pillars. The wires from the battery being connected, the points are made to touch, and are then withdrawn a line or two, when a dazzling light appears, approaching the light of the sun in purity and splendor. Its intensity prevents the naked eye from examining its form, but this may be ascertained by projecting the images of the points on a screen, when it is no longer painful to the eyes. The light is partly due to the incandescence of the tips of the carbon, and partly to an arch of incandescent particles extending from the one to the other. The positive pole is brightest and hottest, as may be proved by intercepting the current, when the positive

pole continues red for some time after the negative pole has become dark. During the maintenance of the light, a visible change takes place in the condition of the poles, and the positive pole becomes blunt by the loss of particles of carbon. The wasting away of the poles renders the distance between them too wide to allow of the passage of the current, and the light is thus suddenly extinguished, until again renewed by contact and removal. The heat of the *voltaic arc* is very intense. Quartz, the sapphire, magnesia, lime, and other substances equally refractory, are forced by it into a state of fusion. The diamond when placed in it becomes white hot, swells up, fuses, and is reduced to a black mass resembling coke. The electric light can be produced in a vacuum, and below the surface of water, oils, and other non-conducting liquids, and is thus quite independent of the action of the air.

In 1820, Oersted proved the identity of electricity and magnetism; but it remained for Faraday, in 1831, by his great discovery of induced currents, to render practicable the application of electricity to the production of good artificial light. It was not, however, until 1853, that the magneto-electric machine was actually applied to the purpose; and, in 1857, the first great practical trial took place, when Faraday had the satisfaction of seeing his conception carried into effect. This trial of Holmes' machine resulted in the E. L. being introduced into the South Foreland light-house on 8th Dec., 1858, and later the light was adopted at Dungeness. The French government adopted the light for two light-houses near Havre, in 1863.

The problems to be solved in the production of E. L., are to supply a constant and equal current (which battery electricity does not yield), and to provide a form of electrode which will not cause the light to blink or go out by wasting away. The first generating machines were "magneto-electric," revolving coils in front of permanent steel magnets (or contrariwise, revolving magnets in front of coils), but some later machines are "dynamo-electric," based on a discovery simultaneously made by Werner Siemens, Varley, and Wheatstone, that by revolving coils in front of soft iron electro-magnets, the residual magnetism in the iron would gradually be augmented, dynamic force being thus converted into electricity. The currents created by machines of either sort are alternate, but where, as in the case of some forms of lamp, the current must proceed in one direction, the alternate currents are made continuous by the use of a commutator. There are a large number of machines in use for generating currents for producing the E. L.; and for details reference may be made to Shoolbred's *Electric Lighting* (1879).

The invention of methods of using this powerful light received a great stimulus in 1876, when Jablochkoff's "candle" was invented. This electrode consists of two carbon pencils, $\frac{3}{16}$ inch in diameter, separated by a narrow strip of kaolin or plaster of Paris. The current passes alternately up each carbon, forming the arc at the extremity of the candle, the alternate currents causing each point to be in turn positive and negative, and thus to waste equally. The "Wilde candle" has no separating medium, the inventor having found that the light would run to the points spontaneously. By means of a magnet introduced into the circuit, the points are drawn separate when the current passes, and the light springs into existence. Should the light go out, the pencils fall together, and as the circuit is thereby completed, the points are at once separated again and the light is re-established. Rapieff's candle has the same merit of spontaneous lighting and regulation.

One of the most successful endeavors to solve the question of regulation of the light produced from the "arc" is the Wallace lamp. In this apparatus two carbon plates slide in a vertical frame. A rod extends from the upper plate by means of which it is drawn up on the passage of the current, and the light springs out at the point between the plates that occupies the proper position. When this point wastes, the light travels to another, passing thus slowly backwards and forwards along the carbons. It is claimed for this lamp that it will burn continuously for 100 hours, and by its durability it has solved one difficulty in the production of the electric light. The Serrin, Lontin, and Rapieff lamps are different arrangements for the production of light by means of the "arc," the adjustment of the carbons being effected by a combination of wheels and magnets through an electro-magnet.

The upper rod bearing a carbon pencil rests upon a second pencil, but, upon the passage of a current, it is raised by an electro-magnet which separates the carbons the distance necessary to produce the "arc."

When the carbons waste so that the light goes out, the magnet fails to act, the points come together, and the original process is repeated. The interval is so short, that only an almost imperceptible blink was seen in this lamp. In the later lamps great steadiness has been achieved.

The above described lamps and candles produce light in the form of the "voltaic arc," but a number of lamps have been produced which work entirely by incandescence of the electrodes. Werdermann's lamp produces light by the incandescence of a pencil of carbon pressed against a block of the same material, the latter forming the negative pole. In Reynier's lamp, a fine rod of carbon presses on a disk of carbon placed vertically and free to rotate. Edison's lamp depends for its action on the incandescence of fine particles of iridium, ruthenium, or other metal, held in solid form by magnetic oxide of iron or other substances not easily fused. The question of subdivision of the

light is still to be solved. To produce the current, a very steady engine is required, the endeavor to drive an electric machine by a large engine at Woolwich arsenal having shown that an engine on which the strain varies by machines being thrown into or out of gear does not give satisfactory results. During the year 1878, great progress was made in the adaptation of the electric light to street and workshop illumination; but it remains dearer than gas, and cannot at present (1879) be looked on as further than the stage of successful experiment.

ELECTRIC LIGHT (*ante*). The machines which are now used for generating the light-producing current are described in the article MAGNETO-ELECTRIC MACHINE. The more recent inventions of electrodes for producing light are those of Jablochkoff, Lodyguine, Kohn, Sawyer, and Edison. The first of these produces the light by the electric arc; the others by the incandescence of some refractory substance, as carbon or platinum.

The principal difference between the Jablochkoff light and the ordinary arrangement with carbon points is in a provision by which the current is reversed from time to time so that the more rapid consumption of the positive electrode is made to take place with one and the other point alternately. When the apparatus is started, there is also a slight bridge of carbon between the two points through which the current passes before the arc is established. The carbon rods are placed parallel and near together, so that a uniform distance may be maintained during their consumption. A pair of carbon points constitutes a "candle," and four candles are usually placed in a globe of opalescent glass. Each candle burns about one hour and a half, so that the set of four will give light about 6 hours, the change of electric action from one candle to another being accomplished by an automatic switch. The motive power required in the Jablochkoff lamp is about one-horse power applied to a magneto-electric machine for each candle, and each such candle is said to have a light value of 700 standard candles; but this, from the absorption of light by the opalescent glass, is reduced to that of 300 candles. In 1873, M. Lodyguine, a Russian as well as Jablochkoff, invented a lamp which gave light by rendering carbon incandescent by the electric current. A portion of the conducting rod of carbon was made much thinner than the rest, so that the increased electrical resistance in that part would cause it to become intensely incandescent. The carbon rod was inclosed in a glass vacuum chamber, but the apparatus was not practically successful, as the carbon wasted too rapidly, and required too frequent replacement within the vacuum chamber. In 1875, M. Kohn of St. Petersburg patented an arrangement intended to obviate this difficulty by a device having the same object as that in the Jablochkoff lamp, viz., to supply the place of the consumed carbon with a new piece. This lamp has been used with considerable success. The Sawyer lamp has the following characteristics: It employs the resistance of a small piece of carbon, placed in an air-tight glass cylinder filled with pure nitrogen, which, being a non-supporter of combustion, protects the carbon in a manner like that of a vacuum, the advantage claimed being that it is easier to keep a vessel full of pure nitrogen than to maintain a vacuum, because of the equality of the inward and outward pressure. The heat produced is prevented from reaching the mechanism at the base of the apparatus by having the copper standards present a great radiating surface. Diaphragms are also placed so as to cut off much of the downward heat rays, and a switch device is employed to prevent the too sudden turning on of the current, and thereby prevent crumbling by too sudden heating.

The experiments of Mr. Edison on the electric light have been in progress about two years, in which time he has used various substances for the incandescent material. He commenced with platinum, and employed a device by which the galvanic current would be reduced when the metal approached the melting point. This device consisted chiefly in placing within the fine platinum spiral a rod of the same metal which would be moved, on the principle of the pyrometer, one way or the other by a lever, and thus cool by its presence the incandescent spiral when it became too hot. But this device did not prove successful. Another arrangement employed heated air acting upon a diaphragm as the regulating power. The various metals which he used soon became oxidized and rendered useless. He then gave his attention to perfecting the vacuum employed by Lodyguine in 1873. Edison's platinum lamp as perfected consists of a long coil of platinum coated with calcined magnesia, supported by a platinum rod within a glass vacuum tube, which rests upon a metal frame containing the regulating apparatus. It is claimed that Edison has produced a vacuum more perfect than any other, so that only one millionth of an atmosphere remains. His attention was called from the use of platinum to that of small threads of carbon, made by charring cotton thread in a vacuum with the electric current. Light of great intensity was obtained in this way. He experimented with various forms of woody fiber, but finally found that nothing gave more satisfactory results than charred paper. Bristol card-board cut in the shape of a small horse-shoe, the strips being about 2 in. long, and an eight of an inch wide, and laid upon one another in an iron mold, being separated by tissue-paper. When the mold is packed, it is placed in an oven and gradually heated to 600°; afterwards, in a furnace, to a white heat. The carbonized product is then care-

fully removed and placed in a small glass globe, and made the resisting portion of the galvanic circuit; the globe is then exhausted and sealed air-tight.

ELECTRIC LOOM. See WEAVING (*ante*).

ELECTRIC TELEGRAPH. See TELEGRAPH.

ELECTRO-CHEMICAL ORDER OF THE ELEMENTS. When two metals are placed in contact and immersed in a solution capable of acting on one of them, an electric current is produced, positive electricity passing from the metal acted on, through the liquid, to the metal unacted on. See GALVANISM. The former metal is said to be *electro-positive* to the latter. By experimenting with different pairs, we can arrange the metals in electro-chemical order. This order depends upon the readiness with which the metals are acted upon by the solution, and is not the same for all solutions.

The following is the electro-chemical order of the more common metals, the liquid being dilute sulphuric or hydrochloric acid: Sodium, magnesium, zinc, iron, copper, silver, platinum. When a compound of two elements is electrolyzed (see GALVANISM), the electro-positive element appears at the negative electrode, and the electro-negative element at the positive electrode. It is impossible to make a single table of the electro-chemical order of the elements, as this is not the same under all circumstances, but it may be generally stated that oxygen is the most electro-negative element, and that next to it are the elements chlorine, bromine, fluorine, sulphur, etc., which form stable compounds with the metals.

ELECTRO-DYNAMIC ENGINE. See MAGNETO-ELECTRICITY and MAGNETO-ELECTRIC MACHINE, *ante*.

ELECTROLY'SIS, or ELECTRO-CHEMISTRY. See GALVANISM.

ELECTRO-MAGNETISM. See MAGNETISM and MAGNETO-ELECTRIC MACHINE.

ELECTRO-MET'ALLURGY. Within the last few years many advances have been made in the art of electro-metallurgy. Usually in electroplating, the silver presents a dull appearance when drawn out of the trough, requiring to be polished by a burnisher and a scratch-brush. If, however, bisulphide of carbon be added to the bath, or, better, if the article be dipped into a bath containing this liquid after immersion in the usual solution of silver, a thin but hard and bright layer of silver is deposited on the main layer, brilliant enough to do without polishing. There are certain difficulties in the process which render it only applicable in some circumstances.

Since 1869, the coating of other metals by an electro-deposit of nickel has been successfully carried out on a commercial scale, and is becoming extensively practiced both in England and the United States. It is usually deposited from a solution of sulphate of nickel neutralized by ammonia. Nickel has the hardness of iron, and though it lacks the beautiful color of silver, it has nevertheless an agreeable grayish-white color, and does not tarnish like silver in impure air, besides being only about one fifth part of its price. Numerous articles of iron, steel, brass, and German silver for household use, but especially for ships and hotels, have been plated with nickel in recent years.

Very beautiful electrotype copies of art objects can now be made of iron, and even, it is said, of steel. As a consequence of this, the art of engraving on steel will soon cease to be practiced, as copper-plates, which are less costly to engrave, can now be coated with an electro-deposit of iron which can be renewed at will; thus practically yielding an indefinite number of prints. In the same way engraved zinc plates can be coated with copper, in cases where a lesser number of impressions are required.

Attempts have often been made to coat iron with an electro-deposit of an alloy such as brass, bronze, or German silver, and with all of these it has been attended with more or less success. The difficulty lies in getting the solutions of two metals to be of exactly equal conducting power. By employing a solution containing both the oxides and the cyanides of copper and zinc, along with some tartrate of ammonia, a very even and compact deposit of brass can be obtained.

There is a process now in use for purifying impure or blister copper by electrolysis. The blister copper is cast into plates; these are placed in a solution of sulphate of copper, and form the anodes or positive poles of a battery. Particles of pure copper, by the action of the electric current, separate themselves from the crude plate of pimple metal, and attach themselves to the opposite or negative pole. By this means plates of pure copper are obtained, provided that the blister-copper contained no metals which will deposit along with it. The impurities fall down as a residue.

It sometimes happens that iron ores are found mixed with the ores of copper or zinc in the state of sulphides. In such a case there is a difficulty in separating them by the ordinary ore-dressing processes, owing to their being of nearly the same specific gravity. If, however, the iron ore happens to be magnetic, or can be changed into the black oxide by roasting, then its particles can be conveniently extracted from the mixture by electro-magnets.

The making of large copper or "bronze" statues by electro-deposit instead of by casting, is another department of the art which has made great strides. Messrs. Elkington have produced many statues in this way from 6 to 13½ ft. high. One of the earl of Eglinton weighs two tons. There is a trough or deposit-tank at the works of this cele-

brated firm, 15 ft. long, 9 ft. wide, and 9 ft. deep, that will contain 6,600 gallons of the copper solution.

The French are also making great progress in the art. M. Oudry has taken electrocasts of the bas-reliefs on Trajan's column at Rome, covering 700 sq. yards. He has also coated many thousands of the iron lamp-posts of Paris with copper by electrodeposit, as well as numerous fountains, etc., producing most of the good effects of bronze at a much smaller expense. This process of coating exposed iron with copper is not so much used as it might be. Few persons have any idea of the large extent of surface which even one halfpenny worth of copper will coat when deposited by the action of a galvanic battery from its solution either in the cyanide or chloride of potassium. See GALVANISM.

ELECTRO-MOTIVE MACHINES. See MAGNETO-ELECTRICITY.

ELECTROPHONE, an instrument devised by Dr. Strethill Wright for producing sound by electric currents of high tension. In its simplest form, the electrophone consists of two metallic plates separated by a sheet of cartridge-paper, the whole being closely pressed together by a heavy weight or screw. Such an instrument, when its plates are connected with the terminals of a small induction-coil, forms a sonorous condenser, the note of which varies with the rapidity of action in the electrotome or contact-breaker. The more complicated electrophone communicated to the royal Scottish society of arts, 25th April, 1864, by Dr. Wright, is composed of four curved plates of the thinnest sheet-zinc, each 2 by 4 ft., and each separated from its neighbor by a double layer of imitation silvered paper, the silvered sides being in apposition to the zinc. The first and third, and second and fourth plates are connected by fine wires, which also connect the instrument with the induction-coil. When this instrument is connected with a small coil, the terminals of which afford a spark almost inaudible, it becomes charged and discharged with each impulse of current, each charge being attended by a sonorous tap given out by the whole mass of metal thrown into vibration, and the rapid succession of taps producing a prolonged trumpet-note, the power of which may be increased by adding battery-power to the coil. The electrophone has been recommended by its author for use as a telegraphic relay capable of giving two or four signs with a single wire, with the advantage over other relays that perfection of contact was not necessary to its working. Fig. 1 shows the mode of working the electrophone as a double relay with four signals and the galvanometer of Thomson; A represents the needle of the galvanometer, B and C the wires communicating with an electrophone. When the needle is deflected to the right, it falls on the points B and C, and sounds the electrophone through B, A, C. The signals are produced by long and short contacts, as in the code of Morse. The second set of signals are produced by the reversal of the line-current, which throws the needle on the points of the arrangement D connected with a second electrophone of different tone. The electrophone has been employed as a lecture table instrument to report to a large audience results of processes which can only be rendered sensible by the most delicate galvanometric apparatus. Fig. 2 shows the adaptation of the electrophone to the galvanometer. AB represents the needle of the galvanometer suspended by a silk fiber, C; D is a small vessel of mercury communicating by a fine wire with the center of the needle; while a similar wire, attached to the end of the needle B, dips into the curved trough EF, containing distilled water. The wires inserted into D and F connect the coil with the electrophone, the current passing through F, E, B, D. When the needle is deflected, the tract of water between E and F is shortened, and the electrophone gives forth a gradually increasing sound. By a delicate system of levers attached to the wrist, as in the sphygmograph (q.v.), the rhythm and character of the human pulse, and its variation in disease, may be indicated to the class by the physician. Further, the electrophone may be adapted to the telephone by making the telephone membrane act the part of a make-and-break for the current circulating in the primary wire of induction-coil. This can easily be done by leading the current through the membrane, and through a spring carrying a platinum point, which presses lightly against a piece of platinum attached to the center of the membrane. If the sounds uttered into the telephone be sufficiently strong to make the membrane so to vibrate as to cause actual separation between the platinum surfaces, they will be reproduced with great loudness in the electrophone; but if, as in the case of speaking, they be merely able to cause variations of pressure at the surfaces, they will be but imperfectly heard. Hence the electrophone succeeds best with singing (see TELEPHONE), and a song gently sung in one place may be repeated in trumpet-tones in another hundreds of yards distant.

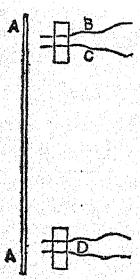

FIG. 1.

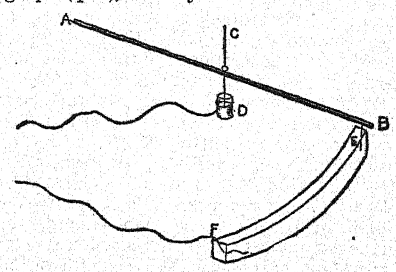

FIG. 2.

ELECTROPH'ORUS. This generally consists of a tin mold filled with shell-lac, and a movable metal cover, with a glass handle. The shell-lac is poured in when melted, and it is mixed with some other substance, to make it less brittle. Five parts of shellac, one of wax, and one of Venice turpentine, is given as a good mixture. When used, the surface of the cake of shell-lac is smartly beaten with a cat's fur or foxtail. The cover is then put on, and touched with the finger, which receives a slight spark of − electricity, just before contact takes place; and after the finger is removed, the cover, when lifted by its insulating handle, gives a brisk spark of + electricity to anything presented to it. This can be repeated for several minutes without any apparent exhaustion of the source of electricity; and in dry weather, sparks can be got in this way hours, and frequently days, after the cake has been beaten.

The action of the E. may be thus accounted for. When the surface of the cake of shell-lac is beaten, the friction excites − electricity on it. This acts inductively all round, but the tin mold being the nearest conductor, and shell-lac a good dielectric, the induction becomes concentrated on it, + electricity becoming fixed on the side next the shell-lac, and − electricity being sent to the ground. The − electricity of the upper surface of the shell-lac is thus fixed by the + electricity of the mold. When the cover is put on the cake, the contact between the two is not sufficient to allow the latter to communicate its charge to the former. The cover is thus acted on inductively, not conductively. The − electricity of the cake, then, has the choice of two channels for its induction, either through the cake to the mold, or through a very thin film of air to the cover. The latter, from its offering so short a passage through the dielectric, has the preference, and the inductive action of the charge is diverted from the mold to the cover, and the + electricity on the other side of the cake is thus liberated and lost in the ground. The cover being strongly polarized, + electricity is induced and fixed on its lower surface, and − electricity on its upper, this last being transmitted to the ground by the finger. When the finger is withdrawn, and then the cover, the + electricity of the latter is free to discharge itself by spark, and inductive action again takes the direction of the mold, once more attracting + electricity to it. The induced polarity of the cover is attended with no loss to the charge of the shell-lac, which can thus continue to act with the same efficiency. The loss of electricity that all charged bodies experience in air, and especially when moist, at length discharges the cake, but this takes place all the less readily, that when the electricity is not needed to act on the cover, it is kept bound by the + electricity induced by it in the mold. In order that the + electricity of the mold should have liberty, so to speak, to come and go, the E. must not be insulated; and when it is so, the action on the cover is feeble, if at all perceptible.

ELEC-TROPLATING—ELECTRO-TYPE. See GALVANISM.

ELECTROTYPE, PHOTOGRAPHIC. Much thought and labor have been expended in producing a relief-plate to take the place of wood-engraving, and various methods of etching on metal by the aid of photography have been brought to light. The earlier of these never were successful, because after the acid has eaten or etched below the surface protected by the asphaltum, there is nothing to prevent it from undermining the lines, as the acid will eat in one direction as well as another, thus weakening them to such an extent that they often break down in printing. With the gelatine process, the gelatine must be of a thickness compatible with the depth desired A gelatine of this thickness will become nearly, if not quite, insoluble before it is dry, through the action of bichromate alone. Also the color of the gelatine, after the bichromate has been added, is such as to prevent the action of light from penetrating to the proper depth in the time during which it can be exposed. These are the almost insurmountable reasons why a relief-plate in gelatine has not been obtained till the advent of a new process, called photo-electrotype. W. H. Mumler, of Boston, Mass., has now succeeded in overcoming these obstacles. After printing upon his gelatine, through a negative, the necessary time to secure all the details, the parts unaffected are dissolved away to a slight depth. The interstices are then filled with a black paste, when it is again exposed to light; the soluble parts that were protected by the opacity of the negative in the first printing are now protected from the action of light by the black paste that covers them. The second exposure may be continued for a length of time sufficient to allow the light to penetrate its entire depth; and the action of light being to render the gelatine insoluble, it can readily be seen that the protected parts can be dissolved away to the depth to which the light has penetrated. The gelatine relief is then placed in a drying closet for a few hours, when it becomes as hard as horn. From this an electrotype is taken in precisely the same manner as from a wood-cut. It is then mounted on mahogany blocks, type high, when it is ready for the press. The result is an electrotype plate with a surface as smooth as polished plate-glass, and a depth far exceeding that of ordinary wood-cuts. See PHOTOGRAPHIC ENGRAVING.

ELECTRUM is a term used to designate native gold as it is associated with silver. It is also applied to amber.

ELECTUARY (Lat. *eligere, electum*, I make choice), a form of medicinal preparation in which the remedy is enveloped or suspended in honey or syrup, so as to make a mixture of thick semi-fluid consistence.

ELEGIT, ESTATE BY, the right in lands which is enjoyed by one who has acquired the land under writ of elegit (q.v.).

ELEGIT, WRIT OF, a writ whereby a creditor in England can seize the lands of his debtor in satisfaction of his claim. Before the reign of Edward I., a creditor could not enforce a claim of debt against the lands. But by statute of Westminster the second, 13 Edw. I. c. 18, it was enacted that the goods and chattels of the debtor should first be appraised, and if these were not sufficient, that the half of the freehold lands of the debtor should be delivered to the creditor, to be held by him until the debt was paid out of the rents and profits thereof. By 1 and 2 Vict. c. 110, the whole of the lands, including copyhold and customary lands, are made subject to the debt. A creditor who has seized the lands, is not entitled to take the person of his debtor; for, as imprisonment for debt is practically abolished, except where fraud was used, this and *fieri facias* (q.v.) are the only remedy of creditors.

ELEGY (Gr. *elegeia*), according to its derivation, signifies, exclusively, a song of lamentation, but the term was employed at an early period by the Greeks to designate any poem written in distiches. The alternation, peculiar to this measure, of the hexameter, or strictly narrative verse, with the more fiery pentameter, gives to this whole species of poetry its individual character, which consists in the connection of subjective feelings and emotions with external incidents or objects. The E., therefore, can often be chiefly, but never altogether narrative. The effect of the measure is further shown in the circumstance, that earnest, long-sustained feelings, rarely violent passions, are expressed in the elegy. Of the numerous elegies of the Greeks, few have come down to us. Those still extant consist partly of encouragements to patriotism, as in Callinus and Tyrtæus, and partly of lessons of practical wisdom, as in Solon and Theognis. Sometimes also it expressed yearning desire or mild sorrow, or amorous complaints. This was especially the case at Alexandria. Among the Romans, Catullus was the first good elegiac writer; after him came Propertius, Tibullus, and Ovid. Tibullus, in particular, brought the erotic E. to its highest perfection. All are marked by the absence of political or moral feeling. They lived at a time when it was dangerous to express the one, and unfashionable to express the other—viz., the Augustan age. In modern times, the term E. is applied in England to any serious piece where a tone of melancholy pervades the sentiments, whether grief is actually expressed or not; as, for example, Gray's "*Elegy*, written in a country church-yard."

ELEGY, in music, is a composition depicting feelings of mourning, sadness, longing or ardent desire, and love.

ELEMENTAL SPIRITS, beings who, according to the popular belief of the middle ages, presided over the four "elements," living in and ruling them. The E. S. of fire were called salamanders; those of water, undines; those of the air, sylphs; and those of the earth, gnomes. These imaginary beings play a part in Pope's mock-heroic poem, *The Rape of the Lock.*

ELEMENTS, in astronomy, are those numerical quantities, and those principles deduced from astronomical observations and calculations, which are employed in the construction of tables exhibiting the planetary motions. They include the greatest, least, and mean distances of the planets from the sun, the eccentricities of their orbits, their mean motions, daily and annual, with the motions of their aphelia, and the inclinations of their orbits to the ecliptic; their masses and densities, etc. The E. of the different planets and of their satellites will be found under their names. The reader will find tables of the E. of all bodies in our system in most books on astronomy. See in particular Herschel's *Elements of Astronomy.*

ELEMENTS, CHEMICAL. The word elements has a very different signification in modern science from what it once had. The earliest of the Greek philosophers assumed either a single element, or several, the modifications and combinations of which they held to give rise to all the things that we see. The most common assumption was that of four elements —fire, air, water, and earth. This corresponds to the four forms under which modern science considers matter as existing—viz., imponderable, gaseous, liquid, and solid; while by elements are understood the simple component ingredients of bodies under whatever form they exist. Neither air, water, nor earth are elemonts in this sense, for they can be decomposed into simpler ingredients, and fire is a combination of light and heat. It is not pretended that any of the substances called elements are absolutely simple, that is, contain only one kind of matter; but only that hitherto they have not been decomposed. The number of so-called simple bodies, or elements, recognized by chemists is 64, of which some have been known from ancient times, such as the metals gold, silver, lead, copper, tin, and mercury; others are of more recent date; whilst quite lately two new metallic elements have been added to the list—viz., cæsium and rubidium, both of which were discovered by prof. Bunsen of Heidelberg, by the aid of the new branch of practical chemistry named *spectrum analysis.* The elements are divided into two great classes—the *non-metals* and *metals.* The latter are the more numerous class, there being altogether 51, whilst the non-metals number only 13. The following table gives the names of the elements at present known:

TABLE OF THE ELEMENTARY SUBSTANCES.

Non-metallic.

Oxygen.	Boron.	*Selenium.*	Bromine.
Hydrogen.	Silicon.	Phosphorus.	Iodine.
Nitrogen.	Sulphur.	Chlorine.	Fluorine.
Carbon.			

Metallic.

Potassium.	*Yttrium.*	Silver.	*Osmium.*
Sodium.	*Erbium.*	Mercury.	Antimony.
Lithium.	*Terbium.*	Copper.	Tin.
Cæsium.	*Cerium.*	Bismuth.	*Tungsten.*
Rubidium.	*Lanthanum.*	*Cadmium.*	*Molybdenum.*
Barium.	*Didymium.*	*Uranium.*	*Vanadium.*
Strontium.	Chromium.	Gold.	*Tantalum* (*Columbium*).
Calcium.	Zinc.	Platinum.	*Indium.*
Magnesium.	Manganese.	*Thallium.*	*Niobium.*
Aluminium.	Nickel.	*Palladium.*	*Titanium.*
Beryllium (*Glucinum*).	Cobalt.	*Rhodium.*	*Tellurium.*
Zirconium.	Iron.	*Iridium.*	Arsenic.
Thorium.	Lead.	*Ruthenium.*	

The more rare elements are printed in *italics*. Although the classification adopted above is a convenient one for the study of the elements, yet there is no decided line of demarkation between the metallic and non-metallic (otherwise called metalloid) series. The metals are generally recognized (1) by their power of reflecting light, as exhibited in the luster of burnished gold, and even in ordinary mirrors, which owe their power of reflecting light to the amalgam of the metals mercury and tin, present on the glass; (2) by their power of conducting heat; and (3) by their ready transmission of electricity. The non-metals or metalloids are regarded as not possessing all these three attributes. The non-metals carbon and silicon, however, in certain forms conduct electricity, whilst the metals arsenic and tellurium very closely resemble the metalloids in many of their properties. In the combinations of the various elements with each other, the non-metals constitute the electro-negative ingredient, and, as a rule, are insulators in the galvanic current; whilst the metals form the electro-positive element of the combination, and are conductors of the electric fluid. Again, in their combination with oxygen, the non-metals form more or less powerful acids, whilst the metals produce more or less powerful bases. At ordinary temperatures, five of the E. are gaseous—viz., oxygen, hydrogen, nitrogen, chlorine, and fluorine; two are liquid—viz., bromine and mercury; whilst the remaining 57 are solid.

ELEMENTS, CHEMICAL (*ante*). See CHEMISTRY, *ante*, and ATOMIC WEIGHTS, *ante*. Progress in chemical science presents the names of several substances which claim admission to the list of elements, with varying degrees of confidence. All are constituents of rare minerals, and none of them are likely to acquire much importance in practical affairs. The small quantities yet found have made the discussion of their oxygen compounds very difficult, and leave their appropriate atomic weights liable to different determinations.

The following list gives their status as known in Mar., 1880:

Name.	Symbol.	At. w't.	Discoverer and Remarks.
Terbium.....	Tb.	99.	Mosander in 1843, but discredited till recently, when shown to exist by M. Delafontaine.
Gallium.....	Ga.	69.9	Lecoq de Boisbaudran. White, sp. gr. 5.93.
Decipium.....	Dp.	114 171?	M. Delafontaine. The numbers 114 and 171 depend upon whether the oxide is DpO or Dp_2O_3.
Phillipium.....	Pp.	82 123?	M. Delafontaine.
Ytterbium.....	Yt.	116? 173.01	M. Marignac. L. F. Nilson thinks to show the atomic weight to be 132.
Scandium.....	Sc.	Undetermined.	L. F. Nilson in a Scandinavian mineral.
Norwegium.....	Ng.	145.9	Teleff Dahll, in copper-nickel, color white, melts at 350°C. Sp. gr. 9.441.

Other reported elements are: Mosandrium, a mixture of known metals; Ilmenium, probably a similar mixture; Neptunium, insufficiently characterized; Davyum, not authentic; Holmium is Phillipium; Thulium and Ouralium need confirmation. The revised weight of Thorium is 231.5 (oxide, TiO_2); Yttrium, 58.5 or 88.3; Erbium, 106 or 159; Indium, 113.4 (oxide In_2O_3).

E'LEMI, a fragrant resinous substance, obtained from different species of the natural order *amyridaceæ*. It was formerly brought chiefly from Egypt or Ethiopia, and was referred to a tree called *amyris elemifera*. Part of the E. of commerce is now brought from America, and is obtained from trees of other genera, but of the same natural order, particularly *icica icicariba*, which grows in Brazil and other warm parts of America. In dry weather, incisions are made in the bark, from which the resinous juice flows abundantly, and hardens in the sun. It is collected once a day, and put into casks. It is at first soft and unctuous, but becomes hard and brittle by age. *Elaphrium elemiferum* is believed to yield the greater part of the E. of Mexico. E. is usually in large, pale-yellow, semi-transparent masses, fragile, softening by the heat of the hand, with a smell somewhat resembling that of fennel. It is soluble in alcohol, except a white crystallizable residue, which is very light, inodorous, and tasteless, and which is called *elemine*. The properties of E., however, chiefly depend on a volatile oil, which may be obtained from it by distillation. E. is used in the preparation of stimulant plasters and ointments.

ELEPHANT, a geographical term of obvious origin, indicates various localities in Asia and Africa.—1. Elephant point, a promontory of Pegu, in Further India, marks the w. extremity of the mouth of the Rangoon, the most easterly arm of the Irrawaddy. It is in lat. 16° 28′ n., and long. 96° 25′ east.—2. Elephant bay, an inlet of the Atlantic, on the coast of Benguela, s.w. Africa, in lat. 13° 14′ s., and long. 12° 33′ e., has excellent anchorage, but no fresh water.—3. Elephant island, in Senegambia, is about 100 m. up the Gambia.—4. Elephant river, in the Cape Colony of South Africa, enters the Atlantic after a course of 140 m., about lat. 31½° s., and long. 18° east.

ELEPHANT (Gr. *elephas*), a genus of quadrupeds, of the order *pachydermata* (q.v.), and of the section *proboscidea*. Elephants are the largest existing land animals. The ordinary height at the shoulder is about 8 ft., but sometimes exceeds 10 feet. The weight of a large E. is about five tons, the body being very bulky in proportion to its height. To sustain this weight, it is furnished with limbs of colossal thickness and strength, which are also remarkably straight, each bone resting vertically on that beneath it. From the appearance of inflexibility presented by the limbs, arose the notion prevalent among the ancients, and throughout the middle ages, that the limbs are destitute of joints, and that consequently an E. cannot lie down to rest like another quadruped, and if it were to lie down, could not rise again, but always sleeps standing, or leaning against a tree. It is indeed true that the E. often sleeps standing, and when fatigued, falls asleep leaning against a rock or tree, against which it may have been rubbing itself. The flexibility of the limbs is, however, sufficient to permit elephants to run with speed nearly equal to that of a horse, to indulge in playful gambols, and to ascend and descend steep mountains. Elephants are more sure-footed and serviceable than either horses or mules, in difficult mountain roads. On the very steepest declivities, an E. works his way down pretty rapidly, even with a *howdah* and its occupants upon his back, his chest and belly on the ground, and each forefoot employed in making a hole for itself, into which the hind-foot afterwards follows it, and to which the weight may be trusted, that another step may be ventured with safety. In lying down, the E. does not bring his hind-legs under him, like the horse and other quadrupeds, but extends them backwards (as man does when he assumes the kneeling position), an arrangement which, "by enabling him to draw the hind-feet gradually under him, assists him to rise almost without a perceptible effort." The E.'s pace, when exceeding a walk, is neither a trot nor a gallop, which would be too violent a motion for its conformation and huge body, but a sort of shuffle, the speed of which is increased or diminished without other alteration. The E. is incapable of springing like the deer, horse, and other animals which have the bones of their shoulders and hocks set at an angle.

The head in elephants is large; the neck is short and thick, the long flexible proboscis compensating both for the shortness of the neck, and for the inflexibility caused by the largely developed processes of its vertebræ, and enabling the animal readily to reach objects on the ground, or to a height of several feet above its head, or on either side. A great extent of bony surface in the head affords attachment for muscles destined to move and give power to the proboscis or trunk. This extent of bony surface is provided in a remarkable manner, which at the same time makes the head, heavy as it is, lighter in proportion to its bulk than is usual in quadrupeds; a great space separating the internal and external tables of all the bones of the skull, except the occipital bones, so that the space occupied by the brain is but a small part of the whole head. The space between the tables of the bones is occupied by cells, some of which are 4 or 5 in. in length; others are small, irregular, and honeycomb-like; "these all communicate with each other, and through the frontal sinuses with the cavity of the nose, and also with the tympanum or drum of each ear; consequently, as in some birds, these cells are filled with air." The huge and extraordinary bones of the skull, besides affording attachment for muscles, afford mechanical support to the tusks.

The nasal bones of the E. are scarcely more than rudimentary; but the tapering proboscis, to the very extremity of which the nostrils are prolonged, is nearly 8 ft. in length. Besides the great muscles connected with it at its base, it is composed of a vast multitude of small muscles variously interlaced, but chiefly either longitudinal, and divided into successive arcs, of which the convexity is outwards, or transverse, and

radiating from the internal to the external membrane. Cuvier states the number of muscles having the power of distinct action as not far short of 40,000. The trunk can be coiled around a tree, and employed to tear it from its roots; it is a formidable weapon of offense or defense, and is far more employed in this way than the tusks, even by those elephants which have tusks of great size; its extremity can be wound around a small handful of grass or a slender branch; it is even capable of plucking the smallest leaf, or of lifting a pin from the ground. To fit it for such actions as those last mentioned, and for many such as might be performed by a hand, it is furnished at the extremity with what may be likened to a finger and thumb; on the upper side, an elongated process—strong, soft, and flexible, like the rest of the trunk, and endowed with the most delicate sense of touch—on the under side, a kind of tubercle against which this process may be pressed. All the food of the E. is gathered and conveyed to the mouth by the trunk: by means of the trunk, also, it drinks, sucking up into it a quantity of water sufficient to fill it, and then discharging the contents into the mouth. Valves at the base of the trunk prevent the water from going too far up the nostrils. The trunk is constantly employed by elephants in providing in many ways for their comfort or enjoyment, as in throwing dust over their backs, or in fanning themselves and switching away flies with a leafy branch, two practices to which they are greatly addicted. Their mutual caresses are also managed by means of the trunk, and through it they make a loud shrill sound, indicative of rage, which is described by Aristotle as resembling the hoarse sound of a trumpet, and from which this organ received its French name *trompe*, corrupted in English into trunk. With the trunk, also, they sometimes, when angry, beat violently on the ground.

The sense of smell is very acute in the E., as is also that of hearing. The ears are large and pendulous; the eyes are small.

Elephants have no canine teeth, nor have they any incisors in the lower jaw. The upper jaw is furnished with two incisors, which assume the peculiar character of tusks, and attain an enormous size, a single tusk sometimes weighing 150 or even 300 pounds. The tusks are, however, often imperfectly developed, 10 or 12 in. in length, and 1 or 2 in diameter. These stunted tusks are often used for such purposes as snapping off small branches and tearing climbing plants from trees. Those elephants which possess great tusks employ them also for such other uses as loosening the roots of trees which they cannot otherwise tear from the ground; or in a state of domestication, for such labors as moving great stones, and piling or carrying timber. A powerful E. will raise and carry on his tusks a log of half a ton weight or more. The tusks of the E. surpass in size all other teeth of existing animals, and are the largest of all teeth in proportion to the size of the body. They consist chiefly of that variety of *dentine* called ivory (q. v.), and continue to grow—like the incisors of the rodents, to which they are in some respects analogous—even when the animal has attained a great age, if not to the very end of its life. The young E. is at first furnished with deciduous incisors, which are shed between the first and second year, and are succeeded by the permanent tusks.—The molar teeth of the E. are developed in succession; and at least in the Indian E., never more than two are to be seen in the same side of a jaw at one time. The first molars cut the gum in about two weeks after birth, and are shed about the end of its second year. The sixth molars, which are also believed to be the last, are supposed to appear about the fiftieth year of the E.'s life. The molar teeth of the E. are remarkable for their great size, and for the extreme complexity of their structure, to which the nearest resemblance is found in some of the small rodents. They are composed of vertical plates of bony substance, separately enveloped in enamel, and cemented together by a third substance, called *crusta petrosa*, *cortical*, or *cement*, more resembling bone than enamel. Each succeeding tooth is not only more complex, but occupies a greater space in the jaw than its predecessor. Although formed from a single pulp, the molar tooth of an E. resembles an aggregation of teeth; and in the earlier stages of its growth, when the cement is not yet deposited, it seems as if many separate teeth were soldered together. As the surface of the tooth is worn down by mastication, the harder enamel is exposed in elevated ridges. The whole of a tooth is not in employment at once. From the peculiar manner of its growth, the anterior part begins to be employed, and to be worn away, whilst the latter part is still in process of formation.

The digestive apparatus of the E. is similar to that of the other pachydermata; but the stomach, which is of a very lengthened and narrow form, exhibits a peculiarity which assimilates it to that of the camel; the internal membrane, at the extremity beyond the cardiac orifice, forming thick wrinkles and folds, the broadest of which, and nearest to the gullet, seems to act as a valve, making that end of the stomach a reservoir for water, capable of containing about ten gallons; whilst a peculiar muscle, connecting the windpipe and gullet, enables the animal to open this reservoir at pleasure, for the regurgitation of the fluid, which is then sometimes received into the trunk, and squirted over the body, to free it from the nuisance of flies or the heat of a tropical sun.

The female E. has only two teats, situated between the fore-legs. The young suck with the mouth, and not with the trunk. They are suckled for about two years. The period of gestation is also nearly two years, and a single young one is produced at a birth.

The skin of the E. is very thick, of a dark-brown color, and in the existing species has scarcely any covering of hair. The tail does not reach to the ground, and has a tuft of coarse bristles at the end. The feet have in the skeleton five distinct toes, but these are so surrounded with a firm horny skin that only the nails are visible externally, as on the margin of a kind of hoof. The foot of the E. is admirably adapted for steep and rough ground, the protective skin which covers the toes allowing them considerable freedom of motion.

Only two existing species of E. are certainly known, the Indian (*E. Indicus*) and the African (*E. Africanus*), although differences have recently been observed in the E. of Sumatra, which may perhaps entitle it to be ranked as a distinct species. Elephants are found in all parts of Africa, from the Sahara southwards, where wood and water are sufficiently abundant; also throughout India and the south-eastern parts of Asia, and in some of the tropical Asiatic islands. They extends northwards to the Himalaya; and Chittagong and Tiperah vie with Ceylon in the superior excellence of the elephants which they produce. The Indian E. is distinguished by a comparatively high oblong head, with a concave forehead; whilst the African has a round head and convex forehead. The ears of the African E. are much larger than those of the Indian, covering the whole shoulder, and descending on the legs. A marked distinction of the two species is also found in the molar teeth; those of the Indian E. exhibiting *wavy parallel transverse ridges;* whilst those of the African species have the divisions of the crown of the tooth fewer, broader, and *lozenge-shaped.*

Elephants live in herds, not generally numerous, but several herds often congregate together in the same forest or at the same place of drinking. Each herd has a leader, generally the largest and most powerful animal. The leader seems to exercise much control over the movements of the herd; gives the alarm in case of danger, and seems to examine and decide for the whole herd as to the safety of proceeding in any particular direction. On account of his tusks, the leader is very often the animal against which the efforts of the hunter are directed; but the rest of the herd do their utmost to protect him, and when driven to extremity, they place him in the center, and crowd so eagerly to the front of him that some of them must often be shot ere he can be reached. A family resemblance is usually very visible among the elephants of the same herd; some herds are distinguished by greater stature, and others by more bulky form and stronger limbs; some by particularly large tusks, some by slight peculiarities of the trunk, etc. In the East Indies, distinctions of this kind have long been carefully noticed, and particular names are given to elephants according to them, some being considered as *high-caste,* and others as *low-caste* elephants. An E. which by any cause has been separated from its herd, seems never to be admitted into another, and these solitary elephants are particularly troublesome, in their depredations exhibiting an audacity which the herds never exhibit; they are also savage and much dreaded, whilst from a herd of elephants danger is scarcely apprehended. The E. is generally one of the most inoffensive of animals, although in a state of domestication, it shows, as is well known, a power both of remembering and resenting an injury.

The favorite haunts of wild elephants are in the depths of forests—particularly in mountainous regions—where they browse on branches, and from which they issue chiefly in the cool of the night to pasture in the more open grounds. They are ready to plunder rice or other grain-fields, if not deterred by fences, of which, fortunately, they have, in general, an unaccountable dread, even although rather imaginary than real. A fence of mere reeds will keep them out of fields, where, as soon as the grain is removed, they enter by the gaps of the fence, and may be seen gleaning among the stubble.

When the E. eats grass, "nothing can be more graceful than the ease with which, before conveying it to his mouth, he beats the earth from its roots by striking it on his fore-leg." A cocoa-nut is first rolled under foot, to detach the outer bark, then stripped of the fibrous husk, and finally crushed between the grinders, when the fresh milk is swallowed with evident relish. The fruit of the palmyra palm is another favorite food of elephants, and they seem to have an instinctive knowledge of the time of its ripening. Sugar-canes are also a favorite food; indeed, elephants are very fond of sweet things. Those which are brought to Britain are generally fed on hay and carrots. The amount of daily food necessary for the E. in a state of domestication may be stated, on an average, at about 200 lbs. in weight.

Elephants delight in abundance of water, and enter it very freely, often remaining in it for a considerable time and with great evident enjoyment. They sometimes swim with not only the body but the head under water, the only part elevated above it being the extremity of the trunk.

The habits of the African E. appear in no important respect to differ from those of the Indian elephant. It is the latter only that is at the present day domesticated; but it is certain that the African species was anciently domesticated, and the figures on many Roman medals attest it.

Elephants rarely breed in a state of domestication, although, a few years ago, the birth of an E. took place in the zoological gardens of London, an occasion of much interest not only to the scientific but to the general public. They are generally tamed within a few months after they are captured; some degree of severity being employed

at first, which, however, as soon as the animal has begun to respect the power of man, is exchanged for kindness and gentleness of treatment. Elephants intended for domestication are captured in various ways. It was formerly common to take them in pitfalls, but in this way they were often much injured. Another method frequently practised is by the aid of tame elephants. Male elephants chiefly are captured in this way, the decoy elephants employed being females, trained for the purpose. With these the hunters very cautiously approach the animal they mean to capture, and he generally permits them to come up to him, and is so pleased to make the acquaintance of the female, that he takes no notice of their riders and other human attendants. Two of the females take their places, one on each side of him, and whilst he is occupied with them, men, the profession of whose lives it is, and who display a wonderful expertness in the work, contrive to get beneath their bodies, and to pass ropes round the legs of the intended captive. His two hind-legs are fastened together by 6 or 8 ropes in the form of the figure 8, another rope keeping them tight at the intersections, and a strong cable with a running-noose is attached to each hind-leg. About twenty minutes are usually spent in fixing the necessary ropes, profound silence being maintained if the process goes on unobserved, or some of the other hunters distracting the attention of the E. from those who are engaged in this work; and when at last, becoming sensible of his danger, he tries to retreat, an opportunity is soon found of tying him, by means of the long cables which trail behind him, to some tree strong enough for the purpose. His fury then becomes ungovernable, and he makes violent and prodigious efforts to get free, throwing himself on the ground, and twisting himself into the most extraordinary positions. It is not until he has thoroughly exhausted himself, and begins to suffer severely from fatigue, thirst, and hunger, that the next steps are taken towards taming him and making him a willing servant of man.

Still more wonderful is the capture of a wild E., sometimes by not more than two hunters, who for this purpose will go into the woods, without aid or attendants, their only weapon a flexible rope of hide. With this they secure one of the E.'s hind-legs, following his footsteps when in motion, or stealing close up to him when at rest, or sometimes spreading the noose on the ground, partially concealed by roots and leaves, beneath a tree on which one of the party is stationed, whose business it is to lift it suddenly by means of a cord. When arrested by the rope being coiled around a tree, the E. naturally turns upon the man who is engaged in making it fast, but his companion interferes on his behalf, by provoking the animal; and thus not only is the first rope made fast, but noose after noose is passed over the legs, until all are at last tied to trees, and the capture is complete; upon which the hunters build a booth for themselves in front of their prisoner, kindle their fires for cooking, and remain day and night till the E. is sufficiently tamed to be led away.

But these huge animals are not always captured singly; whole herds are often taken at once. This is accomplished by means of an inclosure, towards which the elephants are driven by great numbers of men encircling a considerable space, and contracting the circle by slow degrees. Weeks, or even months, are spent in this operation, and at last the elephants, hemmed in on every side except the mouth of the inclosure, enter it, and the gate is immediately closed. The modes of constructing the inclosure are different in different parts of the east. Tame elephants are sometimes sent into it, and the captives are in succession made fast to trees there, in a way somewhat similar to that practiced in capturing single elephants.

The E. first became known in Europe from its employment in the wars of the east: "in India, from the remotest antiquity, it formed one of the most picturesque, if not of the most effective, features in the armies of the native princes." Elephants have been taught to cut and thrust with a kind of scimitar carried in the trunk, and it was formerly usual for them to be sent into battle, covered with armor, and bearing towers on their backs, which contained warriors. But the principal use of the E. in war is for carrying baggage, and for dragging guns. An E. will apply his forehead to a cannon, and urge it through a bog, through which it would be almost impossible for men and cattle to drag it; or he will wind his trunk round it, and lift it up, whilst horses or cattle drag it forwards. Elephants are used in the east for carrying persons on their backs, a number being seated together in a *howdah*, whilst the driver (*mahout*) sits on the E.'s neck, directing it by his voice and by a small goad. Elephants have always a conspicuous place in the great processions and state displays of eastern princes, and white elephants—albinos—are peculiarly valued. Elephants are also employed in many kinds of labor, and display great sagacity in comprehending the nature of their task and adapting themselves to it. In piling timber, the E. "manifests an intelligence and dexterity which is surprising to a stranger, because the sameness of the operation enables the animal to go on for hours disposing of log after log, almost without a hint or direction from his attendant."

Of the sagacity of the E., many interesting anecdotes are on record, as every reader of books of travels and of natural history knows. But Cuvier refuses, and apparently with justice, to ascribe to it a degree of sagacity higher than that of the dog. In a state of domestication, the E. is a delicate animal, requiring much watchfulness and care, although naturally it has a very long life, and instances are on record of extreme lon-

gevity in domestication, extending not only to more than one hundred, but almost to two hundred years.
